THE ART OF THE DETECTIVE STORY

THE status in the world of letters of that type of fiction which finds its principal motive in the unravelment of crimes or similar intricate mysteries presents certain anomalies. By the critic and the professedly literary person the detective story—

to adopt the unprepossessing name by which this class of fiction is now universally known—is apt to be dismissed contemptuously as outside the pale of literature, to be conceived of as a type of work produced by half-educated and wholly incompetent writers for consumption by office boys, factory girls, and other persons devoid of culture and literary taste.

That such works are produced by such writers for such readers is an undeniable truth; but in mere badness of quality the detective story holds no monopoly. By similar writers and for similar readers there are produced love stories, romances, and even historical tales of no better quality. But there is this difference: that, whereas the place in literature of the love story or the romance has been determined by the consideration of the masterpieces of each type, the detective story appears to have been judged by its failures. The status of the whole class has been fixed by an estimate formed from inferior samples.

What is the explanation of this discrepancy? Why is it that, whereas a bad love story or romance is condemned merely on its merits as a defective specimen of a respectable class, a detective story is apt to be condemned without trial in virtue of some sort of assumed original sin? The assumption as to the class of reader is manifestly untrue. There is no type of fiction that is more universally popular than the detective story. It is a familiar fact that many famous men have found in this kind of reading their favourite recreation, and that it is consumed with pleasure, and even with enthusiasm, by many learned and intellectual men, not infrequently in preference to any other form of fiction.

This being the case, I again ask for an explanation of the contempt in which the whole genus of detective fiction is held by the professedly literary. Clearly, a form of literature which arouses the enthusiasm of men of intellect and culture can be affected by no inherently base quality. It cannot be foolish, and is unlikely to be immoral. As a matter of fact, it is neither. The explanation is probably to be found in the great proportion of failures; in the tendency of the tyro and the amateur perversely to adopt this difficult and intricate form for their ‘prentice efforts; in the crude literary technique often associated with otherwise satisfactory productions; and perhaps in the falling off in quality of the work of regular novelists when they experiment in this department of fiction, to which they may be adapted neither by temperament nor by training.

Thus critical judgment has been formed, not on what the detective story can be and should be, but on what it too frequently was in the past when crudely and incompetently done. Unfortunately, this type of work is still prevalent; but it is not representative. In late years there has arisen a new school of writers who, taking the detective story seriously, have set a more exacting standard, and whose work, admirable alike in construction and execution, probably accounts for the recent growth in popularity of this class of fiction. But, though representative, they are a minority; and it is still true that a detective story which fully develops the distinctive qualities proper to its genus, and is, in addition, satisfactory in diction, in background treatment, in characterization, and in general literary workmanship is probably the rarest of all forms of fiction.

The rarity of good detective fiction is to be explained by a fact which appears to be little recognized either by critics or by authors; the fact, namely, that a completely executed detective story is a very difficult and highly technical work, a work demanding in its creator the union of qualities which, if not mutually antagonistic, are at least seldom met with united in a single individual. On the one hand, it is a work of imagination, demanding the creative, artistic faculty; on the other, it is a work of ratiocination, demanding the power of logical analysis and subtle and acute reasoning; and, added to these inherent qualities, there must be a somewhat extensive outfit of special knowledge. Evidence alike of the difficulty of the work and the failure to realize it is furnished by those occasional experiments of novelists of the orthodox kind which have been referred to, experiments which commonly fail by reason of a complete misunderstanding of the nature of the work and the qualities that it should possess.

A widely prevailing error is that a detective story needs to be highly sensational. It tends to be confused with the mere crime story, in which the incidents—tragic, horrible, even repulsive—form the actual theme, and the quality aimed at is horror—crude and pungent sensationalism. Here the writer’s object is to make the reader’s flesh creep; and since that reader has probably, by a course of similar reading, acquired a somewhat extreme degree of obtuseness, the violence of the means has to be progressively increased in proportion to the insensitiveness of the subject. The sportsman in the juvenile verse sings:

\[
I\ shoot\ the\ hippopotamus\ with\ bullets\ made\ of\ platinum \\
Because\ if\ I\ use\ leaden\ ones\ his\ hide\ is\ sure\ to\ flatten\ 'em;
\]

and that, in effect, is the position of the purveyor of gross sensationalism. His purpose is, at all costs, to penetrate his reader’s mental epidermis, to the density of which he must needs adjust the weight and velocity of his literary projectile.

Now no serious author will complain of the critic’s antipathy to mere sensationalism. It is a quality that is attainable by the least gifted writer and acceptable to the least critical reader; and, unlike the higher qualities of literature, which beget
in the reader an increased receptiveness and more subtle appreciation, it creates, as do drugs and stimulants, a tolerance which has to be met by an increase of the dose. The entertainments of the cinema have to be conducted on a scale of continually increasing sensationalism. The wonders that thrilled at first become commonplace, and must be reinforced by marvels yet more astonishing. Incident must be piled on incident, climax on climax, until any kind of construction becomes impossible. So, too, in literature. In the newspaper serial of the conventional type, each instalment of a couple of thousand words, or less, must wind up with a thrilling climax, blandly ignored at the opening of the next instalment; while that ne plus ultra of wild sensationalism, the film novel, in its extreme form is no more than a string of astonishing incidents, unconnected by any intelligible scheme, each incident an independent “thrill,” unexplained, unprepared for; devoid alike of antecedents and consequences.

Some productions of the latter type are put forth in the guise of detective stories, with which they apparently tend to be confused by some critics. They are then characterized by the presentation of a crime—often in impossible circumstances which are never accounted for—followed by a vast amount of rushing to and fro of detectives or unofficial investigators in motor cars, aeroplanes, or motor boats, with a liberal display of revolvers or automatic pistols and a succession of hair-raising adventures. If any conclusion is reached, it is quite unconvincing, and the interest of the story to its appropriate reader is in the incidental matter, and not in the plot. But the application of the term “detective story” to works of this kind is misleading, for in the essential qualities of the type of fiction properly so designated they are entirely deficient. Let us now consider what those qualities are.

The distinctive quality of a detective story, in which it differs from all other types of fiction, is that the satisfaction that it offers to the reader is primarily an intellectual satisfaction. This is not to say that it need be deficient in the other qualities appertaining to good fiction: in grace of diction, in humour, in interesting characterization, in picturesqueness of setting or in emotional presentation. On the contrary, it should possess all these qualities. It should be an interesting story, well and vivaciously told. But whereas in other fiction these are the primary, paramount qualities, in detective fiction they are secondary and subordinate to the intellectual interest, to which they must be, if necessary, sacrificed. The entertainment that the connoisseur looks for is an exhibition of mental gymnastics in which he is invited to take part; and the excellence of the entertainment must be judged by the completeness with which it satisfies the expectations of the type of reader to whom it is addressed.

Thus, assuming that good detective fiction must be good fiction in general terms, we may dismiss those qualities which it should possess in common with all other works of imagination and give our attention to those qualities in which it differs from them and which give to it its special character. I have said that the satisfaction which it is designed to yield to the reader is primarily intellectual, and we may now consider in somewhat more detail the exact nature of the satisfaction demanded and the way in which it can best be supplied. And first we may ask: What are the characteristics of the representative reader? To what kind of person is a carefully constructed detective story especially addressed?

We have seen that detective fiction has a wide popularity. The general reader, however, is apt to be uncritical. He reads impartially the bad and the good, with no very clear perception of the difference, at least in the technical construction. The real connoisseurs, who avowedly prefer this type of fiction to all others, and who read it with close and critical attention, are to be found among men of the definitely intellectual class: theologians, scholars, lawyers, and to a less extent, perhaps, doctors and men of science. Judging by the letters which I have received from time to time, the enthusiast par excellence is the clergyman of a studious and scholarly habit.

Now the theologian, the scholar and the lawyer have a common characteristic: they are all men of a subtle type of mind. They find a pleasure in intricate arguments, in dialectical contests, in which the matter to be proved is usually of less consideration than the method of proving it. The pleasure is yielded by the argument itself and tends to be proportionate to the intricacy of the proof. The disputant enjoys the mental exercise, just as a muscular man enjoys particular kinds of physical exertion. But the satisfaction yielded by an argument is dependent upon a strict conformity with logical methods, upon freedom from fallacies of reasoning, and especially upon freedom from any ambiguities as to the data.

By schoolboys, street-corner debaters, and other persons who are ignorant of the principles of discussion, debates are commonly conducted by means of what we may call “argument by assertion.” Each disputant seeks to overwhelm his opponent by pelting him with statements of alleged fact, each of which the other disputes, and replies by discharging a volley of counterstatements, the truth of which is promptly denied. Thus the argument collapses in a chaos of conflicting assertions. The method of the skilled dialectician is exactly the opposite of this. He begins by making sure of the matter in dispute and by establishing agreement with his adversary on the fundamental data. Theological arguments are usually based upon propositions admitted as true by both parties; and the arguments of counsel are commonly concerned, not with questions of fact, but with the consequences deducible from evidence admitted equally by both sides.

Thus the intellectual satisfaction of an argument is conditional on the complete establishment of the data. Disputes on questions of fact are of little, if any, intellectual interest; but in any case an argument—an orderly train of reasoning—cannot begin until the data have been clearly set forth and agreed upon by both parties. This very obvious truth is continually lost sight of by authors. Plots, i.e., arguments, are frequently based upon alleged “facts”—physical, chemical, and other—which the educated reader knows to be untrue, and of which the untruth totally invalidates conclusions drawn from them and thus destroys the intellectual interest of the argument.

The other indispensable factor is freedom from fallacies of reasoning. The conclusion must emerge truly and inevitably from the premises; it must be the only possible conclusion, and must leave the competent reader in no doubt as to its
unimpeachable truth.

It is here that detective stories most commonly fail. They tend to be pervaded by logical fallacies, and especially by the fallacy of the undistributed middle term. The conclusion reached by the gifted investigator, and offered by him as inevitable, is seen by the reader to be merely one of a number of possible alternatives. The effect when the author’s “must have been” has to be corrected by the reader into “might have been” is one of anti-climax. The promised and anticipated demonstration peter out into a mere suggestion; the argument is left in the air and the reader is balked of the intellectual satisfaction which he was seeking.

Having glanced at the nature of the satisfaction sought by the reader, we may now examine the structure of a detective story and observe the means employed to furnish that satisfaction. On the general fictional qualities of such a story we need not enlarge excepting to contest the prevalent belief that detective fiction possesses no such qualities. Apart from a sustained love interest—for which there is usually no room—a detective novel need not, and should not, be inferior in narrative interest or literary workmanship to any other work of fiction. Interests which conflict with the main theme and hinder its clear exposition are evidently inadmissible; but humour, picturesque setting, vivid characterization and even emotional episodes are not only desirable on aesthetic grounds, but, if skilfully used, may be employed to distract the reader’s attention at critical moments in place of the nonsensical “false clues” and other exasperating devices by which writers too often seek to confuse the issues. The Mystery of Edwin Drood shows us the superb fictional quality that is possible in a detective story from the hand of a master.

Turning now to the technical side, we note that the plot of a detective novel is, in effect, an argument conducted under the guise of fiction. But it is a peculiar form of argument. The problem having been stated, the data for its solution are presented in conspicuously and in a sequence purposely dislocated so as to conceal their connexion; and the reader’s task is to collect the data, to rearrange them in their correct logical sequence and ascertain their relations, when the solution of the problem should at once become obvious. The construction thus tends to fall into four stages: (1) statement of the problem; (2) production of the data for its solution (“clues”); (3) the discovery, i.e., completion of the inquiry by the investigator and declaration by him of the solution; (4) proof of the solution by an exposition of the evidence.

1. The problem is usually concerned with a crime, not because a crime is an attractive subject, but because it forms the most natural occasion for an investigation of the kind required. For the same reason—suitability—crime against the person is more commonly adopted than crime against property; and murder—actual, attempted or suspected—is usually the most suitable of all. For the villain is the player on the other side; and since we want him to be a desperate player, the stakes must be appropriately high. A capital crime gives us an adversary who is playing for his life, and who consequently furnishes the best subject for dramatic treatment.

2. The body of the work should be occupied with the telling of the story, in the course of which the data, or “clues,” should be produced as inconspicuously as possible, but clearly and without ambiguity in regard to their essentials. The author should be scrupulously fair in his conduct of the game. Each card as it is played should be set down squarely, face upwards, in full view of the reader. Under no circumstances should there be any deception as to the facts. The reader should be quite clear as to what he may expect as true. In stories of the older type, the middle action is filled out with a succession of false clues and with the fixing of suspicion first on one character, then on another, and again on a third, and so on. The clues are patiently followed, one after another, and found to lead nowhere. There is feverish activity, but no result. All this is wearisome to the reader and is, in my opinion, bad technique. My practice is to avoid false clues entirely and to depend on keeping the reader occupied with the narrative. If the ice should become uncomfortably thin, a dramatic episode will distract the reader’s attention and carry him safely over the perilous spot. Devices to confuse and mislead the reader are bad practice. They deaden the interest, and they are quite unnecessary; the reader can always be trusted to mislead himself, no matter how plainly the data are given. Some years ago I devised, as an experiment, an inverted detective story in two parts [“The Case of Oscar Brodski”]. The first part was a minute and detailed description of a crime, setting forth the antecedents, motives, and all attendant circumstances. The reader had seen the crime committed, knew all about the criminal, and was in possession of all the facts. It would have seemed that there was nothing left to tell. But I calculated that the reader would be so occupied with the crime that he would overlook the evidence. And so it turned out. The second part, which described the investigation of the crime, had to most readers the effect of new matter. All the facts were known; but their evidential quality had not been recognized.

This failure of the reader to perceive the evidential value of facts is the foundation on which detective fiction is built. It may generally be taken that the author may exhibit his facts fearlessly provided only that he exhibits them separately and unconnected. And the more boldly he displays the data, the greater will be the intellectual interest of the story. For the tacit understanding of the author with the reader is that the problem is susceptible of solution by the latter by reasoning from the facts given; and such solution should be actually possible. Then the data should be produced as early in the story as is practicable. The reader should have a body of evidence to consider while the tale is telling. The production of a leading fact near the end of the book is unfair to the reader, while the introduction of capital evidence—such as that of an eye-witness—at the extreme end is radically bad technique, amounting to a breach of the implied covenant with the reader.

3. The “discovery,” i.e., the announcement by the investigator of the conclusion reached by him, brings the inquiry formally to an end. It is totally inadmissible thereafter to introduce any new matter. The reader is given to understand that he now has before him the evidence and the conclusion, and that the latter is contained in the former. If it is not, the construction has failed, and the reader has been cheated. The “discovery” will usually come as a surprise to the reader and will thus form the dramatic climax of the story, but it is to be noted that the dramatic quality of the climax is strictly
dependent on the intellectual conviction which accompanies it. This is frequently overlooked, especially by general novelists who experiment in detective fiction. In their eagerness to surprise the reader, they forget that he has also to be convinced. A literary friend of mine, commenting on a particularly conclusive detective story, declared that “the rigid demonstration destroyed the artistic effect.” But the rigid demonstration was the artistic effect. The entire dramatic effect of the climax of a detective story is due to the sudden recognition by the reader of the significance of a number of hitherto uncomprehended facts; or if such recognition should not immediately occur, the effect of the climax becomes suspended until it is completed in the final stage.

4. Proof of the solution. This is peculiar to “detective” construction. In all ordinary novels, the climax, or denouement, finishes the story, and any continuation is anti-climax. But a detective story has a dual character. There is the story, with its dramatic interest, and enclosed in it, so to speak, is the logical problem; and the climax of the former may leave the latter apparently unsolved. It is then the duty of the author, through the medium of the investigator, to prove the solution by an analysis and exposition of the evidence. He has to demonstrate to the reader that the conclusion emerged naturally and reasonably from the facts known to him, and that no other conclusion was possible.

If it is satisfactorily done, this is to the critical reader usually the most interesting part of the book; and it is the part by which he—very properly—judges the quality of the whole work. Too often it yields nothing but disappointment and a sense of anticlimax. The author is unable to solve his own problem. Acting on the pernicious advice of the pilot in the old song to “Fear not, but trust in Providence,” he has piled up his mysteries in the hope of being able to find a plausible explanation; and now, when he comes to settle his account with the reader, his logical assets are nil. What claims to be a demonstration turns out to be a mere specious attempt to persuade the reader that the inexplicable has been explained; that the fortunate guesses of an inspired investigator are examples of genuine reasoning. A typical instance of this kind of anti-climax occurs in Poe’s “Murders in the Rue Morgue” when Dupin follows the unspoken thoughts of his companion and joins in at the appropriate moment. The reader is astonished and marvels how such an apparently impossible feat could have been performed. Then Dupin explains; but his explanation is totally unconvincing, and the impossibility remains. The reader has had his astonishment for nothing. It cannot be too much emphasized that to the critical reader the quality in a detective story which takes precedence of all others is conclusiveness. It is the quality which, above all others, yields that intellectual satisfaction that the reader seeks; and it is the quality which is the most difficult to attain, and which costs more than any other in care and labour to the author.
MEET DR JOHN EVELYN THORNDYKE
A FASCINATING INSIGHT INTO THE CHARACTER WRITTEN BY THE AUTHOR

MY subject is Dr. John Thorndyke, the hero or central character of most of my detective stories. So I'll give you a short account of his real origin; of the way in which he did in fact come into existence.

To discover the origin of John Thorndyke I have to reach back into the past for at least fifty years, to the time when I was a medical student preparing for my final examination. For reasons which I need not go into I gave rather special attention to the legal aspects of medicine and the medical aspects of law. And as I read my text-books, and especially the illustrative cases, I was profoundly impressed by their dramatic quality. Medical jurisprudence deals with the human body in its relation to all kinds of legal problems. Thus its subject matter includes all sorts of crime against the person and all sorts of violent death and bodily injury: hanging, drowning, poisons and their effects, problems of suicide and homicide, of personal identity and survivorship, and a host of other problems of the highest dramatic possibilities, though not always quite presentable for the purposes of fiction. And the reported cases which were given in illustration were often crime stories of the most thrilling interest. Cases of disputed identity such as the Tichbourne Case, famous poisoning cases such
as the Rugeley Case and that of Madeline Smith, cases of mysterious disappearance or the detection of long-forgotten crimes such as that of Eugene Aram; all these, described and analysed with strict scientific accuracy, formed the matter of Medical Jurisprudence which thrilled me as I read and made an indelible impression.

But it produced no immediate results. I had to pass my examinations and get my diploma, and then look out for the means of earning my living. So all this curious lore was put away for the time being in the pigeon-holes of my mind—which Dr. Freud would call the Unconscious—not forgotten, but ready to come to the surface when the need for it should arise. And there it reposed for some twenty years, until failing health compelled me to abandon medical practice and take to literature as a profession.

It was then that my old studies recurred to my mind. A fellow doctor, Conan Doyle, had made a brilliant and well-deserved success by the creation of the immortal Sherlock Holmes. Considering that achievement, I asked myself whether it might not be possible to devise a detective story of a slightly different kind; one based on the science of Medical Jurisprudence, in which, by the sacrifice of a certain amount of dramatic effect, one could keep entirely within the facts of real life, with nothing fictitious excepting the persons and the events. I came to the conclusion that it was, and began to turn the idea over in my mind.

But I think that the influence which finally determined the character of my detective stories, and incidentally the character of John Thorndyke, operated when I was working at the Westminster Ophthalmic Hospital. There I used to take the patients into the dark room, examine their eyes with the ophthalmoscope, estimate the errors of refraction, and construct an experimental pair of spectacles to correct those errors. When a perfect correction had been arrived at, the formula for it was embodied in a prescription which was sent to the optician who made the permanent spectacles.

Now when I was writing those prescriptions it was borne in on me that in many cases, especially the more complex, the formula for the spectacles, and consequently the spectacles themselves, furnished an infallible record of personal identity. If, for instance, such a pair of spectacles should have been found in a railway carriage, and the maker of those spectacles could be found, there would be practically conclusive evidence that a particular person had travelled by that train. About that time I drafted out a story based on a pair of spectacles, which was published some years later under the title of The Mystery of 31 New Inn, and the construction of that story determined, as I have said, not only the general character of my future work but of the hero around whom the plots were to be woven. But that story remained for some years in cold storage. My first published detective novel was The Red Thumb-mark, and in that book we may consider that John Thorndyke was born. And in passing on to describe him I may as well explain how and why he came to be the kind of person that he is.

I may begin by saying that he was not modelled after any real person. He was deliberately created to play a certain part, and the idea that was in my mind was that he should be such a person as would be likely and suitable to occupy such a position in real life. As he was to be a medico-legal expert, he had to be a doctor and a fully trained lawyer. On the physical side I endowed him with every kind of natural advantage. He is exceptionally tall, strong, and athletic because those qualities are useful in his vocation. For the same reason he has acute eyesight and hearing and considerable general manual skill, as every doctor ought to have. In appearance he is handsome and of an imposing presence, with a symmetrical face of the classical type and a Grecian nose. And here I may remark that his distinguished appearance is not merely a concession to my personal taste but is also a protest against the monsters of ugliness whom some detective writers have evolved.

These are quite opposed to natural truth. In real life a first-class man of any kind usually tends to be a good-looking man.

Mentally, Thorndyke is quite normal. He has no gifts of intuition or other supernormal mental qualities. He is a highly intellectual man of great and varied knowledge with exceptionally acute reasoning powers and endowed with that invaluable asset, a scientific imagination (by a scientific imagination I mean that special faculty which marks the born investigator; the capacity to perceive the essential nature of a problem before the detailed evidence comes into sight). But he arrives at his conclusions by ordinary reasoning, which the reader can follow when he has been supplied with the facts; though the intricacy of the train of reasoning may at times call for an exposition at the end of the investigation.

Thorndyke has no eccentricities or oddities which might detract from the dignity of an eminent professional man, unless one excepts an unnatural liking for Trichinopoly cheroots. In manner he is quiet, reserved and self-contained, and rather markedly secretive, but of a kindly nature, though not sentimental, and addicted to occasional touches of dry humour. That is how Thorndyke appears to me.

As to his age. When he made his first bow to the reading public from the doorway of Number 4 King’s Bench Walk he was between thirty-five and forty. As that was thirty years ago, he should now be over sixty-five. But he isn’t. If I have to let him “grow old along with me” I need not saddle him with the infirmities of age, and I can (in his case) put the brake on the passing years. Probably he is not more than fifty after all!

Now a few words as to how Thorndyke goes to work. His methods are rather different from those of the detectives of the Sherlock Holmes school. They are more technical and more specialized. He is an investigator of crime but he is not a detective. The technique of Scotland Yard would be neither suitable nor possible to him. He is a medico-legal expert, and his methods are those of medico-legal science. In the investigation of a crime there are two entirely different methods of approach. One consists in the careful and laborious examination of a vast mass of small and commonplace detail: inquiring into the movements of suspected and other persons; interrogating witnesses and checking their statements particularly as to times and places; tracing missing persons, and so forth—the aim being to accumulate a great body of circumstantial
evidence which will ultimately disclose the solution of the problem. It is an admirable method, as the success of our police proves, and it is used with brilliant effect by at least one of our contemporary detective writers. But it is essentially a police method.

The other method consists in the search for some fact of high evidential value which can be demonstrated by physical methods and which constitutes conclusive proof of some important point. This method also is used by the police in suitable cases. Finger-prints are examples of this kind of evidence, and another instance is furnished by the Gutteridge murder. Here the microscopical examination of a cartridge-case proved conclusively that the murder had been committed with a particular revolver; a fact which incriminated the owner of that revolver and led to his conviction.

This is Thorndyke's procedure. It consists in the interrogation of things rather than persons; of the ascertainment of physical facts which can be made visible to eyes other than his own. And the facts which he seeks tend to be those which are apparent only to the trained eye of the medical practitioner.

I feel that I ought to say a few words about Thorndyke's two satellites, Jervis and Polton. As to the former, he is just the traditional narrator proper to this type of story. Some of my readers have complained that Dr. Jervis is rather slow in the uptake. But that is precisely his function. He is the expert misunderstander. His job is to observe and record all the facts, and to fail completely to perceive their significance. Thereby he gives the reader all the necessary information, and he affords Thorndyke the opportunity to expound its bearing on the case.

Polton is in a slightly different category. Although he is not drawn from any real person, he is associated in my mind with two actual individuals. One is a Mr. Pollard, who was the laboratory assistant in the hospital museum when I was a student, and who gave me many a valuable tip in matters of technique, and who, I hope, is still to the good. The other was a watch- and clock-maker of the name of Parsons —familiarly known as Uncle Parsons—who had premises in a basement near the Royal Exchange, and who was a man of boundless ingenuity and technical resource. Both of these I regard as collateral relatives, so to speak, of Nathaniel Polton. But his personality is not like either. His crinkly countenance is strictly his own copyright.

To return to Thorndyke, his rather technical methods have, for the purposes of fiction, advantages and disadvantages. The advantage is that his facts are demonstrably true, and often they are intrinsically interesting. The disadvantage is that they are frequently not matters of common knowledge, so that the reader may fail to recognize them or grasp their significance until they are explained. But this is the case with all classes of fiction. There is no type of character or story that can be made sympathetic and acceptable to every kind of reader. The personal equation affects the reading as well as the writing of a story.
THE RED THUMB MARK

I. — MY LEARNED BROTHER

"CONFAGRATAM An° 1677. Fabricatam An° 1698. Richardo Powell Armiger Thesaurar." The words, set in four panels, which formed a frieze beneath the pediment of a fine brick portico, summarised the history of one of the tall houses at the upper end of King's Bench Walk and as I, somewhat absentmindedly, read over the inscription, my attention was divided between admiration of the exquisitely finished carved brickwork and the quiet dignity of the building, and an effort to reconstitute the dead and gone Richard Powell, and the stirring times in which he played his part.

I was about to turn away when the empty frame of the portico became occupied by a figure, and one so appropriate, in its wig and obsolete habiliments, to the old-world surroundings that it seemed to complete the picture, and I lingered idly to look at it. The barrister had halted in the doorway to turn over a sheaf of papers that he held in his hand, and, as he replaced the red tape which bound them together, he looked up and our eyes met. For a moment we regarded one another with the inquisitive gaze that casual strangers bestow on one another; then there was a flash of mutual recognition; the impassive and rather severe face of the lawyer softened into a genial smile, and the figure, detaching itself from its frame, came down the steps with a hand extended in cordial greeting.

"My dear Jervis," he exclaimed, as we clasped hands warmly, "this is a great and delightful surprise. How often have I thought of my old comrade and wondered if I should ever see him again, and lo! here he is, thrown up on the sounding beach of the Inner Temple, like the proverbial bread cast upon the waters."

"Your surprise, Thorndyke, is nothing to mine," I replied, "for your bread has at least returned as bread; whereas I am in the position of a man who, having cast his bread upon the waters, sees it return in the form of a buttered muffin or a Bath bun. I left a respectable medical practitioner and I find him transformed into a bewigged and begowned limb of the law."

Thorndyke laughed at the comparison.

"Liken not your old friend unto a Bath bun," said he. "Say, rather, that you left him a chrysalis and come back to find him a butterfly. But the change is not so great as you think. Hippocrates is only hiding under the gown of Solon, as you will understand when I explain my metamorphosis; and that I will do this very evening, if you have no engagement."

"I am one of the unemployed at present," I said, "and quite at your service."

"Then come round to my chambers at seven," said Thorndyke, "and we will have a chop and a pint of claret together and exchange autobiographies. I am due in court in a few minutes."

"Do you reside within that noble old portico?" I asked.

"No," replied Thorndyke. "I often wish I did. It would add several inches to one's stature to feel that the mouth of one's burrow was graced with a Latin inscription for admiring strangers to ponder over. No; my chambers are some doors further down—number 6A"—and he turned to point out the house as we crossed towards Crown Office Row.

At the top of Middle Temple Lane we parted, Thorndyke taking his way with fluttering gown towards the Law Courts, while I directed my steps westward towards Adam Street, the chosen haunt of the medical agent.

The soft-voiced bell of the Temple clock was telling out the hour of seven in muffled accents (as though it apologised for breaking the studious silence) as I emerged from the archway of Mitre Court and turned into King's Bench Walk.

The paved footway was empty save for a single figure, pacing slowly before the doorway of number 6A, in which, though the wig had now given place to a felt hat and the gown to a jacket, I had no difficulty in recognising my friend.

"Punctual to the moment, as of old," said he, meeting me half-way. "What a blessed virtue is punctuality, even in small things. I have just been taking the air in Fountain Court, and will now introduce you to my chambers. Here is my humble retreat."

We passed in through the common entrance and ascended the stone stairs to the first floor, where we were confronted by a massive door, above which my friend's name was written in white letters.

"Rather a forbidding exterior," remarked Thorndyke, as he inserted the latchkey, "but it is homely enough inside."

The heavy door swung outwards and disclosed a baize-covered inner door, which Thorndyke pushed open and held for me to pass in.

"You will find my chambers an odd mixture," said Thorndyke, "for they combine the attractions of an office, a museum, a laboratory and a workshop."

"And a restaurant," added a small, elderly man, who was decanting a bottle of claret by means of a glass syphon: "you forgot that, sir."

"Yes, I forgot that, Polton," said Thorndyke, "but I see you have not." He glanced towards a small table that had been placed near the fire and set out with the requisites for our meal.
“Tell me,” said Thorndyke, as we made the initial onslaught on the products of Polton’s culinary experiments, “what has been happening to you since you left the hospital six years ago?”

“My story is soon told,” I answered, somewhat bitterly. “It is not an uncommon one. My funds ran out, as you know, rather unexpectedly. When I had paid my examination and registration fees the coffer was absolutely empty, and though, no doubt, a medical diploma contains—to use Johnson’s phrase—the potentiality of wealth beyond the dreams of avarice, there is a vast difference in practice between the potential and the actual. I have, in fact, been earning a subsistence, sometimes as an assistant, sometimes as a locum tenens. Just now I’ve got no work to do, and so have entered my name on Turcival’s list of eligibles.”

Thorndyke pursed up his lips and frowned.

“It’s a wicked shame, Jervis,” said he presently, “that a man of your abilities and scientific acquirements should be frittering away his time on odd jobs like some half-qualified wastrel.”

“It is,” I agreed. “My merits are grossly undervalued by a stiff-necked and obtuse generation. But what would you have, my learned brother? If poverty steps behind you and claps the occulting bushel over your thirty thousand candle-power luminary, your brilliancy is apt to be obscured.”

“Yes, I suppose that is so,” grunted Thorndyke, and he remained for a time in deep thought.

“And now,” said I, “let us have your promised explanation. I am positively frizzling with curiosity to know what chain of circumstances has converted John Evelyn Thorndyke from a medical practitioner into a luminary of the law.”

Thorndyke smiled indulgently.

“The fact is,” said he, “that no such transformation has occurred. John Evelyn Thorndyke is still a medical practitioner.”

“What, in a wig and gown!” I exclaimed.

“Yes, a mere sheep in wolf’s clothing,” he replied. “I will tell you how it has come about. After you left the hospital, six years ago, I stayed on, taking up any small appointments that were going—assistant demonstrator—or curatorships and such like—hung about the chemical and physical laboratories, the museum and post mortem room, and meanwhile took my M.D. and D.Sc. Then I got called to the bar in the hope of getting a coronership, but soon after this, old Stedman retired unexpectedly—you remember Stedman, the lecturer on medical jurisprudence—and I put in for the vacant post. Rather to my surprise, I was appointed lecturer, whereupon I dismissed the coronership from my mind, took my present chambers and sat down to wait for anything that might come.”

“And what has come?” I asked.

“Why, a very curious assortment of miscellaneous practice,” he replied. “At first I only got an occasional analysis in a doubtful poisoning case, but, by degrees, my sphere of influence has extended until it now includes all cases in which a special knowledge of medicine or physical science can be brought to bear upon law.”

“But you plead in court, I observe,” said I.

“Very seldom,” he replied. “More usually I appear in the character of that bête noir of judges and counsel—the scientific witness. But in most instances I do not appear at all; I merely direct investigations, arrange and analyse the results, and prime the counsel with facts and suggestions for cross-examination.”

“A good deal more interesting than acting as understudy for an absent g.p.,” said I, a little enviously. “But you deserve to succeed, for you were always a deuce of a worker, to say nothing of your capabilities.”

“Yes, I worked hard,” replied Thorndyke, “and I work hard still; but I have my hours of labour and my hours of leisure, unlike you poor devils of general practitioners, who are liable to be dragged away from the dinner table or roused out of your first sleep by—confound it all! who can that be?”

For at this moment, as a sort of commentary on his self-congratulation, there came a smart rapping at the outer door.

“Must see who it is, I suppose,” he continued, “though one expects people to accept the hint of a closed oak.”

He strode across the room and flung open the door with an air of by no means gracious inquiry.

“It’s rather late for a business call,” said an apologetic voice outside, “but my client was anxious to see you without delay.”

“Come in, Mr. Lawley,” said Thorndyke, rather stiffly, and, as he held the door open, the two visitors entered. They were both men—one middle-aged, rather foxy in appearance and of a typically legal aspect, and the other a fine, handsome young fellow of very prepossessing exterior, though at present rather pale and wild-looking, and evidently in a state of profound agitation.

“I am afraid,” said the latter, with a glance at me and the dinner table, “that our visit—for which I am alone responsible—is a most unseasonable one. If we are really inconveniencing you, Dr. Thorndyke, pray tell us, and my business must wait.”

Thorndyke had cast a keen and curious glance at the young man, and he now replied in a much more genial tone—

“I take it that your business is of a kind that will not wait, and as to inconveniencing us, why, my friend and I are both doctors, and, as you are aware, no doctor expects to call any part of the twenty-four hours his own unreservedly.”
I had risen on the entrance of the two strangers, and now proposed to take a walk on the Embankment and return later, but the young man interrupted me.

"Pray don't go away on my account," he said. "The facts that I am about to lay before Dr. Thorndyke will be known to all the world by this time to-morrow, so there is no occasion for any show of secrecy."

"In that case," said Thorndyke, "let us draw our chairs up to the fire and fall to business forthwith. We had just finished our dinner and were waiting for the coffee, which I hear my man bringing down at this moment."

We accordingly drew up our chairs, and when Polton had set the coffee on the table and retired, the lawyer plunged into the matter without preamble.

---

II. — THE SUSPECT

"I HAD better," said he, "give you a general outline of the case as it presents itself to the legal mind, and then my client, Mr. Reuben Hornby, can fill in the details if necessary, and answer any questions that you may wish to put to him."

"Mr. Reuben occupies a position of trust in the business of his uncle, John Hornby, who is a gold and silver refiner and dealer in precious metals generally. There is a certain amount of outside assay work carried on in the establishment, but the main business consists in the testing and refining of samples of gold sent from certain mines in South Africa."

"About five years ago Mr. Reuben and his cousin Walter—another nephew of John Hornby—left school, and both were articled to their uncle, with the view to their ultimately becoming partners in the house; and they have remained with him ever since, occupying, as I have said, positions of considerable responsibility."

"And now for a few words as to how business is conducted in Mr. Hornby's establishment. The samples of gold are handed over at the docks to some accredited representative of the firm—generally either Mr. Reuben or Mr. Walter—who has been despatched to meet the ship, and conveyed either to the bank or to the works according to circumstances. Of course every effort is made to have as little gold as possible on the premises, and the bars are always removed to the bank at the earliest opportunity; but it happens unavoidably that samples of considerable value have often to remain on the premises all night, and so the works are furnished with a large and powerful safe or strong room for their reception. This safe is situated in the private office under the eye of the principal, and, as an additional precaution, the caretaker, who acts as night-watchman, occupies a room directly over the office, and patrols the building periodically through the night."

"Now a very strange thing has occurred with regard to this safe. It happens that one of Mr. Hornby's customers in South Africa is interested in a diamond mine, and, although transactions in precious stones form no part of the business of the house, he has, from time to time, sent parcels of rough diamonds addressed to Mr. Hornby, to be either deposited in the bank or handed on to the diamond brokers."

"A fortnight ago Mr. Hornby was advised that a parcel of stones had been despatched by the Elmina Castle, and it appeared that the parcel was an unusually large one and contained stones of exceptional size and value. Under these circumstances Mr. Reuben was sent down to the docks at an early hour in the hope the ship might arrive in time for the stones to be lodged in the bank at once. Unfortunately, however, this was not the case, and the diamonds had to be taken to the works and locked up in the safe."

"Who placed them in the safe?" asked Thorndyke.

"Mr. Hornby himself, to whom Mr. Reuben delivered up the package on his return from the docks."

"Yes," said Thorndyke, "and what happened next?"

"Well, on the following morning, when the safe was opened, the diamonds had disappeared."

"Had the place been broken into?" asked Thorndyke.

"No. The place was all locked up as usual, and the caretaker, who had made his accustomed rounds, had heard nothing, and the safe was, outwardly, quite undisturbed. It had evidently been opened with keys and locked again after the stones were removed."

"And in whose custody were the keys of the safe?" inquired Thorndyke.

"Mr. Hornby usually kept the keys himself, but, on occasions, when he was absent from the office, he handed them over to one of his nephews—whichever happened to be in charge at the time. But on this occasion the keys did not go out of his custody from the time when he locked up the safe, after depositing the diamonds in it, to the time when it was opened by him on the following morning."

"And was there anything that tended to throw suspicion upon anyone?" asked Thorndyke.

"Why, yes," said Mr. Lawley, with an uncomfortable glance at his client, "unfortunately there was. It seemed that the person who abstracted the diamonds must have cut or scratched his thumb or finger in some way, for there were two drops of blood on the bottom of the safe and one or two bloody smears on a piece of paper, and, in addition, a remarkably clear imprint of a thumb."

"Also in blood?" asked Thorndyke.
“Yes. The thumb had apparently been put down on one of the drops and then, while still wet with blood, had been pressed on the paper in taking hold of it or otherwise.”

“Well, and what next?”

“Well,” said the lawyer, fidgeting in his chair, “to make a long story short, the thumb-print has been identified as that of Mr. Reuben Hornby.”

“Ha!” exclaimed Thorndyke. “The plot thickens with a vengeance. I had better jot down a few notes before you proceed any further.”

He took from a drawer a small paper-covered notebook, on the cover of which he wrote “Reuben Hornby,” and then, laying the book open on a blotting-pad, which he rested on his knee, he made a few brief notes.

“Now,” he said, when he had finished, “with reference to this thumb-print. There is no doubt, I suppose, as to the identification?”

“None whatever,” replied Mr. Lawley. “The Scotland Yard people, of course, took possession of the paper, which was handed to the director of the finger-print department for examination and comparison with those in their collection. The report of the experts is that the thumb-print does not agree with any of the thumb-prints of criminals in their possession; that it is a very peculiar one, inasmuch as the ridge-pattern on the bulb of the thumb—which is a remarkably distinct and characteristic one—is crossed by the scar of a deep cut, rendering identification easy and infallible; that it agrees in every respect with the thumb-print of Mr. Reuben Hornby, and is, in fact, his thumb-print beyond any possible doubt.”

“Is there any possibility,” asked Thorndyke, “that the paper bearing the thumb-print could have been introduced by any person?”

“No,” answered the lawyer. “It is quite impossible. The paper on which the mark was found was a leaf from Mr. Hornby’s memorandum block. He had pencilled on it some particulars relating to the diamonds, and laid it on the parcel before he closed up the safe.”

“Was anyone present when Mr. Hornby opened the safe in the morning?” asked Thorndyke.

“No, he was alone,” answered the lawyer. “He saw at a glance that the diamonds were missing, and then he observed the paper with the thumb-mark on it, on which he closed and locked the safe and sent for the police.”

“Is it not rather odd that the thief did not notice the thumb-mark, since it was so distinct and conspicuous?”

“No, I think not,” answered Mr. Lawley. “The paper was lying face downwards on the bottom of the safe, and it was only when he picked it up and turned it over that Mr. Hornby discovered the thumb-print. Apparently the thief had taken hold of the parcel, with the paper on it, and the paper had afterwards dropped off and fallen with the marked surface downwards—probably when the parcel was transferred to the other hand.”

“You mentioned,” said Thorndyke, “that the experts at Scotland Yard have identified this thumb-mark as that of Mr. Reuben Hornby. May I ask how they came to have the opportunity of making the comparison?”

“Aha!” said Mr. Lawley. “Thereby hangs a very curious tale of coincidences. The police, of course, when they found that there was so simple a means of identification as a thumb-mark, wished to take thumb-prints of all the employees in the works; but this Mr. Hornby refused to sanction—rather quixotically, as it seems to me—saying that he would not allow his nephews to be subjected to such an indignity. Now it was, naturally, these nephews in whom the police were chiefly interested, seeing that they alone had had the handling of the keys, and considerable pressure was brought to bear upon Mr. Hornby to have the thumb-prints taken.

“However, he was obdurate, scouting the idea of any suspicion attaching to either of the gentlemen in whom he had reposed such complete confidence and whom he had known all their lives, and so the matter would probably have remained a mystery but for a very odd circumstance.

“You may have seen on the bookstalls and in shop windows an appliance called a ‘Thumbograph,’ or some such name, consisting of a small book of blank paper for collecting the thumb-prints of one’s friends, together with an inking pad.”

“I have seen those devices of the Evil One,” said Thorndyke, “in fact, I have one, which I bought at Charing Cross Station.”

“Well, it seems that some months ago Mrs. Hornby, the wife of John Hornby, purchased one of these toys—”

“As a matter of fact,” interrupted Reuben, “it was my cousin Walter who bought the thing and gave it to her.”

“Well, that is not material,” said Mr. Lawley (though I observed that Thorndyke made a note of the fact in his book); “at any rate, Mrs. Hornby became possessed of one of these appliances and proceeded to fill it with the thumb-prints of her friends, including her two nephews. Now it happened that the detective in charge of this case called yesterday at Mr. Hornby’s house when the latter was absent from home, and took the opportunity of urging her to induce her husband to consent to have the thumb-prints of her nephews taken for the inspection of the experts at Scotland Yard. He pointed out that the procedure was really necessary, not only in the interests of justice but in the interests of the young men themselves, who were regarded with considerable suspicion by the police, which suspicion would be completely removed if it could be shown by actual comparison that the thumb-print could not have been made by either of them. Moreover, it
seemed that both the young men had expressed their willingness to have the test applied, but had been forbidden by their uncle. Then Mrs. Hornby had a brilliant idea. She suddenly remembered the 'Thumbograph,' and thinking to set the question at rest once for all, fetched the little book and showed it to the detective. It contained the prints of both thumbs of Mr. Reuben (among others), and, as the detective had with him a photograph of the incriminating mark, the comparison was made then and there; and you may imagine Mrs. Hornby's horror and amazement when it was made clear that the print of her nephew Reuben's left thumb corresponded in every particular with the thumb-print that was found in the safe.

"At this juncture Mr. Hornby arrived on the scene and was, of course, overwhelmed with consternation at the turn events had taken. He would have liked to let the matter drop and make good the loss of the diamonds out of his own funds, but, as that would have amounted practically to compounding a felony, he had no choice but to prosecute. As a result, a warrant was issued for the arrest of Mr. Reuben, and was executed this morning, and my client was taken forthwith to Bow Street and charged with the robbery."

"Was any evidence taken?" asked Thorndyke.

"No. Only evidence of arrest. The prisoner is remanded for a week, bail having been accepted in two sureties of five hundred pounds each."

Thorndyke was silent for a space after the conclusion of the narrative. Like me, he was evidently not agreeably impressed by the lawyer's manner, which seemed to take his client’s guilt for granted, a position indeed not entirely without excuse having regard to the circumstances of the case.

"What have you advised your client to do?" Thorndyke asked presently.

"I have recommended him to plead guilty and throw himself on the clemency of the court as a first offender. You must see for yourself that there is no defence possible."

The young man flushed crimson, but made no remark.

"But let us be clear how we stand," said Thorndyke. "Are we defending an innocent man or are we endeavouring to obtain a light sentence for a man who admits that he is guilty?"

Mr. Lawley shrugged his shoulders.

"That question can be best answered by our client himself," said he. Thorndyke directed an inquiring glance at Reuben Hornby, remarking—

"You are not called upon to incriminate yourself in any way, Mr. Hornby, but I must know what position you intend to adopt."

Here I again proposed to withdraw, but Reuben interrupted me.

"There is no need for you to go away, Dr. Jervis," he said. "My position is that I did not commit this robbery and that I know nothing whatever about it or about the thumb-print that was found in the safe. I do not, of course, expect you to believe me in the face of the overwhelming evidence against me, but I do, nevertheless, declare in the most solemn manner before God, that I am absolutely innocent of this crime and have no knowledge of it whatever."

"Then I take it that you did not plead 'guilty'?" said Thorndyke.

"Certainly not; and I never will," replied Reuben hotly.

"You would not be the first innocent man, by very many, who has entered that plea," remarked Mr. Lawley. "It is often the best policy, when the defence is hopelessly weak."

"It is a policy that will not be adopted by me," rejoined Reuben. "I may be, and probably shall be, convicted and sentenced, but I shall continue to maintain my innocence, whatever happens. Do you think," he added, turning to Thorndyke, "that you can undertake my defence on that assumption?"

"It is the only assumption on which I should agree to undertake the case," replied Thorndyke.

"And—if I may ask the question—" pursued Reuben anxiously, "do you find it possible to conceive that I may really be innocent?"

"Certainly I do," Thorndyke replied, on which I observed Mr. Lawley’s eyebrows rise perceptibly. "I am a man of facts, not an advocate, and if I found it impossible to entertain the hypothesis of your innocence, I should not be willing to expend time and energy in searching for evidence to prove it. Nevertheless," he continued, seeing the light of hope break out on the face of the unfortunate young man, "I must impress upon you that the case presents enormous difficulties and that we must be prepared to find them insuperable in spite of all our efforts."

"I expect nothing but a conviction," replied Reuben in a calm and resolute voice, "and can face it like a man if only you do not take my guilt for granted, but give me a chance, no matter how small, of making a defence."

"Everything shall be done that I am capable of doing," said Thorndyke; "that I can promise you. The long odds against us are themselves a spur to endeavour, as far as I am concerned. And now, let me ask you, have you any cuts or scratches on your fingers?"

Reuben Hornby held out both his hands for my colleague's inspection, and I noticed that they were powerful and
shapely, like the hands of a skilled craftsman, though faultlessly kept. Thorndyke set on the table a large condenser such as is used for microscopic work, and taking his client's hand, brought the bright spot of light to bear on each finger in succession, examining their tips and the parts around the nails with the aid of a pocket lens.

“A fine, capable hand, this,” said he, regarding the member approvingly, as he finished his examination, “but I don't perceive any trace of a scar on either the right or left. Will you go over them, Jervis? The robbery took place a fortnight ago, so there has been time for a small cut or scratch to heal and disappear entirely. Still, the matter is worth noting.”

He handed me the lens and I scrutinised every part of each hand without being able to detect the faintest trace of any recent wound.

“There is one other matter that must be attended to before you go,” said Thorndyke, pressing the electric bell-push by his chair. “I will take one or two prints of the left thumb for my own information.”

In response to the summons, Polton made his appearance from some lair unknown to me, but presumably the laboratory, and, having received his instructions, retired, and presently returned carrying a box, which he laid on the table. From this receptacle Thorndyke drew forth a bright copper plate mounted on a slab of hard wood, a small printer's roller, a tube of finger-print ink, and a number of cards with very white and rather glazed surfaces.

“Now, Mr. Hornby,” said he, “your hands, I see, are beyond criticism as to cleanliness, but we will, nevertheless, give the thumb a final polish.”

Accordingly he proceeded to brush the bulb of the thumb with a well-soaked badger-hair nail-brush, and, having rinsed it in water, dried it with a silk handkerchief, and gave it a final rub on a piece of chamois leather. The thumb having been thus prepared, he squeezed out a drop of the thick ink on to the copper plate and spread it out with the roller, testing the condition of the film from time to time by touching the plate with the tip of his finger and taking an impression on one of the cards.

When the ink had been rolled out to the requisite thinness, he took Reuben's hand and pressed the thumb lightly but firmly on to the inked plate; then, transferring the thumb to one of the cards, which he directed me to hold steady on the table, he repeated the pressure, when there was left on the card a beautifully sharp and clear impression of the bulb of the thumb, the tiny papillary ridges being shown with microscopic distinctness, and even the mouths of the sweat glands, which appeared as rows of little white dots on the black lines of the ridges. This manoeuvre was repeated a dozen times on two of the cards, each of which thus received six impressions. Thorndyke then took one or two rolled prints, i.e. prints produced by rolling the thumb first on the inked slab and then on the card, by which means a much larger portion of the surface of the thumb was displayed in a single print.

“And now,” said Thorndyke, “that we may be furnished with all the necessary means of comparison, we will take an impression in blood.”

The thumb was accordingly cleansed and dried afresh, when Thorndyke, having pricked his own thumb with a needle, squeezed out a good-sized drop of blood on to a card.

“There,” said he, with a smile, as he spread the drop out with the needle into a little shallow pool, “it is not every lawyer who is willing to shed his blood in the interests of his client.”

He proceeded to make a dozen prints as before on two cards, writing a number with his pencil opposite each print as he made it.

“We are now,” said he, as he finally cleansed his client's thumb, “furnished with the material for a preliminary investigation, and if you will now give me your address, Mr. Hornby, we may consider our business concluded for the present. I must apologise to you, Mr. Lawley, for having detained you so long with these experiments.”

The lawyer had, in fact, been viewing the proceedings with hardly concealed impatience, and he now rose with evident relief that they were at an end.

“I have been highly interested,” he said mendaciously, “though I confess I do not quite fathom your intentions. And, by the way, I should like to have a few words with you on another matter, if Mr. Reuben would not mind waiting for me in the square just a few minutes.”

“Not at all,” said Reuben, who was, I perceived, in no way deceived by the lawyer's pretence. “Don't hurry on my account; my time is my own—at present.” He held out his hand to Thorndyke, who grasped it cordially.

“Good-bye, Mr. Hornby,” said the latter. “Do not be unnecessarily sanguine, but at the same time, do not lose heart. Keep your wits about you and let me know at once if anything occurs to you that may have a bearing on the case.”

The young man then took his leave, and, as the door closed after him, Mr. Lawley turned towards Thorndyke.

“I thought I had better have a word with you alone,” he said, “just to hear what line you propose to take up, for I confess that your attitude has puzzled me completely.”

“What line would you propose?” asked Thorndyke.

“Well,” said the lawyer, with a shrug of his shoulders, “the position seems to be this: our young friend has stolen a parcel of diamonds and has been found out; at least, that is how the matter presents itself to me.”
“That is not how it presents itself to me,” said Thorndyke dryly. “He may have taken the diamonds or he may not. I have no means of judging until I have sifted the evidence and acquired a few more facts. This I hope to do in the course of the next day or two, and I suggest that we postpone the consideration of our plan of campaign until I have seen what line of defence it is possible to adopt.”

“As you will,” replied the lawyer, taking up his hat, “but I am afraid you are encouraging the young rogue to entertain hopes that will only make his fall the harder—to say nothing of our own position. We don’t want to make ourselves ridiculous in court, you know.”

“I don’t, certainly,” agreed Thorndyke. “However, I will look into the matter and communicate with you in the course of a day or two.”

He stood holding the door open as the lawyer descended the stairs, and when the footsteps at length died away, he closed it sharply and turned to me with an air of annoyance.

“The young rogue,” he remarked, “does not appear to me to have been very happy in his choice of a solicitor. By the way, Jervis, I understand you are out of employment just now?”

“That is so,” I answered.

“Would you care to help me—as a matter of business, of course—to work up this case? I have a lot of other work on hand and your assistance would be of great value to me.”

I said, with great truth, that I should be delighted.

“Then,” said Thorndyke, “come round to breakfast to-morrow and we will settle the terms, and you can commence your duties at once. And now let us light our pipes and finish our yarns as though agitated clients and thick-headed solicitors had no existence.”

III. — A LADY IN THE CASE

WHEN I arrived at Thorndyke’s chambers on the following morning, I found my friend already hard at work. Breakfast was laid at one end of the table, while at the other stood a microscope of the pattern used for examining plate-cultures of micro-organisms, on the wide stage of which was one of the cards bearing six thumb-prints in blood. A condenser threw a bright spot of light on the card, which Thorndyke had been examining when I knocked, as I gathered from the position of the chair, which he now pushed back against the wall.

“I see you have commenced work on our problem,” I remarked as, in response to a double ring of the electric bell, Polton entered with the materials for our repast.

“Yes,” answered Thorndyke. “I have opened the campaign, supported, as usual, by my trusty chief-of-staff; eh! Polton?”

The little man, whose intellectual, refined countenance and dignified bearing seemed oddly out of character with the teatray that he carried, smiled proudly, and, with a glance of affectionate admiration at my friend, replied—

“Yes, sir. We haven’t been letting the grass grow under our feet. There’s a beautiful negative washing upstairs and a bromide enlargement, which will be mounted and dried by the time you have finished your breakfast.”

“A wonderful man that, Jervis,” my friend observed as his assistant retired. “Looks like a rural dean or a chancery judge, and was obviously intended by Nature to be a professor of physics. As an actual fact he was first a watchmaker, then a maker of optical instruments, and now he is mechanical factotum to a medical jurist. He is my right-hand, is Polton; takes an idea before you have time to utter it—but you will make his more intimate acquaintance by-and-by.”

“Where did you pick him up?” I asked.

“He was an in-patient at the hospital when I first met him, miserably ill and broken, a victim of poverty and undeserved misfortune. I gave him one or two little jobs, and when I found what class of man he was I took him permanently into my service. He is perfectly devoted to me, and his gratitude is as boundless as it is uncalled for.”

“What are the photographs he was referring to?” I asked.

“He is making an enlarged facsimile of one of the thumb-prints on bromide paper and a negative of the same size in case we want the print repeated.”

“You evidently have some expectation of being able to help poor Hornby,” said I, “though I cannot imagine how you propose to go to work. To me his case seems as hopeless a one as it is possible to conceive. One doesn’t like to condemn him, but yet his innocence seems almost unthinkable.”

“It does certainly look like a hopeless case,” Thorndyke agreed, “and I see no way out of it at present. But I make it a rule, in all cases, to proceed on the strictly classical lines of inductive inquiry—collect facts, make hypotheses, test them and seek for verification. And I always endeavour to keep a perfectly open mind.

“Now, in the present case, assuming, as we must, that the robbery has actually taken place, there are four conceivable hypotheses: (1) that the robbery was committed by Reuben Hornby; (2) that it was committed by Walter Hornby; (3) that it was committed by John Hornby, or (4) that it was committed by some other person or persons.
“The last hypothesis I propose to disregard for the present and confine myself to the examination of the other three.”

“You don’t think it possible that Mr. Hornby could have stolen the diamonds out of his own safe?” I exclaimed.

“I incline at present to no one theory of the matter,” replied Thorndyke. “I merely state the hypotheses. John Hornby had access to the diamonds, therefore it is possible that he stole them.”

“But surely he was responsible to the owners.”

“Not in the absence of gross negligence, which the owners would have difficulty in proving. You see, he was what is called a gratuitous bailee, and in such a case no responsibility for loss lies with the bailee unless there has been gross negligence.”

“But the thumb-mark, my dear fellow!” I exclaimed. “How can you possibly get over that?”

“I don’t know that I can,” answered Thorndyke calmly; “but I see you are taking the same view as the police, who persist in regarding a finger-print as a kind of magical touchstone, a final proof, beyond which inquiry need not go. Now, this is an entire mistake. A finger-print is merely a fact—a very important and significant one, I admit—but still a fact, which, like any other fact, requires to be weighed and measured with reference to its evidential value.”

“And what do you propose to do first?”

“I shall first satisfy myself that the suspected thumb-print is identical in character with that of Reuben Hornby—of which, however, I have very little doubt, for the finger-print experts may fairly be trusted in their own speciality.”

“And then?”

“I shall collect fresh facts, in which I look to you for assistance, and, if we have finished breakfast, I may as well induct you into your new duties.”

He rose and rang the bell, and then, fetching from the office four small, paper-covered notebooks, laid them before me on the table.

“One of these books,” said he, “we will devote to data concerning Reuben Hornby. You will find out anything you can—anything, mind, no matter how trivial or apparently irrelevant—in any way connected with him and enter it in this book.” He wrote on the cover “Reuben Hornby” and passed the book to me. “In this second book you will, in like manner, enter anything that you can learn about Walter Hornby, and, in the third book, data concerning John. As to the fourth book, you will keep that for stray facts connected with the case but not coming under either of the other headings. And now let us look at the product of Polton’s industry.”

He took from his assistant’s hand a photograph ten inches long by eight broad, done on glazed bromide paper and mounted flatly on stiff card. It showed a greatly magnified facsimile of one of the thumb-prints, in which all the minute details, such as the orifices of the sweat glands and trifling irregularities in the ridges, which, in the original, could be seen only with the aid of a lens, were plainly visible to the naked eye. Moreover, the entire print was covered by a network of fine black lines, by which it was divided into a multitude of small squares, each square being distinguished by a number.

“Excellent, Polton,” said Thorndyke approvingly; “a most admirable enlargement. You see, Jervis, we have photographed the thumb-print in contact with a numbered micrometer divided into square twelfths of an inch. The magnification is eight diameters, so that the squares are here each two-thirds of an inch in diameter. I have a number of these micrometers of different scales, and I find them invaluable in examining cheques, doubtful signatures and such like. I see you have packed up the camera and the microscope, Polton; have you put in the micrometer?”

“Yes, sir,” replied Polton, “and the six-inch objective and the low-power eye-piece. Everything is in the case; and I have put ‘special rapid’ plates into the dark-slides in case the light should be bad.”

“Then we will go forth and beard the Scotland Yard lions in their den,” said Thorndyke, putting on his hat and gloves.

“But surely,” said I, “you are not going to drag that great microscope to Scotland Yard, when you only want eight diameters. Haven’t you a dissecting microscope or some other portable instrument?”

“We have a most delightful instrument of the dissecting type, of Polton’s own make—he shall show it to you. But I may have need of a more powerful instrument—and here let me give you a word of warning: whatever you may see me do, make no comments before the officials. We are seeking information, not giving it, you understand.”

At this moment the little brass knocker on the inner door—the outer oak being open—uttered a timid and apologetic rata-tat.

“Who the deuce can that be?” muttered Thorndyke, replacing the microscope on the table. He strode across to the door and opened it somewhat brusquely, but immediately whisked his hat off, and I then perceived a lady standing on the threshold.

“Dr. Thorndyke?” she inquired, and as my colleague bowed, she continued, “I ought to have written to ask for an appointment but the matter is rather urgent—it concerns Mr. Reuben Hornby and I only learned from him this morning that he had consulted you.”

“Pray come in,” said Thorndyke. “Dr. Jervis and I were just setting out for Scotland Yard on this very business. Let me present you to my colleague, who is working up the case with me.”
Our visitor, a tall handsome girl of twenty or thereabouts, returned my bow and remarked with perfect self-possession, "My name is Gibson—Miss Juliet Gibson. My business is of a very simple character and need not detain you many minutes."

She seated herself in the chair that Thorndyke placed for her, and continued in a brisk and business-like manner—

"I must tell you who I am in order to explain my visit to you. For the last six years I have lived with Mr. and Mrs. Hornby, although I am no relation to them. I first came to the house as a sort of companion to Mrs. Hornby, though, as I was only fifteen at the time, I need hardly say that my duties were not very onerous; in fact, I think Mrs. Hornby took me because I was an orphan without the proper means of getting a livelihood, and she had no children of her own.

"Three years ago I came into a little fortune which rendered me independent; but I had been so happy with my kind friends that I asked to be allowed to remain with them, and there I have been ever since in the position of an adopted daughter. Naturally, I have seen a great deal of their nephews, who spend a good part of their time at the house, and I need not tell you that the horrible charge against Reuben has fallen upon us like a thunderbolt. Now, what I have come to say to you is this: I do not believe that Reuben stole those diamonds. It is entirely out of character with all my previous experience of him. I am convinced that he is innocent, and I am prepared to back my opinion."

"In what way?" asked Thorndyke.

"By supplying the sinews of war," replied Miss Gibson. "I understand that legal advice and assistance involves considerable expense."

"I am afraid you are quite correctly informed," said Thorndyke.

"Well, Reuben's pecuniary resources are, I am sure, quite small, so it is necessary for his friends to support him, and I want you to promise me that nothing shall be left undone that might help to prove his innocence if I make myself responsible for any costs that he is unable to meet. I should prefer, of course, not to appear in the matter, if it could be avoided."

"Your friendship is of an eminently practical kind, Miss Gibson," said my colleague, with a smile. "As a matter of fact, the costs are no affair of mine. If the occasion arose for the exercise of your generosity you would have to approach Mr. Reuben's solicitor through the medium of your guardian, Mr. Hornby, and with the consent of the accused. But I do not suppose the occasion will arise, although I am very glad you called, as you may be able to give us valuable assistance in other ways. For example, you might answer one or two apparently impertinent questions."

"I should not consider any question impertinent that you considered necessary to ask," our visitor replied.

"Then," said Thorndyke, "I will venture to inquire if any special relations exist between you and Mr. Reuben."

"You look for the inevitable motive in a woman," said Miss Gibson, laughing and flushing a little. "No, there have been no tender passages between Reuben and me. We are merely old and intimate friends; in fact, there is what I may call a tendency in another direction—Walter Hornby."

"Do you mean that you are engaged to Mr. Walter?"

"Oh, no," she replied; "but he has asked me to marry him—he has asked me, in fact, more than once; and I really believe that he has a sincere attachment to me."

She made this latter statement with an odd air, as though the thing asserted were curious and rather incredible, and the tone was evidently noticed by Thorndyke as well as me for he rejoined—

"Of course he has. Why not?"

"Well, you see," replied Miss Gibson, "I have some six hundred a year of my own and should not be considered a bad match for a young man like Walter, who has neither property nor expectations, and one naturally takes that into account. But still, as I have said, I believe he is quite sincere in his professions and not merely attracted by my money."

"I do not find your opinion at all incredible," said Thorndyke, with a smile, "even if Mr. Walter were quite a mercenary young man—which, I take it, he is not."

Miss Gibson flushed very prettily as she replied—

"Oh, pray do not trouble to pay me compliments; I assure you I am by no means insensible of my merits. But with regard to Walter Hornby, I should be sorry to apply the term 'mercenary' to him, and yet—well, I have never met a young man who showed a stronger appreciation of the value of money. He means to succeed in life and I have no doubt he will."

"And do I understand that you refused him?"

"Yes. My feelings towards him are quite friendly, but not of such a nature as to allow me to contemplate marrying him."

"And now, to return for a moment to Mr. Reuben. You have known him for some years?"

"I have known him intimately for six years," replied Miss Gibson.

"And what sort of character do you give him?"

"Speaking from my own observation of him," she replied, "I can say that I have never known him to tell an untruth or do
a dishonourable deed. As to theft, it is merely ridiculous. His habits have always been inexpensive and frugal, he is unambitious to a fault, and in respect to the 'main chance' his indifference is as conspicuous as Walter's keenness. He is a generous man, too, although careful and industrious.

"Thank you, Miss Gibson," said Thorndyke. "We shall apply to you for further information as the case progresses. I am sure that you will help us if you can, and that you can help us if you will, with your clear head and your admirable frankness. If you will leave us your card, Dr. Jervis and I will keep you informed of our prospects and ask for your assistance whenever we need it."

After our fair visitor had departed, Thorndyke stood for a minute or more gazing dreamily into the fire. Then, with a quick glance at his watch, he resumed his hat and, catching up the microscope, handed the camera case to me and made for the door.

"How the time goes!" he exclaimed, as we descended the stairs; "but it hasn't been wasted, Jervis, hey?"

"No, I suppose not," I answered tentatively.

"You suppose not!" he replied. "Why here is as pretty a little problem as you could desire—what would be called in the jargon of the novels, a psychological problem—and it is your business to work it out, too."

"You mean as to Miss Gibson's relations with these two young men?"

Thorndyke nodded.

"Is it any concern of ours?" I asked.

"Certainly it is," he replied. "Everything is a concern of ours at this preliminary stage. We are groping about for a clue and must let nothing pass unscrutinised."

"Well, then, to begin with, she is not wildly infatuated with Walter Hornby, I should say."

"No," agreed Thorndyke, laughing softly; "we may take it that the canny Walter has not inspired a grand passion."

"Then," I resumed, "if I were a suitor for Miss Gibson's hand, I think I would sooner stand in Reuben's shoes than in Walter's."

"There again I am with you," said Thorndyke. "Go on."

"Well," I continued, "our fair visitor conveyed to me the impression that her evident admiration of Reuben's character was tempered by something that she had heard from a third party. That expression of hers, 'speaking from my own observation,' seemed to imply that her observations of him were not in entire agreement with somebody else's."

"Good man!" exclaimed Thorndyke, slapping me on the back, to the undissembled surprise of a policeman whom we were passing; "that is what I had hoped for in you—the capacity to perceive the essential underneath the obvious. Yes; somebody has been saying something about our client, and the thing that we have to find out is, what is it that has been said and who has been saying it. We shall have to make a pretext for another interview with Miss Gibson."

"By the way, why didn't you ask her what she meant?" I asked foolishly.

Thorndyke grinned in my face. "Why didn't you?" he retorted.

"No," I rejoined, "I suppose it is not politic to appear too discerning. Let me carry the microscope for a time; it is making your arm ache, I see."

"Thanks," said he, handing the case to me and rubbing his fingers; "it is rather ponderous."

"I can't make out what you want with this great instrument," I said. "A common pocket lens would do all that you require. Besides, a six-inch objective will not magnify more than two or three diameters."

"Two, with the draw-tube closed," replied Thorndyke, "and the low-power eye-piece brings it up to four. Polton made them both for me for examining cheques, bank-notes and other large objects. But you will understand when you see me use the instrument, and remember, you are to make no comments."

We had by this time arrived at the entrance to Scotland Yard, and were passing up the narrow thoroughfare, when we encountered a uniformed official who halted and saluted my colleague.

"Ah, I thought we should see you here before long, doctor," said he genially. "I heard this morning that you have this thumb-print case in hand."

"Yes," replied Thorndyke; "I am going to see what can be done for the defence."

"Well," said the officer as he ushered us into the building, "you've given us a good many surprises, but you'll give us a bigger one if you can make anything of this. It's a foregone conclusion, I should say."

"My dear fellow," said Thorndyke, "there is no such thing. You mean that there is a prima facie case against the accused."

"Put it that way if you like," replied the officer, with a sly smile, "but I think you will find this about the hardest nut you ever tried your teeth on—and they're pretty strong teeth too, I'll say that. You had better come into Mr. Singleton's office," and he conducted us along a corridor and into a large, barely-furnished room, where we found a sedate-looking gentleman
seated at a large writing table.

"How-d'ye-do, doctor?" said the latter, rising and holding out his hand. "I can guess what you've come for. Want to see that thumb-print, eh?"

"Quite right," answered Thorndyke, and then, having introduced me, he continued: "We were partners in the last game, but we are on opposite sides of the board this time."

"Yes," agreed Mr. Singleton; "and we are going to give you check-mate."

He unlocked a drawer and drew forth a small portfolio, from which he extracted a piece of paper which he laid on the table. It appeared to be a sheet torn from a perforated memorandum block, and bore the pencilled inscription: "Handed in by Reuben at 7.3 p.m., 9.3.01. J. H." At one end was a dark, glossy blood-stain, made by the falling of a good-sized drop, and this was smeared slightly, apparently by a finger or thumb having been pressed on it. Near to it were two or three smaller smears and a remarkably distinct and clean print of a thumb.

Thorndyke gazed intently at the paper for a minute or two, scrutinising the thumb-print and the smears in turn, but making no remark, while Mr. Singleton watched his impassive face with expectant curiosity.

"Not much difficulty in identifying that mark," the official at length observed.

"No," agreed Thorndyke; "it is an excellent impression and a very distinctive pattern, even without the scar."

"Yes," rejoined Mr. Singleton; "the scar makes it absolutely conclusive. You have a print with you, I suppose?"

"Yes," replied Thorndyke, and he drew from a wide flap-pocket the enlarged photograph, at the sight of which Mr. Singleton's face broadened into a smile.

"You don't want to put on spectacles to look at that," he remarked; "not that you gain anything by so much enlargement; three diameters is ample for studying the ridge-patterns. I see you have divided it up into numbered squares—not a bad plan; but ours—or rather Galton's, for we borrowed the method from him—is better for this purpose."

He drew from the portfolio a half-plate photograph of the thumb-print which appeared magnified to about four inches in length. The print was marked by a number of figures written minutely with a fine-pointed pen, each figure being placed on an "island," a loop, a bifurcation or some other striking and characteristic portion of the ridge-pattern.

"This system of marking with reference numbers," said Mr. Singleton, "is better than your method of squares, because the numbers are only placed at points which are important for comparison, whereas your squares or the intersections of the lines fall arbitrarily on important or unimportant points according to chance. Besides, we can't let you mark our original, you know, though, of course, we can give you a photograph, which will do as well."

"I was going to ask you to let me take a photograph presently," said Thorndyke.

"Certainly," replied Mr. Singleton, "if you would rather have one of your own taking. I know you don't care to take anything on trust. And now I must get on with my work, if you will excuse me. Inspector Johnson will give you any assistance you may require."

"And see that I don't pocket the original," added Thorndyke, with a smile at the inspector who had shown us in.

"Oh, I'll see to that," said the latter, grinning; and, as Mr. Singleton returned to his table, Thorndyke unlocked the microscope case and drew forth the instrument.

"What, are you going to put it under the microscope?" exclaimed Mr. Singleton, looking round with a broad smile.

"Must do something for my fee, you know," replied Thorndyke, as he set up the microscope and screwed on two extra objectives to the triple nose-piece.

"You observe that there is no deception," he added to the inspector, as he took the paper from Mr. Singleton's table and placed it between two slips of glass.

"I'm watching you, sir," replied the officer, with a chuckle; and he did watch, with close attention and great interest, while Thorndyke laid the glass slips on the microscope stage and proceeded to focus.

I also watched, and was a good deal exercised in my mind by my colleague's proceedings. After a preliminary glance with the six-inch glass, he swung round the nose-piece to the half-inch objective and slipped in a more powerful eye-piece, and with this power he examined the blood-stains carefully, and then moved the thumb-print into the field of vision. After looking at this for some time with deep attention, he drew from the case a tiny spirit lamp which was evidently filled with an alcoholic solution of some sodium salt, for when he lit it I recognised the characteristic yellow sodium flame. Then he replaced one of the objectives by a spectrosopic attachment, and having placed the little lamp close to the microscope mirror, adjusted the spectroscope. Evidently my friend was fixing the position of the "D" line (or sodium line) in the spectrum.

Having completed the adjustments, he now examined afresh the blood-smears and the thumb-print, both by transmitted and reflected light, and I observed him hurriedly draw one or two diagrams in his notebook. Then he replaced the spectroscope and lamp in the case and brought forth the micrometer—a slip of rather thin glass about three inches by one and a half—which he laid over the thumb-print in the place of the upper plate of glass.
Having secured it in position by the clips, he moved it about, comparing its appearance with that of the lines on the large photograph, which he held in his hand. After a considerable amount of adjustment and readjustment, he appeared to be satisfied, for he remarked to me—

"I think I have got the lines in the same position as they are on our print, so, with Inspector Johnson’s assistance, we will take a photograph which we can examine at our leisure."

He extracted the camera—a quarter-plate instrument—from its case and opened it. Then, having swung the microscope on its stand into a horizontal position, he produced from the camera case a slab of mahogany with three brass feet, on which he placed the camera, and which brought the latter to a level with the eye-piece of the microscope.

The front of the camera was fitted with a short sleeve of thin black leather, and into this the eye-piece end of the microscope was now passed, the sleeve being secured round the barrel of the microscope by a stout indiarubber band, thus producing a completely light-tight connection.

Everything was now ready for taking the photograph. The light from the window having been concentrated on the thumb-print by means of a condenser, Thorndyke proceeded to focus the image on the ground-glass screen with extreme care and then, slipping a small leather cap over the objective, introduced the dark slide and drew out the shutter.

"I will ask you to sit down and remain quite still while I make the exposure," he said to me and the inspector. "A very little vibration is enough to destroy the sharpness of the image."

We seated ourselves accordingly, and Thorndyke then removed the cap, standing motionless, watch in hand, while he exposed the first plate.

"We may as well take a second, in case this should not turn out quite perfect," he said, as he replaced the cap and closed the shutter.

He reversed the dark slide and made another exposure in the same way, and then, having removed the micrometer and replaced it by a slip of plain glass, he made two more exposures.

"There are two plates left," he remarked, as he drew out the second dark slide. "I think I will take a record of the blood-stain on them."

He accordingly made two more exposures—one of the larger blood-stain and one of the smaller smears.

"There," said he, with an air of satisfaction, as he proceeded to pack up what the inspector described as his "box of tricks." "I think we have all the data that we can squeeze out of Scotland Yard, and I am very much obliged to you, Mr. Singleton, for giving so many facilities to your natural enemy, the counsel for the defence."

"Not our natural enemies, doctor," protested Mr. Singleton. "We work for a conviction, of course, but we don’t throw obstacles in the way of the defence. You know that perfectly well."

"Of course I do, my dear sir," replied Thorndyke, shaking the official by the hand. "Haven’t I benefited by your help a score of times? But I am greatly obliged all the same. Good-bye."

"Good-bye, doctor. I wish you luck, though I fear you will find it ‘no go’ this time."

"We shall see," replied Thorndyke, and with a friendly wave of the hand to the inspector he caught up the two cases and led the way out of the building.

IV. — CONFI DENCES

DURING our walk home my friend was unusually thoughtful and silent, and his face bore a look of concentration under which I thought I could detect, in spite of his habitually impassive expression, a certain suppressed excitement of a not entirely unpleasurable kind. I forbore, however, from making any remarks or asking questions, not only because I saw that he was preoccupied, but also because, from my knowledge of the man, I judged that he would consider it his duty to keep his own counsel and to make no unnecessary confidences even to me.

On our arrival at his chambers he immediately handed over the camera to Polton with a few curt directions as to the development of the plates, and, lunch being already prepared, we sat down at the table without delay.

We had proceeded with our meal in silence for some time when Thorndyke suddenly laid down his knife and fork and looked into my face with a smile of quiet amusement.

"It has just been borne in upon me, Jervis," said he, "that you are the most companionable fellow in the world. You have the heaven-sent gift of silence."

"If silence is the test of companionability," I answered, with a grin, "I think I can pay you a similar compliment in even more emphatic terms."

He laughed cheerfully and rejoined—

"You are pleased to be sarcastic, I observe; but I maintain my position. The capacity to preserve an opportune silence is the rarest and most precious of social accomplishments. Now, most men would have plied me with questions and babbled
comments on my proceedings at Scotland Yard, whereas you have allowed me to sort out, without interruption, a mass of evidence while it is still fresh and impressive, to docket each item and stow it away in the pigeonholes of my brain. By the way, I have made a ridiculous oversight."

"What is that?" I asked.

"The 'Thumbograph.' I never ascertained whether the police have it or whether it is still in the possession of Mrs. Hornby."

"Does it matter?" I inquired.

"Not much; only I must see it. And perhaps it will furnish an excellent pretext for you to call on Miss Gibson. As I am busy at the hospital this afternoon and Polton has his hands full, it would be a good plan for you to drop in at Endsley Gardens—that is the address, I think—and if you can see Miss Gibson, try to get a confidential chat with her, and extend your knowledge of the manners and customs of the three Messieurs Hornby. Put on your best bedside manner and keep your weather eye lifting. Find out everything you can as to the characters and habits of those three gentlemen, regardless of all scruples of delicacy. Everything is of importance to us, even to the names of their tailors."

"And with regard to the 'Thumbograph'?"

"Find out who has it, and, if it is still in Mrs. Hornby's possession, get her to lend it to us or—what might, perhaps, be better—get her permission to take a photograph of it."

"It shall be done according to your word," said I. "I will furnish up my exterior, and this very afternoon make my first appearance in the character of Paul Pry."

About an hour later I found myself upon the doorstep of Mr. Hornby's house in Endsley Gardens listening to the jangling of the bell that I had just set in motion.

"Miss Gibson, sir?" repeated the parlourmaid in response to my question. "She was going out, but I am not sure whether she has gone yet. If you will step in, I will go and see."

I followed her into the drawing-room, and, threading my way amongst the litter of small tables and miscellaneous furniture by which ladies nowadays convert their special domain into the semblance of a broker's shop, let go my anchor in the vicinity of the fireplace to await the parlourmaid's report.

I had not long to wait, for in less than a minute Miss Gibson herself entered the room. She wore her hat and gloves, and I congratulated myself on my timely arrival.

"I didn't expect to see you again so soon, Dr. Jervis," she said, holding out her hand with a frank and friendly manner, "but you are very welcome all the same. You have come to tell me something?"

"On the contrary," I replied, "I have come to ask you something."

"Well, that is better than nothing," she said, with a shade of disappointment. "Won't you sit down?"

I seated myself with caution on a dwarf chair of scrofulous aspect, and opened my business without preamble.

"Do you remember a thing called a 'Thumbograph'?"

"Indeed I do," she replied with energy. "It was the cause of all this trouble."

"Do you know if the police took possession of it?"

"The detective took it to Scotland Yard that the finger-print experts might examine it and compare the two thumb-prints; and they wanted to keep it, but Mrs. Hornby was so distressed at the idea of its being used in evidence that they let her have it back. You see, they really had no further need of it, as they could take a print for themselves when they had Reuben in custody; in fact, he volunteered to have a print taken at once, as soon as he was arrested, and that was done."

"So the 'Thumbograph' is now in Mrs. Hornby's possession?"

"Yes, unless she has destroyed it. She spoke of doing so."

"I hope she has not," said I, in some alarm, "for Dr. Thorndyke is extremely anxious, for some reason, to examine it."

"Well, she will be down in a few minutes, and then we shall know. I told her you were here. Have you any idea what Dr. Thorndyke's reason is for wanting to see it?"

"None whatever," I replied. "Dr. Thorndyke is as close as an oyster. He treats me as he treats every one else—he listens attentively, observes closely, and says nothing."

"It doesn't sound very agreeable," mused Miss Gibson; "and yet he seemed very nice and sympathetic."

"He is very nice and sympathetic," I retorted with some emphasis, "but he doesn't make himself agreeable by divulging his clients' secrets."

"I suppose not; and I regard myself as very effectively snubbed," said she, smiling, but evidently somewhat piqued by my not very tactful observation.

I was hastening to repair my error with apologies and self-accusations, when the door opened and an elderly lady
entered the room. She was somewhat stout, amiable and placid of mien, and impressed me (to be entirely truthful) as looking rather foolish.

“Here is Mrs. Hornby,” said Miss Gibson, presenting me to her hostess; and she continued, “Dr. Jervis has come to ask about the ‘Thumbograph.’ You haven’t destroyed it, I hope?”

“No, my dear,” replied Mrs. Hornby. “I have it in my little bureau. What did Dr. Jervis wish to know about it?”

Seeing that she was terrified lest some new and dreadful surprise should be sprung upon her, I hastened to reassure her. “My colleague, Dr. Thorndyke, is anxious to examine it. He is directing your nephew’s defence, you know.”

“Yes, yes,” said Mrs. Hornby. “Juliet told me about him. She says he is a dear. Do you agree with her?”

Here I caught Miss Gibson’s eye, in which was a mischievous twinkle, and noted a little deeper pink in her cheeks.

“Well,” I answered dubiously, “I have never considered my colleague in the capacity of a dear, but I have a very high opinion of him in every respect.”

“That, no doubt, is the masculine equivalent,” said Miss Gibson, recovering from the momentary embarrassment that Mrs. Hornby’s artless repetition of her phrase had produced. ‘I think the feminine expression is more epigrammatic and comprehensive. But to return to the object of Dr. Jervis’s visit. Would you let him have the ‘Thumbograph,’ aunt, to show to Dr. Thorndyke?”

“Oh, my dear Juliet,” replied Mrs. Hornby, “I would do anything—anything—to help our poor boy. I will never believe that he could be guilty of theft—common, vulgar theft. There has been some dreadful mistake—I am convinced there has—I told the detectives so. I assured them that Reuben could not have committed the robbery, and that they were totally mistaken in supposing him to be capable of such an action. But they would not listen to me, although I have known him since he was a little child, and ought to be able to judge, if anyone is. Diamonds, too! Now, I ask you, what could Reuben want with diamonds? and they were not even cut.”

Here Mrs. Hornby drew forth a lace-edged handkerchief and mopped her eyes.

“I am sure Dr. Thorndyke will be very much interested to see this little book of yours,” said I, with a view to stemming the tide of her reflections.

“Oh, the ‘Thumbograph,’” she replied. “Yes, I will let him have it with the greatest pleasure. I am so glad he wishes to see it; it makes one feel hopeful to know that he is taking so much interest in the case. Would you believe it, Dr. Jervis, those detective people actually wanted to keep it to bring up in evidence against the poor boy. My ‘Thumbograph,’ mind you. But I put my foot down there and they had to return it. I was resolved that they should not receive any assistance from me in their efforts to involve my nephew in this horrible affair.”

“Then, perhaps,” said Miss Gibson, “you might give Dr. Jervis the ‘Thumbograph’ and he can hand it to Dr. Thorndyke.”

“Oh, of course I will,” said Mrs. Hornby; “instantly; and you need not return it, Dr. Jervis. When you have finished with it, fling it into the fire. I wish never to see it again.”

But I had been considering the matter, and had come to the conclusion that it would be highly indiscreet to take the book out of Mrs. Hornby’s custody, and this I now proceeded to explain.

“I have no idea,” I said, “for what purpose Dr. Thorndyke wishes to examine the ‘Thumbograph,’ but it occurs to me that he may desire to put it in evidence, in which case it would be better that it should not go out of your possession for the present. He merely commissioned me to ask for your permission to take a photograph of it.”

“Oh, if he wants a photograph,” said Mrs. Hornby, “I could get one done for him without any difficulty. My nephew Walter would take one for us, I am sure, if I asked him. He is so clever, you know—is he not, Juliet, dear?”

“Yes, aunt,” replied Miss Gibson quickly, “but I expect Dr. Thorndyke would rather take the photograph himself.”

“I am sure he would,” I agreed. “In fact, a photograph taken by another person would not be of much use to him.”

“Oh,” said Mrs. Hornby in a slightly injured tone, “you think Walter is just an ordinary amateur; but if I were to show you some of the photographs he has taken you would really be surprised. He is remarkably clever, I assure you.”

“Would you like us to bring the book to Dr. Thorndyke’s chambers?” asked Miss Gibson. “That would save time and trouble.”

“It is excessively good of you—” I began.

“Not at all. When shall we bring it? Would you like to have it this evening?”

“We should very much,” I replied. “My colleague could then examine it and decide what is to be done with it. But it is giving you so much trouble.”

“It is nothing of the kind,” said Miss Gibson. “You would not mind coming with me this evening, would you, aunt?”

“Certainly not, my dear,” replied Mrs. Hornby, and she was about to enlarge on the subject when Miss Gibson rose and, looking at her watch, declared that she must start on her errand at once. I also rose to make my adieux, and she then remarked—
“If you are walking in the same direction as I am, Dr. Jervis, we might arrange the time of our proposed visit as we go along.”

I was not slow to avail myself of this invitation, and a few seconds later we left the house together, leaving Mrs. Hornby smiling fatuously after us from the open door.

“Will eight o’clock suit you, do you think?” Miss Gibson asked, as we walked up the street.

“It will do excellently, I should say,” I answered. “If anything should render the meeting impossible I will send you a telegram. I could wish that you were coming alone, as ours is to be a business conference.”

Miss Gibson laughed softly—and a very pleasant and musical laugh it was.

“Yes,” she agreed. “Dear Mrs. Hornby is a little diffuse and difficult to keep to one subject; but you must be indulgent to her little failings; you would be if you had experienced such kindness and generosity from her as I have.”

“I am sure I should,” I rejoined; “in fact, I am. After all, a little diffuseness of speech and haziness of ideas are no great faults in a generous and amiable woman of her age.”

Miss Gibson rewarded me for these highly correct sentiments with a little smile of approval, and we walked on for some time in silence. Presently she turned to me with some suddenness and a very earnest expression, and said—

“I want to ask you a question, Dr. Jervis, and please forgive me if I beg you to put aside your professional reserve just a little in my favour. I want you to tell me if you think Dr. Thorndyke has any kind of hope or expectation of being able to save poor Reuben from the dreadful peril that threatens him.”

This was a rather pointed question, and I took some time to consider it before replying.

“I should like,” I replied at length, “to tell you as much as my duty to my colleague will allow me to; but that is so little that it is hardly worth telling. However, I may say this without breaking any confidence: Dr. Thorndyke has undertaken the case and is working hard at it, and he would, most assuredly, have done neither the one nor the other if he had considered it a hopeless one.”

“That is a very encouraging view of the matter,” said she, “which, had, however, already occurred to me. May I ask if anything came of your visit to Scotland Yard? Oh, please don’t think me encroaching; I am so terribly anxious and troubled.”

“I can tell you very little about the results of our expedition, for I know very little; but I have an idea that Dr. Thorndyke is not dissatisfied with his morning’s work. He certainly picked up some facts, though I have no idea of their nature, and as soon as we reached home he developed a sudden desire to examine the ‘Thumbograph.’”

“Thank you, Dr. Jervis,” she said gratefully. “You have cheered me more than I can tell you, and I won’t ask you any more questions. Are you sure I am not bringing you out of the way?”

“Not at all,” I answered hastily. “The fact is, I had hoped to have a little chat with you when we had disposed of the ‘Thumbograph,’ so I can regard myself as combining a little business with a great deal of pleasure if I am allowed to accompany you.”

She gave me a little ironical bow as she inquired—

“And, in short, I may take it that I am to be pumped?”

“Come, now,” I retorted. “You have been plying the pump handle pretty vigorously yourself. But that is not my meaning at all. You see, we are absolute strangers to all the parties concerned in this case, which, of course, makes for an impartial estimate of their characters. But, after all, knowledge is more useful to us than impartiality. There is our client, for instance. He impressed us both very favourably, I think; but he might have been a plausible rascal with the blackest of records. Then you come and tell us that he is a gentleman of stainless character and we are at once on firmer ground.”

“I see,” said Miss Gibson thoughtfully; “and suppose that I or some one else had told you things that seemed to reflect on his character. Would they have influenced you in your attitude towards him?”

“Only in this,” I replied; “that we should have made it our business to inquire into the truth of those reports and ascertain their origin.”

“That is what one should always do, I suppose,” said she, still with an air of deep thoughtfulness which encouraged me to inquire—

“May I ask if anyone to your knowledge has ever said anything to Mr. Reuben’s disadvantage?”

She pondered for some time before replying, and kept her eyes bent pensively on the ground. At length she said, not without some hesitation of manner—

“It is a small thing and quite without any bearing on this affair. But it has been a great trouble to me since it has to some extent put a barrier between Reuben and me; and we used to be such close friends. And I have blamed myself for letting it influence me—perhaps unjustly—in my opinion of him. I will tell you about it, though I expect you will think me very foolish.

“You must know, then, that Reuben and I used, until about six months ago, to be very much together, though we were
only friends, you understand. But we were on the footing of relatives, so there was nothing out of the way in it. Reuben is a keen student of ancient and mediaeval art, in which I also am much interested, so we used to visit the museums and galleries together and get a great deal of pleasure from comparing our views and impressions of what we saw.

"About six months ago, Walter took me aside one day and, with a very serious face, asked me if there was any kind of understanding between Reuben and me. I thought it rather impertinent of him, but nevertheless, I told him the truth, that Reuben and I were just friends and nothing more.

"If that is the case,' said he, looking mighty grave, 'I would advise you not to be seen about with him quite so much.'

"And why not?" I asked very naturally.

"Why, the fact is,' said Walter, 'that Reuben is a confounded fool. He has been chattering to the men at the club and seems to have given them the impression that a young lady of means and position has been setting her cap at him very hard, but that he, being a high-souled philosopher above the temptations that beset ordinary mortals, is superior both to her blandishments and her pecuniary attractions. I give you the hint for your own guidance,' he continued, 'and I expect this to go no farther. You mustn't be annoyed with Reuben. The best of young men will often behave like prigs and donkeys, and I have no doubt the fellows have grossly exaggerated what he said; but I thought it right to put you on your guard.'

"Now this report, as you may suppose, made me excessively angry, and I wanted to have it out with Reuben then and there. But Walter refused to sanction this—there was no use in making a scene' he said—and he insisted that the caution was given to me in strict confidence; so what was I to do? I tried to ignore it and treat Reuben as I always had done, but this I found impossible; my womanly pride was much too deeply hurt. And yet I felt it the lowest depth of meanness to harbour such thoughts of him without giving him the opportunity to defend himself. And although it was most unlike Reuben in some respects, it was very like him in others; for he has always expressed the utmost contempt for men who marry for a livelihood. So I have remained on the horns of a dilemma and am there still. What do you think I ought to have done?"

I rubbed my chin in some embarrassment at this question. Needless to say, I was most disagreeably impressed by Walter Hornby's conduct, and not a little disposed to blame my fair companion for giving an ear to his secret disparagement of his cousin; but I was obviously not in a position to pronounce, offhand, upon the merits of the case.

"The position appears to be this," I said, after a pause, "either Reuben has spoken most unworthily and untruthfully of you, or Walter has lied deliberately about him."

"Yes," she agreed, "that is the position; but which of the two alternatives appears to you the more probable?"

"That is very difficult to say," I answered. "There is a certain kind of cad who is much given to boastful rhodomontade concerning his conquests. We all know him and can generally spot him at first sight, but I must say that Reuben Hornby did not strike me as that kind of man at all. Then it is clear that the proper course for Walter to have adopted, if he had really heard such rumours, was to have had the matter out with Reuben, instead of coming secretly to you with whispered reports. That is my feeling, Miss Gibson, but, of course, I may be quite wrong. I gather that our two young friends are not inseparable companions?"

"Oh, they are very good friends, but you see, their interests and views of life are quite different. Reuben, although an excellent worker in business hours, is a student, or perhaps rather what one would call a scholar, whereas Walter is more a practical man of affairs—decidedly long-headed and shrewd. He is undoubtedly very clever, as Mrs. Hornby said."

"He takes photographs, for instance," I suggested.

"Yes. But not ordinary amateur photographs; his work is more technical and quite excellent of its kind. For example, he did a most beautiful series of micro-photographs of sections of metalliferous rocks which he reproduced for publication by the collotype process, and even printed off the plates himself."

"I see. He must be a very capable fellow."

"He is, very," she assented, "and very keen on making a position; but I am afraid he is rather too fond of money for its own sake, which is not a pleasant feature in a young man's character, is it?"

I agreed that it was not.

"Excessive keenness in money affairs," proceeded Miss Gibson oracularly, "is apt to lead a young man into bad ways—oh, you need not smile, Dr. Jervis, at my wise saws; it is perfectly true, and you know it. The fact is, I sometimes have an uneasy feeling that Walter's desire to be rich inclines him to try what looks like a quick and easy method of making money. He had a friend—a Mr. Horton—who is a dealer on the Stock Exchange and who 'operates' rather largely—'operate' I believe is the expression used, although it seems to be nothing more than common gambling—and I have more than once suspected Walter of being concerned in what Mr. Horton calls 'a little flutter.'"

"That doesn't strike me as a very long-headed proceeding," I remarked, with the impartial wisdom of the impecunious, and therefore untempted.

"No," she agreed, "it isn't. But your gambler always thinks he is going to win—though you mustn't let me give you the impression that Walter is a gambler. But here is my destination. Thank you for escorting me so far, and I hope you are
beginning to feel less like a stranger to the Hornby family. We shall make our appearance to-night at eight punctually.”

She gave me her hand with a frank smile and tripped up the steps leading to the street door; and when I glanced back, after crossing the road, she gave me a little friendly nod as she turned to enter the house.

V. — THE ‘THUMBOGRAPH’

“SO your net has been sweeping the quiet and pleasant waters of feminine conversation,” remarked Thorndyke when we met at the dinner table and I gave him an outline of my afternoon’s adventures.

“Yes,” I answered, “and here is the catch cleaned and ready for the consumer.”

I laid on the table two of my notebooks in which I had entered such facts as I had been able to extract from my talk with Miss Gibson.

“You made your entries as soon as possible after your return, I suppose?” said Thorndyke—“while the matter was still fresh?”

“I wrote down my notes as I sat on a seat in Kensington Gardens within five minutes after leaving Miss Gibson.”

“Good!” said Thorndyke. “And now let us see what you have collected.”

He glanced quickly through the entries in the two books, referring back once or twice, and stood for a few moments silent and abstracted. Then he laid the little books down on the table with a satisfied nod.

“Our information, then,” he said, “amounts to this: Reuben is an industrious worker at his business and, in his leisure, a student of ancient and medieval art; possibly a babbling fool and a cad or, on the other hand, a malign and much-abused man.

“Walter Hornby is obviously a sneak and possibly a liar; a keen man of business, perhaps a fluctuator round the financial candle that burns in Throgmorton Street; an expert photographer and a competent worker of the collotype process. You have done a very excellent day’s work, Jervis. I wonder if you see the bearing of the facts that you have collected.”

“I think I see the bearing of some of them,” I answered; “at least, I have formed certain opinions.”

“Then keep them to yourself, mon ami, so that I need not feel as if I ought to unbosom myself of my own views.”

“I should be very much surprised if you did, Thorndyke,” I replied, “and should have none the better opinion of you. I realise fully that your opinions and theories are the property of your client and not to be used for the entertainment of your friends.”

Thorndyke patted me on the back playfully, but he looked uncommonly pleased, and said, with evident sincerity, “I am really grateful to you for saying that, for I have felt a little awkward in being so reticent with you who know so much of this case. But you are quite right, and I am delighted to find you so discerning and sympathetic. The least I can do under the circumstances is to uncork a bottle of Pommard, and drink the health of so loyal and helpful a colleague. Ah! Praise the gods! here is Polton, like a sacrificial priest accompanied by a sweet savour of roasted flesh. Rump steak I ween,” he added, sniffing, “food meet for the mighty Shamash (that pun was fortuitous, I need not say) or a ravenous medical jurist. Can you explain to me, Polton, how it is that your rump steak is better than any other steak? Is it that you have command of a special brand of ox?”

The little man’s dry countenance wrinkled with pleasure until it was as full of lines as a ground-plan of Clapham Junction.

“Perhaps it is the special treatment it gets, sir,” he replied. “I usually bruise it in the mortar before cooking, without breaking up the fibre too much, and then I heat up the little cupel furnace to about 600 C, and put the steak in on a tripod.”

Thorndyke laughed outright. “The cupel furnace, too,” he exclaimed. “Well, well, ‘to what base uses’—but I don’t know that it is a base use after all. Anyhow, Polton, open a bottle of Pommard and put a couple of ten by eight ‘process’ plates in your dark slides. I am expecting two ladies here this evening with a document.”

“Shall you bring them upstairs, sir?” inquired Polton, with an alarmed expression.

“I expect I shall have to,” answered Thorndyke.

“Then I shall just smarten the laboratory up a bit,” said Polton, who evidently appreciated the difference between the masculine and feminine view as to the proper appearance of working premises.

“And so Miss Gibson wanted to know our private views on the case?” said Thorndyke, when his voracity had become somewhat appeased.

“Yes,” I answered; and then I repeated our conversation as nearly as I could remember it.

“Your answer was very discreet and diplomatic,” Thorndyke remarked, “and it was very necessary that it should be, for it is essential that we show the backs of our cards to Scotland Yard; and if to Scotland Yard, then to the whole world. We know what their trump card is and can arrange our play accordingly, so long as we do not show our hand.”
“You speak of the police as your antagonists; I noticed that at the ‘Yard’ this morning, and was surprised to find that they accepted the position. But surely their business is to discover the actual offender, not to fix the crime on some particular person.”

“That would seem to be so,” replied Thorndyke, “but in practice it is otherwise. When the police have made an arrest they work for a conviction. If the man is innocent, that is his business, not theirs; it is for him to prove it. The system is a pernicious one—especially since the efficiency of a police officer is, in consequence, apt to be estimated by the number of convictions he has secured, and an inducement is thus held out to him to obtain a conviction, if possible; but it is of a piece with legislative procedure in general. Lawyers are not engaged in academic discussions or in the pursuit of truth, but each is trying, by hook or by crook, to make out a particular case without regard to its actual truth or even to the lawyer’s own belief on the subject. That is what produces so much friction between lawyers and scientific witnesses; neither can understand the point of view of the other. But we must not sit over the table chattering like this; it has gone half-past seven, and Polton will be wanting to make this room presentable.”

“I notice you don’t use your office much,” I remarked.

“Hardly at all, excepting as a repository for documents and stationery. It is very cheerless to talk in an office, and nearly all my business is transacted with solicitors and counsel who are known to me, so there is no need for such formalities. All right, Polton; we shall be ready for you in five minutes.”

The Temple bell was striking eight as, at Thorndyke’s request, I threw open the iron-bound “oak”; and even as I did so the sound of footsteps came up from the stairs below. I waited on the landing for our two visitors, and led them into the room.

“I am so glad to make your acquaintance,” said Mrs. Hornby, when I had done the honours of introduction; “I have heard so much about you from Juliet—”

“Really, my dear aunt,” protested Miss Gibson, as she caught my eye with a look of comical alarm, “you will give Dr. Thorndyke a most erroneous impression. I merely mentioned that I had intruded on him without notice and had been received with undeserved indulgence and consideration.”

“You didn’t put it quite in that way, my dear,” said Mrs. Hornby, “but I suppose it doesn’t matter.”

“We are highly gratified by Mrs. Gibson’s favourable report of us, whatever may have been the actual form of expression,” said Thorndyke, with a momentary glance at the younger lady which covered her with smiling confusion, “and we are deeply indebted to you for taking so much trouble to help us.”

“It is no trouble at all, but a great pleasure,” replied Mrs. Hornby; and she proceeded to enlarge on the matter until her remarks threatened, like the rippling circles produced by a falling stone, to spread out into infinity. In the midst of this discourse Thorndyke placed chairs for the two ladies, and, leaning against the mantelpiece, fixed a stony gaze upon the small handbag that hung from Mrs. Hornby’s wrist.

“Is the ‘Thumbograph’ in your bag?” interrupted Miss Gibson, in response to this mute appeal.

“Of course it is, my dear Juliet,” replied the elder lady. “You saw me put it in yourself. What an odd girl you are. Did you think I should have taken it out and put it somewhere else? Not that these handbags are really very secure, you know, although I daresay they are safer than pockets, especially now that it is the fashion to have the pocket at the back. Still, I have often thought how easy it would be for a thief or a pickpocket or some other dreadful creature of that kind, don’t you know, to make a snatch and—in fact, the thing has actually happened. Why, I knew a lady—Mrs. Moggridge, you know, Juliet—no, it wasn’t Mrs. Moggridge, that was another affair, it was Mrs.—Mrs.—dear me, how silly of me!—now, what was her name? Can’t you help me, Juliet? You must surely remember the woman. She used to visit a good deal at the Hawley-Johnsons’—I think it was the Hawley-Johnsons’, or else it was those people, you know—”

“Hadn’t you better give Dr. Thorndyke the ‘Thumbograph’?” interrupted Miss Gibson.

“Why, of course, Juliet, dear. What else did we come here for?” With a slightly injured expression, Mrs. Hornby opened the little bag and commenced, with the utmost deliberation, to turn out its contents on to the table. These included a laced handkerchief, a purse, a card-case, a visiting list, a packet of papier poudré, and when she had laid the last-mentioned article on the table, she paused abruptly and gazed into Miss Gibson’s face with the air of one who has made a startling discovery.

“I remember the woman’s name,” she said in an impressive voice. “It was Gudge—Mrs. Gudge, the sister-in-law of—”

Here Miss Gibson made an unceremonious dive into the open bag and fished out a tiny parcel wrapped in notepaper and secured with a silk thread.

“Thank you,” said Thorndyke, taking it from her hand just as Mrs. Hornby was reaching out to intercept it. He cut the thread and drew from its wrappings a little book bound in red cloth, with the word “Thumbograph” stamped upon the cover, and was beginning to inspect it when Mrs. Hornby rose and stood beside him.

“That,” said she, as she opened the book at the first page, “is the thumb-mark of a Miss Colley. She is no connection of ours. You see it is a little smeared—she said Reuben jogged her elbow, but I don’t think he did; at any rate he assured me he did not, and, you know—”
“Ah! Here is one we are looking for,” interrupted Thorndyke, who had been turning the leaves of the book regardless of Mrs. Hornby’s rambling comments; “a very good impression, too, considering the rather rough method of producing it.”

He reached out for the reading lens that hung from its nail above the mantelpiece, and I could tell by the eagerness with which he peered through it at the thumb-print that he was looking for something. A moment later I felt sure that he had found that something which he had sought, for, though he replaced the lens upon its nail with a quiet and composed air and made no remark, there was a sparkle of the eye and a scarcely perceptible flush of suppressed excitement and triumph which I had begun to recognise beneath the impassive mask that he presented to the world.

“I shall ask you to leave this little book with me, Mrs. Hornby,” he said, breaking in upon that lady’s inconsequent babblings, “and, as I may possibly put it in evidence, it would be a wise precaution for you and Miss Gibson to sign your names—as small as possible—on the page which bears Mr. Reuben’s thumb-mark. That will anticipate any suggestion that the book has been tampered with after leaving your hands.”

“It would be a great impertinence for anyone to make any such suggestion,” Mrs. Hornby began; but on Thorndyke’s placing his fountain pen in her hand, she wrote her signature in the place indicated and handed the pen to Miss Gibson, who signed underneath.

“And now,” said Thorndyke, “we will take an enlarged photograph of this page with the thumb-mark; not that it is necessary that it should be done now, as you are leaving the book in my possession; but the photograph will be wanted, and as my man is expecting us and has the apparatus ready, we may as well despatch the business at once.”

To this both the ladies readily agreed (being, in fact, devoted by curiosity with regard to my colleague’s premises), and we accordingly proceeded to invade the set of rooms on the floor above, over which the ingenious Polton was accustomed to reign in solitary grandeur.

It was my first visit to these mysterious regions, and I looked about me with as much curiosity as did the two ladies. The first room that we entered was apparently the workshop, for it contained a small woodworker’s bench, a lathe, a bench for metal work and a number of mechanical appliances which I was not then able to examine; but I noticed that the entire place presented to the eye a most unworkmanlike neatness, a circumstance that did not escape Thorndyke’s observation, for his face relaxed into a grim smile as his eye travelled over the bare benches and the clean-swept floor.

From this room we entered the laboratory, a large apartment, one side of which was given up to chemical research, as was shown by the shelves of reagents that covered the wall, and the flasks, retorts and other apparatus that were arranged on the bench, like ornaments on a drawing-room mantelpiece. On the opposite side of the room was a large, massively-constructed copying camera, the front of which, carrying the lens, was fixed, and an easel or copyholder travelled on parallel guides towards, or away, from it, on a long stand.

This apparatus Thorndyke proceeded to explain to our visitors while Polton was fixing the “Thumbograph” in a holder attached to the easel.

“You see,” he said, in answer to a question from Miss Gibson, “I have a good deal to do with signatures, cheques and disputed documents of various kinds. Now a skilled eye, aided by a pocket-lens, can make out very minute details on a cheque or bank-note; but it is not possible to lend one’s skilled eye to a judge or jurymen, so that it is often very convenient to be able to hand them a photograph in which the magnification is already done, which they can compare with the original. Small things, when magnified, develop quite unexpected characters; for instance, you have handled a good many postage stamps, I suppose, but have you ever noticed the little white spots in the upper corner of a penny stamp, or even the difference in the foliage on the two sides of the wreath?”

Miss Gibson admitted that she had not.

“Very few people have, I suppose, excepting stamp-collectors,” continued Thorndyke; “but now just glance at this and you will find these unnoticed details forced upon your attention.” As he spoke, he handed her a photograph, which he had taken from a drawer, showing a penny stamp enlarged to a length of eight inches.

While the ladies were marveling over this production, Polton proceeded with his work. The “Thumbograph” having been fixed in position, the light from a powerful incandescent gas lamp, fitted with a parabolic reflector, was concentrated on it, and the camera racked out to its proper distance.

“What are those figures intended to show?” inquired Miss Gibson, indicating the graduation on the side of one of the guides.

“They show the amount of magnification or reduction,” Thorndyke explained. “When the pointer is opposite 0, the photograph is the same size as the object photographed; when it points to, say, × 4, the photograph will be four times the width and length of the object, while if it should point to, say, × 4, the photograph will be one-fourth the length of the object. It is now, you see, pointing to × 8, so the photograph will be eight times the diameter of the original thumb-mark.”

By this time Polton had brought the camera to an accurate focus and, when we had all been gratified by a glimpse of the enlarged image on the focussing screen, we withdrew to a smaller room which was devoted to bacteriology and microscopical research, while the exposure was made and the plate developed. Here, after an interval, we were joined by Polton, who bore with infinite tenderness the dripping negative on which could be seen the grotesque transparency of a colossal thumb-mark.
This Thorndyke scrutinised eagerly, and having pronounced it satisfactory, informed Mrs. Hornby that the object of her visit was attained, and thanked her for the trouble she had taken.

"I am very glad we came," said Miss Gibson to me, as a little later we walked slowly up Mitre Court in the wake of Mrs. Hornby and Thorndyke; "and I am glad to have seen these wonderful instruments, too. It has made me realise that something is being done and that Dr. Thorndyke really has some object in view. It has really encouraged me immensely."

"And very properly so," I replied. "I, too, although I really know nothing of what my colleague is doing, feel very strongly that he would not take all this trouble and give up so much valuable time if he had not some very definite purpose and some substantial reasons for taking a hopeful view."

"Thank you for saying that," she rejoined warmly; "and you will let me have a crumb of comfort when you can, won't you?" She looked in my face so wistfully as she made this appeal that I was quite moved; and, indeed, I am not sure that my state of mind at that moment did not fully justify my colleague's reticence towards me.

However, I, fortunately, had nothing to tell, and so, when we emerged into Fleet Street to find Mrs. Hornby already ensconced in a hansom, I could only promise, as I grasped the hand that she offered to me, to see her again at the earliest opportunity—a promise which my inner consciousness assured me would be strictly fulfilled.

"You seem to be on quite confidential terms with our fair friend," Thorndyke remarked, as we strolled back towards his chambers. "You are an insinuating dog, Jervis."

"She is very frank and easy to get on with," I replied.

"Yes. A good girl and a clever girl, and comely to look upon withal. I suppose it would be superfluous for me to suggest that you mind your eye?"

"I shouldn't, in any case, try to cut out a man who is under a cloud," I replied sulkily.

"Of course you wouldn't; hence the need of attention to the ophthalmic member. Have you ascertained what Miss Gibson's actual relation is to Reuben Hornby?"

"No," I answered.

"It might be worth while to find out," said Thorndyke; and then he relapsed into silence.

VI. — COMMITTED FOR TRIAL

THORNDYKE'S hint as to the possible danger foreshadowed by my growing intimacy with Juliet Gibson had come upon me as a complete surprise, and had, indeed, been resented by me as somewhat of an impertinence. Nevertheless, it gave me considerable food for meditation, and I presently began to suspect that the watchful eyes of my observant friend might have detected something in my manner towards Miss Gibson suggestive of sentiments that had been unsuspected by myself.

Of course it would be absurd to suppose that any real feeling could have been engendered by so ridiculously brief an acquaintance. I had only met the girl three times, and even now, excepting for business relations, was hardly entitled to more than a bow of recognition. But yet, when I considered the matter impartially and examined my own consciousness, I could not but recognise that she had aroused in me an interest which bore no relation to the part that she had played in the drama that was so slowly unfolding. She was undeniably a very handsome girl, and her beauty was of a type that specially appealed to me—full of dignity and character that gave promise of a splendid middle age. And her personality was in other ways not less attractive, for she was frank and open, sprightly and intelligent, and though evidently quite self-reliant, was in nowise lacking in that womanly softness that so strongly engages a man's sympathy.

In short, I realised that, had there been no such person as Reuben Hornby, I should have viewed Miss Gibson with uncommon interest.

But, unfortunately, Reuben Hornby was a most palpable reality, and, moreover, the extraordinary difficulties of his position entitled him to very special consideration by any man of honour. It was true that Miss Gibson had repudiata any feelings towards Reuben other than those of old-time friendship; but young ladies are not always impartial judges of their own feelings, and, as a man of the world, I could not but have my own opinion on the matter—which opinion I believed to be shared by Thorndyke. The conclusions to which my cogitations at length brought me were: first, that I was an egotistical donkey, and, second, that my relations with Miss Gibson were of an exclusively business character and must in future be conducted on that basis, with the added consideration that I was the confidential agent, for the time being, of Reuben Hornby, and in honour bound to regard his interests as paramount.

"I am hoping," said Thorndyke, as he held out his hand for my teacup, "that these profound reflections of yours are connected with the Hornby affair; in which case I should expect to hear that the riddle is solved and the mystery made plain."

"Why should you expect that?" I demanded, reddening somewhat, I suspect, as I met his twinkling eye. There was something rather disturbing in the dry, quizzical smile that I encountered and the reflection that I had been under observation, and I felt as much embarrassed as I should suppose a self-conscious water-flea might feel on finding itself on
the illuminated stage of a binocular microscope.

“My dear fellow,” said Thorndyke, “you have not spoken a word for the last quarter of an hour; you have devoured your food with the relentless regularity of a sausage-machine, and you have, from time to time, made the most damnable faces at the coffee-pot—though there I'll wager the coffee-pot was even with you, if I may judge by the presentment that it offers of my own countenance.”

I roused myself from my reverie with a laugh at Thorndyke’s quaint conceit and a glance at the grotesquely distorted reflection of my face in the polished silver.

“'I am afraid I have been a rather dull companion this morning,’” I admitted apologetically.

“'By no means,’” replied Thorndyke, with a grin. “'On the contrary, I have found you both amusing and instructive, and I only spoke when I had exhausted your potentialities as a silent entertainer.”

“You are pleased to be facetious at my expense,” said I.

“Well, the expense was not a very heavy one,” he retorted. “I have been merely consuming a by-product of your mental activity—Hallo! that’s Anstey already.”

A peculiar knock, apparently delivered with the handle of a walking-stick on the outer door, was the occasion of this exclamation, and as Thorndyke sprang up and flung the door open, a clear, musical voice was borne in, the measured cadences of which proclaimed at once the trained orator.

“Hail, learned brother!” it exclaimed. “Do I disturb you untimely at your studies?” Here our visitor entered the room and looked round critically. “'Tis even so,” he declared. “Physiological chemistry and its practical applications appears to be the subject. A physico-chemical inquiry into the properties of streaky bacon and fried eggs. Do I see another learned brother?”

He peered keenly at me through his pince-nez, and I gazed at him in some embarrassment.

“This is my friend Jervis, of whom you have heard me speak,” said Thorndyke. “He is with us in this case, you know.”

“The echoes of your fame have reached me, sir,” said Anstey, holding out his hand. “I am proud to know you. I should have recognised you instantly from the portrait of your lamented uncle in Greenwich Hospital.”

“Anstey is a wag, you understand,” explained Thorndyke, “but he has lucid intervals. He'll have one presently if we are patient.”

“Patient!” snorted our eccentric visitor, “it is I who need to be patient when I am dragged into police courts and other sinks of iniquity to plead for common thieves and robbers like a Kennington Lane advocate.”

“You've been talking to Lawley, I see,” said Thorndyke.

“Yes, and he tells me that we haven’t a leg to stand upon.”

“No, we've got to stand on our heads, as men of intellect should. But Lawley knows nothing about the case.”

“He thinks he knows it all,” said Anstey.

“Most fools do,” retorted Thorndyke. “They arrive at their knowledge by intuition—a deuced easy road and cheap travelling too. We reserve our defence—I suppose you agree to that?”

“I suppose so. The magistrate is sure to commit unless you have an unquestionable alibi.”

“We shall put in an alibi, but we are not depending on it.”

“Then we had better reserve our defence,” said Anstey; “and it is time that we wended on our pilgrimage, for we are due at Lawley’s at half-past ten. Is Jervis coming with us?”

“Yes, you’d better come,” said Thorndyke. “It’s the adjourned hearing of poor Hornby’s case, you know. There won’t be anything done on our side, but we may be able to glean some hint from the prosecution.”

“I should like to hear what takes place, at any rate,” I said, and we accordingly sallied forth together in the direction of Lincoln’s Inn, on the north side of which Mr. Lawley's office was situated.

“Ahi!” said the solicitor, as we entered, “I am glad you've come; I was getting anxious—it doesn’t do to be late on these occasions, you know. Let me see, do you know Mr. Walter Hornby? I don’t think you do.” He presented Thorndyke and me to our client’s cousin, and as we shook hands, we viewed one another with a good deal of mutual interest.

“I have heard about you from my aunt,” said he, addressing himself more particularly to me. “She appears to regard you as a kind of legal Maskelyne and Cooke. I hope, for my cousin’s sake, that you will be able to work the wonders that she anticipates. Poor old fellow! He looks pretty bad, doesn’t he?”

I glanced at Reuben, who was at the moment talking to Thorndyke, and as he caught my eye he held out his hand with a warmth that I found very pathetic. He seemed to have aged since I had last seen him, and was pale and rather thinner, but he was composed in his manner and seemed to me to be taking his trouble very well on the whole.

“Cab's at the door, sir,” a clerk announced.

“Cab,” repeated Mr. Lawley, looking dubiously at me; “we want an omnibus.”
“Dr. Jervis and I can walk,” Walter Hornby suggested. “We shall probably get there as soon as you, and it doesn’t matter if we don’t.”

“Yes, that will do,” said Mr. Lawley; “you two walk down together. Now let us go.”

We trooped out on to the pavement, beside which a four-wheeler was drawn up, and as the others were entering the cab, Thorndyke stood close beside me for a moment.

“Don’t let him pump you,” he said in a low voice, without looking at me; then he sprang into the cab and slammed the door.

“What an extraordinary affair this is,” Walter Hornby remarked, after we had been walking in silence for a minute or two; “a most ghastly business. I must confess that I can make neither head nor tail of it.”

“How is that?” I asked.

“Why, do you see, there are apparently only two possible theories of the crime, and each of them seems to be unthinkable. On the one hand there is Reuben, a man of the most scrupulous honour, as far as my experience of him goes, committing a mean and sordid theft for which no motive can be discovered—for he is not poor, nor pecuniarily embarrassed nor in the smallest degree avaricious. On the other hand, there is this thumb-print, which, in the opinion of the experts, is tantamount to the evidence of an eye-witness that he did commit the theft. It is positively bewildering. Don’t you think so?”

“As you put it,” I answered, “the case is extraordinarily puzzling.”

“But how else would you put it?” he demanded, with ill-concealed eagerness.

“I mean that, if Reuben is the man you believe him to be, the thing is incomprehensible.”

“Quite so,” he agreed, though he was evidently disappointed at my colourless answer.

He walked on silently for a few minutes and then said: “I suppose it would not be fair to ask if you see any way out of the difficulty? We are all, naturally anxious about the upshot of the affair, seeing what poor old Reuben’s position is.”

“Naturally. But the fact is that I know no more than you do, and as to Thorndyke, you might as well cross-examine a Whitstable native as put questions to him.”

“Yes, so I gathered from Juliet. But I thought you might have gleaned some notion of the line of defence from your work in the laboratory—the microscopical and photographic work I mean.”

“I was never in the laboratory until last night, when Thorndyke took me there with your aunt and Miss Gibson; the work there is done by the laboratory assistant, and his knowledge of the case, I should say, is about as great as a type-founder’s knowledge of the books that he is helping to produce. No; Thorndyke is a man who plays a single-handed game and no one knows what cards he holds until he lays them on the table.”

My companion considered this statement in silence while I congratulated myself on having parried, with great adroitness, a rather inconvenient question. But the time was not far distant when I should have occasion to reproach myself bitterly for having been so explicit and emphatic.

“My uncle’s condition,” Walter resumed after a pause, “is a pretty miserable one at present, with this horrible affair added to his own personal worries.”

“Has he any special trouble besides this, then?” I asked.

“Why, haven’t you heard? I thought you knew about it, or I shouldn’t have spoken—not that it is in any way a secret, seeing that it is public property in the city. The fact is that his financial affairs are a little entangled just now.”

“Indeed!” I exclaimed, considerably startled by this new development.

“Yes, things have taken a rather awkward turn, though I think he will pull through all right. It is the usual thing, you know—investments, or perhaps one should say speculations. He appears to have sunk a lot of capital in mines—thought he was ‘in the know,’ not unnaturally; but it seems he wasn’t after all, and the things have gone wrong, leaving him with a deal more money than he can afford locked up and the possibility of a dead loss if they don’t revive. Then there are these infernal diamonds. He is not morally responsible, we know; but it is a question if he is not legally responsible, though the lawyers think he is not. Anyhow, there is going to be a meeting of the creditors to-morrow.”

“And what do you think they will do?”

“Oh, they will, most probably, let him go on for the present; but, of course, if he is made accountable for the diamonds there will be nothing for it but to ‘go through the hoop,’ as the sporting financier expresses it.”

“The diamonds were of considerable value, then?”

“From twenty-five to thirty thousand pounds’ worth vanished with that parcel.”

I whistled. This was a much bigger affair than I had imagined, and I was wondering if Thorndyke had realised the magnitude of the robbery, when we arrived at the police court.

“I suppose our friends have gone inside,” said Walter. “They must have got here before us.”
This supposition was confirmed by a constable of whom we made inquiry, and who directed us to the entrance to the court. Passing down a passage and elbowing our way through the throng of idlers, we made for the solicitor’s box, where we had barely taken our seats when the case was called.

Unspeakably dreary and depressing were the brief proceedings that followed, and dreadfully suggestive of the helplessness of even an innocent man on whom the law has laid its hand and in whose behalf its inexorable machinery has been set in motion.

The presiding magistrate, emotionless and dry, dipped his pen while Reuben, who had surrendered to his bail, was placed in the dock and the charge read over to him. The counsel representing the police gave an abstract of the case with the matter-of-fact air of a house-agent describing an eligible property. Then, when the plea of “not guilty” had been entered, the witnesses were called. There were only two, and when the name of the first, John Hornby, was called, I glanced towards the witness-box with no little curiosity.

I had not hitherto met Mr. Hornby, and as he now entered the box, I saw an elderly man, tall, florid, and well-preserved, but strained and wild in expression and displaying his uncontrollable agitation by continual nervous movements which contrasted curiously with the composed demeanour of the accused man. Nevertheless, he gave his evidence in a perfectly connected manner, recounting the events connected with the discovery of the crime in much the same words as I had heard Mr. Lawley use, though, indeed, he was a good deal more emphatic than that gentleman had been in regard to the excellent character borne by the prisoner.

After him came Mr. Singleton, of the finger-print department at Scotland Yard, to whose evidence I listened with close attention. He produced the paper which bore the thumb-print in blood (which had previously been identified by Mr. Hornby) and a paper bearing the print, taken by himself, of the prisoner’s left thumb. These two thumb-prints, he stated, were identical in every respect.

“And you are of opinion that the mark on the paper that was found in Mr. Hornby’s safe, was made by the prisoner’s left thumb?” the magistrate asked in dry and business-like tones.

“I am certain of it.”

“You are of opinion that no mistake is possible?”

“No mistake is possible, your worship. It is a certainty.”

The magistrate looked at Anstey inquiringly, whereupon the barrister rose.

“We reserve our defence, your worship.”

The magistrate then, in the same placid, business-like manner, committed the prisoner for trial at the Central Criminal Court, refusing to accept bail for his appearance, and, as Reuben was led forth from the dock, the next case was called.

By special favour of the authorities, Reuben was to be allowed to make his journey to Holloway in a cab, thus escaping the horrors of the filthy and verminous prison van, and while this was being procured, his friends were permitted to wish him farewell.

“This is a hard experience, Hornby,” said Thorndyke, when we three were, for a few moments, left apart from the others; and as he spoke the warmth of a really sympathetic nature broke through his habitual impassivity. “But be of good cheer; I have convinced myself of your innocence and have good hopes of convincing the world—though this is for your private ear, you understand, to be mentioned to no one.”

Reuben wrung the hand of this “friend in need,” but was unable, for the moment, to speak; and, as his self-control was evidently strained to the breaking point, Thorndyke, with a man’s natural instinct, wished him a hasty good-bye, and passing his hand through my arm, turned away.

“I wish it had been possible to save the poor fellow from this delay, and especially from the degradation of being locked up in a jail,” he exclaimed regretfully as we walked down the street.

“There is surely no degradation in being merely accused of a crime,” I answered, without much conviction, however. “It may happen to the best of us; and he is still an innocent man in the eyes of the law.”

“That, my dear Jervis, you know, as well as I do, to be mere casuistry,” he rejoined. “The law professes to regard the unconvicted man as innocent; but how does it treat him? You heard how the magistrate addressed our friend; outside the court he would have called him Mr. Hornby. You know what will happen to Reuben at Holloway. He will be ordered about by warders, will have a number label fastened on to his coat, he will be locked in a cell with a spy-hole in the door, through which any passing stranger may watch him; his food will be handed to him in a tin pan with a tin knife and spoon; and he will be periodically called out of his cell and driven round the exercise yard with a mob composed, for the most part, of the sweepings of the London slums. If he is acquitted, he will be turned loose without a suggestion of compensation or apology for these indignities or the losses he may have sustained through his detention.”

“Still I suppose these evils are unavoidable,” I said.

“That may or may not be,” he retorted. “My point is that the presumption of innocence is a pure fiction; that the treatment of an accused man, from the moment of his arrest, is that of a criminal. However,” he concluded, hailing a passing hansom, “this discussion must be adjourned or I shall be late at the hospital. What are you going to do?”
“I shall get some lunch and then call on Miss Gibson to let her know the real position.”

“Yes, that will be kind, I think; boldly stated, the news may seem rather alarming. I was tempted to thrash the case out in the police court, but it would not have been safe. He would almost certainly have been committed for trial after all, and then we should have shown our hand to the prosecution.”

He sprang into the hansom and was speedily swallowed up in the traffic, while I turned back towards the police court to make certain inquiries concerning the regulations as to visitors at Holloway prison. At the door I met the friendly inspector from Scotland Yard, who gave me the necessary information, whereupon with a certain homely little French restaurant in my mind I bent my steps in the direction of Soho.

VII. — SHOALS AND QUICKSANDS

WHEN I arrived at Endsley Gardens, Miss Gibson was at home, and to my unspeakable relief, Mrs. Hornby was not. My veneration for that lady’s moral qualities was excessive, but her conversation drove me to the verge of insanity—an insanity not entirely free from homicidal tendencies.

“It is good of you to come—though I thought you would,” Miss Gibson said impulsively, as we shook hands. “You have been so sympathetic and human—both you and Dr. Thorndyke—so free from professional stiffness. My aunt went off to see Mr. Lawley directly we got Walter’s telegram.”

“I am sorry for her,” I said (and was on the point of adding “and him,” but fortunately a glimmer of sense restrained me); “she will find him dry enough.”

“Yes; I dislike him extremely. Do you know that he had the impudence to advise Reuben to plead ‘guilty’?”

“He told us he had done so, and got a well-deserved snubbing from Thorndyke for his pains.”

“I am so glad,” exclaimed Miss Gibson viciously. “But tell me what has happened. Walter simply said ‘Transferred to higher court,’ which we agreed was to mean, ‘Committed for trial.’ Has the defence failed? And where is Reuben?”

“The defence is reserved. Dr. Thorndyke considered it almost certain that the case would be sent for trial, and that being so, decided that it was essential to keep the prosecution in the dark as to the line of defence. You see, if the police knew what the defence was to be they could revise their own plans accordingly.”

“I see that,” said she dejectedly, “but I am dreadfully disappointed. I had hoped that Dr. Thorndyke would get the case dismissed. What has happened to Reuben?”

This was the question that I had dreaded, and now that I had to answer it I cleared my throat and bent my gaze nervously on the floor.

“The magistrate refused bail,” I said after an uncomfortable pause.

“Well?”

“Consequently Reuben has been—er—detained in custody.”

“You don’t mean to say that they have sent him to prison?” she exclaimed breathlessly.

“No; Reuben has not been committed for trial,” I said. “But in prison?”

“Yes,” I was forced to admit; “in Holloway prison.”

She looked me stonily in the face for some seconds, pale and wide-eyed, but silent; then, with a sudden catch in her breath, she turned away, and, grasping the edge of the mantel-shelf, laid her head upon her arm and burst into a passion of sobbing.

Now I am not, in general, an emotional man, nor even especially impulsive; but neither am I a stock or a stone or an effigy of wood; which I most surely must have been if I could have looked without being deeply moved on the grief, so natural and unselfish, of this strong, brave, loyal-hearted woman. In effect, I moved to her side and, gently taking in mine the hand that hung down, murmured some incoherent words of consolation in a particularly husky voice.

Presently she recovered herself somewhat and softly withdrew her hand, as she turned towards me drying her eyes.

“You must forgive me for distressing you, as I fear I have,” she said; “for you are so kind, and I feel that you are really my friend and Reuben’s.”

“I am indeed, dear Miss Gibson,” I replied, “and so, I assure you, is my colleague.”

“I am sure of it,” she rejoined. “But I was so unprepared for this—I cannot say why, excepting that I trusted so entirely in Dr. Thorndyke—and it is so horrible and, above all, so dreadfully suggestive of what may happen. Up to now the whole thing has seemed like a nightmare—terrifying, but yet unreal. But now that he is actually in prison, it has suddenly become a dreadful reality and I am overwhelmed with terror. Oh! poor boy! What will become of him? For pity’s sake, Dr. Jervis, tell me what is going to happen.”
What could I do? I had heard Thorndyke's words of encouragement to Reuben and knew my colleague well enough to feel sure that he meant all he had said. Doubtless my proper course would have been to keep my own counsel and put Miss Gibson off with cautious ambiguities. But I could not; she was worthy of more confidence than that.

“You must not be unduly alarmed about the future,” I said. “I have it from Dr. Thorndyke that he is convinced of Reuben's innocence, and is hopeful of being able to make it clear to the world. But I did not have this to repeat,” I added, with a slight qualm of conscience.

“I know,” she said softly, “and I thank you from my heart.”

“And as to this present misfortune,” I continued, “you must not let it distress you too much. Try to think of it as of a surgical operation, which is a dreadful thing in itself, but is accepted in lieu of something which is immeasurably more dreadful.”

“I will try to do as you tell me,” she answered meekly; “but it is so shocking to think of a cultivated gentleman like Reuben, herded with common thieves and murderers, and locked in a cage like some wild animal. Think of the ignominy and degradation!”

“There is no ignominy in being wrongly accused,” I said—a little guiltily, I must own, for Thorndyke's words came back to me with all their force. But regardless of this I went on: “An acquittal will restore him to his position with an unstained character, and nothing but the recollection of a passing inconvenience to look back upon.”

She gave her eyes a final wipe, and resolutely put away her handkerchief.

“You have given me back my courage,” she said, “and chased away my terror. I cannot tell you how I feel your goodness, nor have I any thank-offering to make, except the promise to be brave and patient henceforth, and trust in you entirely.”

She said this with such a grateful smile, and looked withal so sweet and womanly that I was seized with an overpowering impulse to take her in my arms. Instead of this I said with conscious feebleness: “I am more than thankful to have been able to give you any encouragement—which you must remember comes from me second-hand, after all. It is to Dr. Thorndyke that we all look for ultimate deliverance.”

“I know. But it is you who came to comfort me in my trouble, so, you see, the honours are divided—and not divided quite equally, I fear, for women are unreasoning creatures, as, no doubt, your experience has informed you. I think I hear my aunt's voice, so you had better escape before your retreat is cut off. But before you go, you must tell me how and when I can see Reuben. I want to see him at the earliest possible moment. Poor fellow! He must not be allowed to feel that his friends have forgotten him even for a single instant.”

“You can see him to-morrow, if you like,” I said; and, casting my good resolutions to the winds, I added: “I shall be going to see him myself, and perhaps Dr. Thorndyke will go.”

“Would you let me call at the Temple and go with you? Should I be much in the way? It is rather an alarming thing to go to a prison alone.”

“It is not to be thought of,” I answered. “If you will call at the Temple—it is on the way—we can drive to Holloway together. I suppose you are resolved to go? It will be rather unpleasant, as you are probably aware.”

“I am quite resolved. What time shall I come to the Temple?”

“About two o'clock, if that will suit you.”

“Very well. I will be punctual; and now you must go or you will be caught.”

She pushed me gently towards the door and, holding out her hand, said—

“I haven’t thanked you half enough and I never can. Good-bye!”

She was gone, and I stood alone in the street, up which yellowish wreaths of fog were beginning to roll. It had been quite clear and bright when I entered the house, but now the sky was settling down into a colourless grey, the light was failing and the houses dwindling into dim, unreal shapes that vanished at half their height. Nevertheless I stepped out briskly and strode along at a good pace, as a young man is apt to do when his mind is in somewhat of a ferment. In truth, I had a good deal to occupy my thoughts and, as will often happen both to young men and old, those matters that bore most directly upon my own life and prospects were the first to receive attention.

What sort of relations were growing up between Juliet Gibson and me? And what was my position? As to hers, it seemed plain enough; she was wrapped up in Reuben Hornby and I was her very good friend because I was his. But for myself, there was no disguising the fact that I was beginning to take an interest in her that boded ill for my peace of mind.

Never had I met a woman who so entirely realised my conception of what a woman should be, nor one who exercised so great a charm over me. Her strength and dignity, her softness and dependency, to say nothing of her beauty, fitted her with the necessary weapons for my complete and utter subjugation. And utterly subjugated I was—there was no use in denying the fact, even though I realised already that the time would presently come when she would want me no more and there would remain no remedy for me but to go away and try to forget her.

But was I acting as a man of honour? To this I felt I could fairly answer “yes,” for I was but doing my duty, and could hardly act differently if I wished to. Besides, I was jeopardising no one's happiness but my own, and a man may do as he
pleases with his own happiness. No; even Thorndyke could not accuse me of dishonourable conduct.

Presently my thoughts took a fresh turn and I began to reflect upon what I had heard concerning Mr. Hornby. Here was a startling development, indeed, and I wondered what difference it would make in Thorndyke’s hypothesis of the crime. What his theory was I had never been able to guess, but as I walked along through the thickening fog I tried to fit this new fact into our collection of data and determine its bearings and significance.

In this, for a time, I failed utterly. The red thumb-mark filled my field of vision to the exclusion of all else. To me, as to everyone else but Thorndyke, this fact was final and pointed to a conclusion that was unanswerable. But as I turned the story of the crime over and over, there came to me presently an idea that set in motion a new and very startling train of thought.

Could Mr. Hornby himself be the thief? His failure appeared sudden to the outside world, but he must have seen difficulties coming. There, indeed, was the thumb-mark on the leaf which he had torn from his pocket-block. Yes! but who had seen him tear it off? No one. The fact rested on his bare statement.

But the thumb-mark? Well, it was possible (though unlikely)—still possible—that the mark might have been made accidentally on some previous occasion and forgotten by Reuben, or even unnoticed. Mr. Hornby had seen the “Thumbograph,” in fact his own mark was in it, and so would have had his attention directed to the importance of fingerprints in identification. He might have kept the marked paper for future use, and, on the occasion of the robbery, pencilled a dated inscription on it, and slipped it into the safe as a sure means of diverting suspicion. All this was improbable in the highest degree, but then so was every other explanation of the crime; and as to the unspeakable baseness of the deed, what action is too base for a gambler in difficulties?

I was so much excited and elated by my own ingenuity in having formed an intelligible and practicable theory of the crime, that I was now impatient to reach home that I might impart my news to Thorndyke and see how they affected him. But as I approached the centre of the town the fog grew so dense that all my attention was needed to enable me to thread my way safely through the traffic; while the strange, deceptive aspect that it lent to familiar objects and the obliteration of landmarks made my progress so slow that it was already past six o’clock when I felt my way down Middle Temple Lane and crept through Crown Office Row towards my colleague’s chambers.

On the doorstep I found Polton peering with anxious face into the blank expanse of yellow vapour.

“You can’t keep your time to the minute, sir,” I said, “Detained by the fog, I expect. It must be pretty thick in the Borough.”

(I may mention that, to Polton, Thorndyke was The Doctor. Other inferior creatures there were, indeed, to whom the title of “doctor” in a way, appertained; but they were of no account in Polton’s eyes. Surnames were good enough for them.)

“Yes, it must be,” I replied, “judging by the condition of the Strand.”

I entered and ascended the stairs, glad enough of the prospect of a warm and well-lighted room after my comfortless groping in the murky streets, and Polton, with a final glance up and down the walk reluctantly followed.

“You would like some tea, sir, I expect?” said he, as he let me in (though I had a key of my own now).

I thought I should, and he accordingly set about the preparations in his deft methodical way, but with an air of abstraction that was unusual with him.

“The Doctor said he should be home by five,” he remarked, as he laid the tea-pot on the tray.

“Then he is a defaulter,” I answered. “We shall have to water his tea.”

“A wonderful punctual man, sir, is the Doctor,” pursued Polton. “Keeps his time to the minute, as a rule, he does.”

“You can’t keep your time to a minute in a ‘London Particular,’” I said a little impatiently, for I wished to be alone that I might think over matters, and Polton’s nervous flutterings irritated me somewhat. He was almost as bad as a female housekeeper.

The little man evidently perceived my state of mind, for he stole away silently, leaving me rather penitent and ashamed, and, as I presently discovered on looking out of the window, resumed his vigil on the doorstep. From this coign of vantage he returned after a time to take away the tea-things; and thereafter, though it was now dark as well as foggy, I could hear him softly flitting up and down the stairs with a gloomy stealthiness that at length reduced me to a condition as nervously apprehensive as his own.
VIII. — A SUSPICIOUS ACCIDENT

THE Temple clock had announced in soft and confidential tones that it was a quarter to seven, in which statement it was stoutly supported by its colleague on our mantelpiece, and still there was no sign of Thorneidke. It was really a little strange, for he was the soul of punctuality, and moreover, his engagements were of such a kind as rendered punctuality possible. I was burning with impatience to impart my news to him, and this fact, together with the ghostly proceedings of Polton, worked me up to a state of nervous tension that rendered either rest or thought equally impossible. I looked out of the window at the lamp below, glaring redly through the fog, and then, opening the door, went out on to the landing to listen.

At this moment Polton made a silent appearance on the stairs leading from the laboratory, giving me quite a start; and I was about to retire into the room when my ear caught the tinkle of a hansom approaching from Paper Buildings.

The vehicle drew nearer, and at length stopped opposite the house, on which Polton slid down the stairs with the agility of a harlequin. A few moments later I heard his voice ascending from the hall—

"I do hope, sir, you’re not much hurt?"

I ran down the stairs and met Thorneidke coming up slowly with his right hand on Polton’s shoulder. His clothes were muddy, his left arm was in a sling, and a black handkerchief under his hat evidently concealed a bandage.

"I am not really hurt at all," Thorneidke replied cheerily, "though very disreputable to look at. Just came a cropper in the mud, Jervis," he added, as he noted my dismayed expression. "Dinner and a clothes-brush are what I chiefly need." Nevertheless, he looked very pale and shaken when he came into the light on the landing, and he sank into his easy-chair in the limp manner of a man either very weak or very fatigued.

"How did it happen?" I asked when Polton had crept away on tip-toe to make ready for dinner.

Thorneidke looked round to make sure that his henchman had departed, and said—

"A queer affair, Jervis; a very odd affair indeed. I was coming up from the Borough, picking my way mightily carefully across the road on account of the greasy, slippery mud, and had just reached the foot of London Bridge when I heard a heavy lorry coming down the slope a good deal too fast, considering that it was impossible to see more than a dozen yards ahead, and I stopped on the kerb to see it safely past. Just as the horses emerged from the fog, a man came up behind and lurched violently against me and, strangely enough, at the same moment passed his foot in front of mine. Of course I went sprawling into the road right in front of the lorry. The horses came stamping and sliding straight on to me, and, before I could wriggle out of the way, the hoof of one of them smashed in my hat—that was a new one that I came home in—and half-stunned me. Then the near wheel struck my head, making a dirty little scalp wound, and pinned down my sleeve so that I couldn’t pull away my arm, which is consequently barked all the way down. It was a mighty near thing, Jervis; another inch or two and I should have been rolled out as flat as a starfish."

"What became of the man?" I asked, wishing I could have had a brief interview with him.

"Lost to sight though to memory dear: he was off like a lamplighter. An alcoholic apple-woman picked me up and escorted me back to the hospital. It must have been a touching spectacle," he added, with a dry smile at the recollection.

"And I suppose they kept you there for a time to recover?"

"Yes; I went into dry dock in the O. P. room, and then old Langdale insisted on my lying down for an hour or so in case any symptoms of concussion should appear. But I was only a trifle shaken and confused. Still, it was a queer affair."

"You mean the man pushing you down in that way?"

"Yes; I can’t make out how his foot got in front of mine."

"You don’t think it was intentional, surely?" I said.

"No, of course not," he replied, but without much conviction, as it seemed to me; and I was about to pursue the matter when Polton reappeared, and my friend abruptly changed the subject.

After dinner I recounted my conversation with Walter Hornby, watching my colleague’s face with some eagerness to see what effect this new information would produce on him. The result was, on the whole, disappointing. He was interested, keenly interested, but showed no symptoms of excitement.

"So John Hornby has been plunging in mines, eh?" he said, when I had finished. "He ought to know better at his age. Did you learn how long he had been in difficulties?"

"No. But it can hardly have been quite sudden and unforeseen."

"I should think not," Thorneidke agreed. "A sudden slump often proves disastrous to the regular Stock Exchange gambler who is paying differences on large quantities of unpaid-for stock. But it looks as if Hornby had actually bought and paid for these mines, treating them as investments rather than speculations, in which case the depreciation would not have affected him in the same way. It would be interesting to know for certain."

"It might have a considerable bearing on the present case, might it not?"
“Undoubtedly,” said Thorndyke. “It might bear on the case in more ways than one. But you have some special point in your mind, I think.”

“Yes. I was thinking that if these embarrassments had been growing up gradually for some time, they might have already assumed an acute form at the time of the robbery.”

“That is well considered,” said my colleague. “But what is the special bearing on the case supposing it was so?”

“On the supposition,” I replied, “that Mr. Hornby was in actual pecuniary difficulties at the date of the robbery, it seems to me possible to construct a hypothesis as to the identity of the robber.”

“I should like to hear that hypothesis stated,” said Thorndyke, rousing himself and regarding me with lively interest.

“It is a highly improbable one.” I began with some natural shyness at the idea of airing my wits before this master of inductive method; “in fact, it is almost fantastic.”

“Never mind that,” said he. “A sound thinker gives equal consideration to the probable and the improbable.”

Thus encouraged, I proceeded to set forth the theory of the crime as it had occurred to me on my way home in the fog, and I was gratified to observe the close attention with which Thorndyke listened, and his little nods of approval at each point that I made.

When I had finished, he remained silent for some time, looking thoughtfully into the fire and evidently considering how my theory and the new facts on which it was based would fit in with the rest of the data. At length he spoke, without, however, removing his eyes from the red embers—

“This theory of yours, Jervis, does great credit to your ingenuity. We may disregard the improbability, seeing that the alternative theories are almost equally improbable, and the fact that emerges, and that gratifies me more than I can tell you, is that you are gifted with enough scientific imagination to construct a possible train of events. Indeed, the improbability—combined, of course, with possibility—really adds to the achievement, for the dullest mind can perceive the obvious—as, for instance, the importance of a finger-print. You have really done a great thing, and I congratulate you; for you have emancipated yourself, at least to some extent, from the great finger-print obsession, which has possessed the legal mind ever since Galton published his epoch-making monograph. In that work I remember he states that a finger-print affords evidence requiring no corroboration—a most dangerous and misleading statement which has been fastened upon eagerly by the police, who have naturally been delighted at obtaining a sort of magic touchstone by which they are saved the labour of investigation. But there is no such thing as a single fact that ‘affords evidence requiring no corroboration.’ As well might one expect to make a syllogism with a single premise.”

“I suppose they would hardly go so far as that,” I said, laughing.

“No,” he admitted. “But the kind of syllogism that they do make is this—

“The crime was committed by the person who made this finger-print.

“But John Smith is the person who made the finger-print.

“Therefore the crime was committed by John Smith.”

“Well, that is a perfectly good syllogism, isn’t it?” I asked.

“Perfectly,” he replied. “But, you see, it begs the whole question, which is, ‘Was the crime committed by the person who made this finger-print?’ That is where the corroboration is required.”

“That practically leaves the case to be investigated without reference to the finger-print, which thus becomes of no importance.”

“Not at all,” rejoined Thorndyke; “the finger-print is a most valuable clue as long as its evidential value is not exaggerated. Take our present case, for instance. Without the thumb-print, the robbery might have been committed by anybody; there is no clue whatever. But the existence of the thumb-print narrows the inquiry down to Reuben or some person having access to his finger-prints.”

“Yes, I see. Then you consider my theory of John Hornby as the perpetrator of the robbery as quite a tenable one?”

“Quite,” replied Thorndyke. “I have entertained it from the first; and the new facts that you have gathered increase its probability. You remember I said that four hypotheses were possible: that the robbery was committed either by Reuben, by Walter, by John Hornby, or by some other person. Now, putting aside the ‘some other person’ for consideration only if the first three hypotheses fail, we have left, Reuben, Walter, and John. But if we leave the thumb-print out of the question, the probabilities evidently point to John Hornby, since he, admittedly, had access to the diamonds, whereas there is nothing to show that the others had. The thumb-print, however, transfers the suspicion to Reuben; but yet, as your theory makes evident, it does not completely clear John Hornby. As the case stands, the balance of probabilities may be stated thus: John Hornby undoubtedly had access to the diamonds, and therefore might have stolen them. But if the thumb-mark was made after he closed the safe and before he opened it again, some other person must have had access to them, and was probably the thief.

“The thumb-mark is that of Reuben Hornby, a fact that establishes a prima facie probability that he stole the diamonds. But there is no evidence that he had access to them, and if he had not, he could not have made the thumb-mark in the
manner and at the time stated.

“But John Hornby may have had access to the previously-made thumb-mark of Reuben, and may possibly have obtained it; in which case it is almost certainly the thief.

“As to Walter Hornby, he may have had the means of obtaining Reuben’s thumb-mark; but there is no evidence that he had access either to the diamonds or to Mr. Hornby’s memorandum block. The prima facie probabilities in his case, therefore, are very slight.”

“The actual points at issue, then,” I said, “are, whether Reuben had any means of opening the safe, and whether Mr. Hornby ever did actually have the opportunity of obtaining Reuben’s thumb-mark in blood on his memorandum block.”

“Yes,” replied Thorndyke. “Those are the points—with some others—and they are likely to remain unsettled. Reuben’s rooms have been searched by the police, who failed to find any skeleton or duplicate keys; but this proves nothing, as he would probably have made away with them when he heard of the thumb-mark being found. As to the other matter, I have asked Reuben, and he has no recollection of ever having made a thumb-mark in blood. So there the matter rests.”

“And what about Mr. Hornby’s liability for the diamonds?”

“I think we may dismiss that,” answered Thorndyke. “He had undertaken no liability and there was no negligence. He would not be liable at law.”

After my colleague retired, which he did quite early, I sat for a long time pondering upon this singular case in which I found myself involved. And the more I thought about it the more puzzled I became. If Thorndyke had no more satisfactory explanation to offer than that which he had given me this evening, the defence was hopeless, for the court was not likely to accept his estimate of the evidential value of finger-prints. Yet he had given Reuben something like a positive assurance that there would be an adequate defence, and had expressed his own positive conviction of the accused man’s innocence. But Thorndyke was not a man to reach such a conviction through merely sentimental considerations. The inevitable conclusion was that he had something up his sleeve—that he had gained possession of some facts that had escaped my observation; and when I had reached this point I knocked out my pipe and betook myself to bed.

---

**IX. — THE PRISONER**

ON the following morning, as I emerged from my room, I met Polton coming up with a tray (our bedrooms were on the attic floor above the laboratory and workshop), and I accordingly followed him into my friend’s chamber.

“I shan’t go out to-day,” said Thorndyke, “though I shall come down presently. It is very inconvenient, but one must accept the inevitable. I have had a knock on the head, and, although I feel none the worse, I must take the proper precautions—rest and a low diet—until I see that no results are going to follow. You can attend to the scalp wound and send round the necessary letters, can’t you?”

I expressed my willingness to do all that was required and applauded my friend’s self-control and good sense; indeed, I could not help contrasting the conduct of this busy, indefatigable man, cheerfully resigning himself to most distasteful inaction, with the fussy behaviour of the ordinary patient who, with nothing of importance to do, can hardly be prevailed upon to rest, no matter how urgent the necessity. Accordingly, I breakfasted alone, and spent the morning in writing and despatching letters to the various persons who were expecting visits from my colleague.

Shortly after lunch (a very spare one, by the way, for Polton appeared to include me in the scheme of reduced diet) my expectant ear caught the tinkle of a hansom approaching Crown Office Row.

“Here comes your fair companion,” said Thorndyke, whom I had acquainted with my arrangements, “Tell Hornby, from me, to keep up his courage, and, for yourself, bear my warning in mind. I should be sorry indeed if you ever had cause to regret that you had rendered me the very valuable services for which I am now indebted to you. Good-bye; don’t keep her waiting.”

I ran down the stairs and came out of the entry just as the cabman had pulled up and flung open the doors.

“Holloway Prison—main entrance,” I said, as I stepped up on to the footboard.

“There ain’t no back door there, sir,” the man responded, with a grin; and I was glad that neither the answer nor the grin was conveyed to my fellow-passenger.

“You are very punctual, Miss Gibson,” I said. “It is not half-past one yet.”

“Yes; I thought I should like to get there by two, so as to have as long a time with him as is possible without shortening your interview.”

I looked at my companion critically. She was dressed with rather more than her usual care, and looked, in fact, a very fine lady indeed. This circumstance, which I noted at first with surprise and then with decided approbation, caused me some inward discomfort, for I had in my mind a very distinct and highly disagreeable picture of the visiting arrangements at a local prison in one of the provinces, at which I had acted temporarily as medical officer.

“I suppose,” I said at length, “it is of no use for me to re-open the question of the advisability of this visit on your part?”
“Not the least,” she replied resolutely, “though I understand and appreciate your motive in wishing to do so.”

“Then,” said I, “if you are really decided, it will be as well for me to prepare you for the ordeal. I am afraid it will give you a terrible shock.”

“Indeed?” said she. “Is it so bad? Tell me what it will be like.”

“In the first place,” I replied, “you must keep in your mind the purpose of a prison like Holloway. We are going to see an innocent man—a cultivated and honourable gentleman. But the ordinary inmates of Holloway are not innocent men; for the most part, the remand cases on the male side are professional criminals, while the women are either petty offenders or chronic inebriates. Most of them are regular customers at the prison—such is the idiotic state of the law—who come into the reception-room like travellers entering a familiar hostelry, address the prison officers by name and demand the usual privileges and extra comforts—the ‘drunks,’ for instance, generally ask for a dose of bromide to steady their nerves and a light in the cell to keep away the horrors. And such being the character of the inmates, their friends who visit them are naturally of the same type—the lowest outpourings of the slums; and it is not surprising to find that the arrangements of the prison are made to fit its ordinary inmates. The innocent man is a negligible quantity, and no arrangements are made for him or his visitors.”

“But shall we not be taken to Reuben’s cell?” asked Miss Gibson.

“Bless you! no,” I answered; and, determined to give her every inducement to change her mind, I continued: “I will describe the procedure as I have seen it—and a very dreadful and shocking sight I found it, I can tell you. It was while I was acting as a prison doctor in the Midlands that I had this experience. I was going my round one morning when, passing along a passage, I became aware of a strange, muffled roar from the other side of the wall.

“What is that noise?” I asked the warden who was with me.

“Prisoners seeing their friends,’ he answered. ‘Like to have a look at them, sir?’

“He unlocked a small door and, as he threw it open, the distant, muffled sound swelled into a deafening roar. I passed through the door and found myself in a narrow alley at one end of which a warden was sitting. The sides of the alley were formed by two immense cages with stout wire bars, one for the prisoners and the other for the visitors; and each cage was lined with faces and hands, all in incessant movement, the faces mouthing and grimacing, and the hands clawing restlessly at the bars. The uproar was so terrific that no single voice could be distinguished, though every one present was shouting his loudest to make himself heard above the universal din. The result was a very strange and horrid illusion, for it seemed as if no one was speaking at all, but that the noise came from outside, and that each one of the faces—low, vicious faces, mostly—was silently grimacing and gibbering, snapping its jaws and glaring furiously at the occupants of the opposite cage. It was a frightful spectacle. I could think of nothing but the monkey-house at the Zoo. It seemed as if one ought to walk up the alley and offer nuts and pieces of paper to be torn to pieces.”

“Horrible!” exclaimed Miss Gibson. “And do you mean to say that we shall be turned loose into one of these cages with a herd of other visitors?”

“No. You are not turned loose anywhere in a prison. The arrangement is this: each cage is divided by partitions into a number of small boxes or apartments, which are numbered. The prisoner is locked in one box and his visitor in the corresponding box opposite. They are thus confronted, with the width of the alley between them; they can see one another and talk but cannot pass any forbidden articles across—a very necessary precaution, I need hardly say.”

“Yes, I suppose it is necessary, but it is horrible for decent people. Surely they ought to be able to discriminate.”

“Why not give it up and let me take a message to Reuben? He would understand and be thankful to me for dissuading you.”

“No, no,” she said quickly; “the more repulsive it is the greater the necessity for me to go. He must not be allowed to think that a trifling inconvenience or indignity is enough to scare his friends away. What building is that ahead?”

We had just swung round from Caledonian Road into a quiet and prosperous-looking suburban street, at the end of which rose the tower of a castellated building.

“That is the prison,” I replied. “We are looking at it from the most advantageous point of view; seen from the back, and especially from the inside, it is a good deal less attractive.”

Nothing more was said until the cab drove into the courtyard and set us down outside the great front gates. Having directed the cabman to wait for us, I rang the bell and we were speedily admitted through a wicket (which was immediately closed and locked) into a covered court closed in by a second gate, through the bars of which we could see across an inner courtyard to the actual entrance to the prison. Here, while the necessary formalities were gone through, we found ourselves part of a numerous and very motley company, for a considerable assemblage of the prisoners’ friends was awaiting the moment of admission. I noticed that my companion was observing our fellow-visitors with a kind of horrified curiosity, which she strove, however, and not unsuccessfully, to conceal; and certainly the appearance of the majority furnished eloquent testimony to the failure of crime as a means of worldly advancement. Their present position was productive of very varied emotions; some were silent and evidently stricken with grief; a larger number were valuable and excited, while a considerable proportion were quite cheerful and even inclined to be facetious.

At length the great iron gate was unlocked and our party taken in charge by a warden, who conducted us to that part of
the building known as “the wing”; and, in the course of our progress, I could not help observing the profound impression made upon my companion by the circumstance that every door had to be unlocked to admit us and was locked again as soon as we had passed through.

“It seems to me,” I said, as we neared our destination, “that you had better let me see Reuben first; I have not much to say to him and shall not keep you waiting long.”

“Well,” I answered, “I think you may be a little upset by the interview, and I should like to see you into your cab as soon as possible afterwards.”

“Yes,” she said; “perhaps you are right, and it is kind of you to be so thoughtful on my account.”

A minute later, accordingly, I found myself shut into a narrow box, like one of those which considerate pawnbrokers provide for their more diffident clients, and in a similar, but more intense, degree, pervaded by a subtle odour of uncleanness. The woodwork was polished to an unctuous smoothness by the friction of numberless dirty hands and soiled garments, and the general appearance—taken in at a glance as I entered—was such as to cause me to thrust my hands into my pockets and studiously avoid contact with any part of the structure but the floor. The end of the box opposite the door was closed in by a strong grating of wire—excepting the lower three feet, which was of wood—and looking through this, I perceived, behind a second grating, Reuben Hornby, standing in a similar attitude to my own. He was dressed in his usual clothes and with his customary neatness, but his face was unshaven and he wore, suspended from a button-hole, a circular label bearing the characters “B.34”; and these two changes in his exterior carried with them a suggestiveness as subtle as it was unpleasant, making me more than ever regretful that Miss Gibson had insisted on coming.

“It is exceedingly good of you, Dr. Jervis, to come and see me,” he said heartily, making himself heard quite easily, to my surprise, above the hubbub of the adjoining boxes; “but I didn’t expect you here. I was told I could see my legal advisers in the solicitor’s box.”

“So you could,” I answered. “But I came here by choice because I have brought Miss Gibson with me.”

“I am sorry for that,” he rejoined, with evident disapproval; “she oughtn’t to have come among these riff-raff.”

“I told her so, and that you wouldn’t like it, but she insisted.”

“I know,” said Reuben. “That’s the worst of women—they will make a beastly fuss and sacrifice themselves when nobody wants them to. But I mustn’t be ungrateful; she means it kindly, and she’s a deuced good sort, is Juliet.”

“She is indeed,” I exclaimed, not a little disgusted at his cool, unappreciative tone; “a most noble-hearted girl, and her devotion to you is positively heroic.”

The faintest suspicion of a smile appeared on the face seen through the double grating; on which I felt that I could have pulled his nose with pleasure—only that a pair of tongs of special construction would have been required for the purpose.

“Yes,” he answered calmly, “we have always been very good friends.”

A rejoinder of the most extreme acidity was on my lips. Damn the fellow! What did he mean by speaking in that supercilious tone of the loveliest and sweetest woman in the world? But, after all, one cannot trample on a poor devil locked up in a jail on a false charge, no matter how great may be the provocation. I drew a deep breath, and, having recovered myself, outwardly at least, said—

“I hope you don’t find the conditions here too intolerable?”

“Oh, no,” he answered. “It’s beastly unpleasant, of course, but it might easily be worse. I don’t mind if it’s only for a week or two; and I am really encouraged by what Dr. Thorndyke said. I hope he wasn’t being merely soothing.”

“You may take it that he was not. What he said, I am sure he meant. Of course, you know I am not in his confidence—nobody is—but I gather that he is satisfied with the defence he is preparing.”

“If he is satisfied, I am,” said Reuben, “and, in any case, I shall owe him an immense debt of gratitude for having stood by me and believed in me when all the world—except my aunt and Juliet—had condemned me.”

He then went on to give me a few particulars of his prison life, and when he had chatted for a quarter of an hour or so, I took my leave to make way for Miss Gibson.

Her interview with him was not as long as I had expected, though, to be sure, the conditions were not very favourable either for the exchange of confidences or for utterances of a sentimental character. The consciousness that one’s conversation could be overheard by the occupants of adjacent boxes destroyed all sense of privacy, to say nothing of the disturbing influence of the warder in the alley-way.

When she rejoined me, her manner was abstracted and very depressed, a circumstance that gave me considerable food for reflection as we made our way in silence towards the main entrance. Had she found Reuben as cool and matter-of-fact as I had? He was assuredly a very calm and self-possessed lover, and it was conceivable that his reception of the girl, strung up, as she was, to an acute pitch of emotion, might have been somewhat in the nature of an anticlimax. And then, was it possible that the feeling was on her side only? Could it be that the priceless pearl of her love was cast before—I was tempted to use the colloquial singular and call him an “unappreciative swine!” The thing was almost unthinkable to me,
and yet I was tempted to dwell upon it; for when a man is in love—and I could no longer disguise my condition from myself—he is inclined to be humble and to gather up thankfully the treasure that is rejected of another.

I was brought up short in these reflections by the clank of the lock in the great iron gate. We entered together the gloomy vestibule, and a moment later were let out through the wicket into the courtyard; and as the lock clicked behind us, we gave a simultaneous sigh of relief to find ourselves outside the precincts of the prison, beyond the domain of bolts and bars.

I had settled Miss Gibson in the cab and given her address to the driver, when I noticed her looking at me, as I thought, somewhat wistfully.

“Can’t I put you down somewhere?” she said, in response to a half-questioning glance from me.

I seized the opportunity with thankfulness and replied—

“You might set me down at King’s Cross if it is not delaying you;” and giving the word to the cabman, I took my place by her side as the cab started and a black-painted prison van turned into the courtyard with its freight of squalid misery.

“I don’t think Reuben was very pleased to see me,” Miss Gibson remarked presently, “but I shall come again all the same. It is a duty I owe both to him and to myself.”

I felt that I ought to endeavour to dissuade her, but the reflection that her visits must almost of necessity involve my companionship, enfeebled my will. I was fast approaching a state of infatuation.

“I was so thankful,” she continued, “that you prepared me. It was a horrible experience to see the poor fellow caged like a wild beast, with that dreadful label hanging from his coat; but it would have been overwhelming if I had not known what to expect.”

As we proceeded, her spirits revived somewhat, a circumstance that she graciously ascribed to the enlivening influence of my society; and I then told her of the mishap that had befallen my colleague.

“What a terrible thing!” she exclaimed, with evidently unaffected concern. “It is the merest chance that he was not killed on the spot. Is he much hurt? And would he mind, do you think, if I called to inquire after him?”

I said that I was sure he would be delighted (being, as a matter of fact, entirely indifferent as to his sentiments on the subject in my delight at the proposal), and when I stepped down from the cab at King’s Cross to pursue my way homewards, there already opened out before me the prospect of the renewal of this bitter-sweet and all too dangerous companionship on the morrow.

X. — POLTON IS MYSTIFIED

A COUPLE of days sufficed to prove that Thorndyke’s mishap was not to be productive of any permanent ill consequences; his wounds progressed favourably and he was able to resume his ordinary avocations.

Miss Gibson’s visit—but why should I speak of her in these formal terms? To me, when I thought of her, which I did only too often, she was Juliet, with perhaps an adjective thrown in; and as Juliet I shall henceforth speak of her (but without the adjective) in this narrative, wherein nothing has been kept back from the reader—Juliet’s visit, then, had been a great success, for my colleague was really pleased by the attention, and displayed a quiet geniality that filled our visitor with delight.

He talked a good deal of Reuben, and I could see that he was endeavouring to settle in his own mind the vexed question of her relations with and sentiments towards our unfortunate client; but what conclusions he arrived at I was unable to discover, for he was by no means communicative after she had left. Nor was there any repetition of the visit—greatly to my regret—since, as I have said, he was able, in a day or two, to resume his ordinary mode of life.

The first evidence I had of his renewed activity appeared when I returned to the chambers at about eleven o’clock in the morning, to find Polton hovering dejectedly about the sitting-room, apparently perpetrating as near an approach to a “spring clean” as could be permitted in a bachelor establishment.

“Hallo, Polton!” I exclaimed, “have you contrived to tear yourself away from the laboratory for an hour or two?”

“No, sir,” he answered gloomily. “The laboratory has torn itself away from me.”

“What do you mean?” I asked.

“The Doctor has shut himself in and locked the door, and he says I am not to disturb him. It will be a cold lunch to-day.”

“What is he doing in there?” I inquired.

“Ah!” said Polton, “that’s just what I should like to know. I’m fair eaten up with curiosity. He is making some experiments in connection with some of his cases, and when the Doctor locks himself in to make experiments, something interesting generally follows. I should like to know what it is this time.”

“I suppose there is a keyhole in the laboratory door?” I suggested, with a grin.

“Sir!” he exclaimed indignantly. “Dr. Jervis, I am surprised at you.” Then, perceiving my facetious intent, he smiled also
and added: “But there is a keyhole if you’d like to try it, though I’ll wager the Doctor would see more of you than you would of him.”

“You are mighty secret about your doings, you and the Doctor,” I said.

“Yes,” he answered. “You see, it’s a queer trade this of the Doctor’s, and there are some queer secrets in it. Now, for instance, what do you make of this?”

He produced from his pocket a leather case, whence he took a piece of paper which he handed to me. On it was a neatly executed drawing of what looked like one of a set of chessmen, with the dimensions written on the margin.

“It looks like a pawn—one of the Staunton pattern,” I said.

“Just what I thought; but it isn’t. I’ve got to make twenty-four of them, and what the Doctor is going to do with them fairly beats me.”

“Perhaps he has invented some new game,” I suggested facetiously.

“He is always inventing new games and playing them mostly in courts of law, and then the other players generally lose. But this is a puzzler, and no mistake. Twenty-four of these to be turned up in the best-seasoned boxwood! What can they be for? Something to do with the experiments he is carrying on upstairs at this very moment, I expect.” He shook his head, and, having carefully returned the drawing to his pocket-book, said, in a solemn tone—“Sir, there are times when the Doctor makes me fairly dance with curiosity. And this is one of them.”

Although not afflicted with a curiosity so acute as that of Polton, I found myself speculating at intervals on the nature of my colleague’s experiments and the purpose of the singular little objects which he had ordered to be made; but I was unacquainted with any of the cases on which he was engaged, excepting that of Reuben Hornby, and with the latter I was quite unable to connect a set of twenty-four boxwood chessmen. Moreover, on this day, I was to accompany Juliet on her second visit to Holloway, and that circumstance gave me abundant mental occupation of another kind.

At lunch, Thordyke was animated and talkative but not communicative. He “had some work in the laboratory that he must do himself,” he said, but gave no hint as to its nature; and as soon as our meal was finished, he returned to his labours, leaving me to pace up and down the walk, listening with ridiculous eagerness for the sound of the hansom that was to transport me to the regions of the blest, and—in incidentally—to Holloway Prison.

When I returned to the Temple, the sitting-room was empty and hideously neat, as the result of Polton’s spring-cleaning efforts. My colleague was evidently still at work in the laboratory, and, from the circumstance that the tea-things were set out on the table and a kettle of water placed in readiness on the gas-ring by the fireplace, I gathered that Polton also was full of business and anxious not to be disturbed.

Accordingly, I lit the gas and made my tea, enlivening my solitude by turning over in my mind the events of the afternoon.

Juliet had been charming—as she always was—frank, friendly and unaffectedly pleased to have my companionship. She evidently liked me and did not disguise the fact—why should she indeed?—but treated me with a freedom, almost affectionate, as though I had been a favourite brother; which was very delightful, and would have been more so if I could have accepted the relationship. As to her feelings towards me, I had not the slightest misgiving, and so my conscience was clear; for Juliet was as innocent as a child, with the innocence that belongs to the direct, straightforward nature that neither does evil itself nor looks for evil motives in others. For myself, I was past praying for. The thing was done and I must pay the price hereafter, content to reflect that I had trespassed against no one but myself. It was a miserable affair, and many a heartache did it promise me in the lonely days that were to come, when I should have said “good-bye” to the Temple and gone back to my old nomadic life; and yet I would not have had it changed if I could; would not have bartered the bitter-sweet memories for dull forgetfulness.

But other matters had transpired in the course of our drive than those that loomed so large to me in the egotism of my love. We had spoken of Mr. Hornby and his affairs, and from our talk there had emerged certain facts of no little moment to the inquiry on which I was engaged.

“Misfortunes are proverbially sociable,” Juliet had remarked, in reference to her adopted uncle. “As if this trouble about Reuben were not enough, there are worries in the city. Perhaps you have heard of them.”

I replied that Walter had mentioned the matter to me.

“Yes,” said Juliet rather viciously; “I am not quite clear as to what part that good gentleman has played in the matter. It has come out, quite accidentally, that he had a large holding in the mines himself, but he seems to have ‘cut his loss,’ as the phrase goes, and got out of them; though how he managed to pay such large differences is more than we can understand. We think he must have raised money somehow to do it.”

“Do you know when the mines began to depreciate?” I asked.

“Yes, it was quite a sudden affair—what Walter calls ‘a slump’—and it occurred only a few days before the robbery. Mr. Hornby was telling me about it only yesterday, and he recalled it to me by a ridiculous accident that happened on that day.”

“What was that?” I inquired.
“Why, I cut my finger and nearly fainted,” she answered, with a shamefaced little laugh. “It was rather a bad cut, you know, but I didn’t notice it until I found my hand covered with blood. Then I turned suddenly faint, and had to lie down on the hearthrug—it was in Mr. Hornby’s study, which I was tidying up at the time. Here I was found by Reuben, and a dreadful fright it gave him at first; and then he tore up his handkerchief to tie up the wounded finger, and you never saw such an awful mess as he got his hands in. He might have been arrested as a murderer, poor boy, from the condition he was in. It will make your professional gorge rise to learn that he fastened up the extemporised bandage with red tape, which he got from the writing table after rooting about among all the sacred papers in the most ruthless fashion.

“When he had gone I tried to put the things on the table straight again, and really you might have thought some horrible crime had been committed; the envelopes and papers were all smeared with blood and marked with the print of gory fingers. I remembered it afterwards, when Reuben’s thumb-mark was identified, and thought that perhaps one of the papers might have got into the safe by accident; but Mr. Hornby told me that was impossible; he tore the leaf off his memorandum block at the time when he put away the diamonds.”

Such was the gist of our conversation as the cab rattled through the streets on the way to the prison; and certainly it contained matter sufficiently important to draw away my thoughts from other subjects, more agreeable, but less relevant to the case. With a sudden remembrance of my duty, I drew forth my notebook, and was in the act of committing the statements to writing, when Thorndyke entered the room.

“Don’t let me interrupt you, Jervis,” said he. “I will make myself a cup of tea while you finish your writing, and then you shall exhibit the day’s catch and hang your nets out to dry.”

I was not long in finishing my notes, for I was in a fever of impatience to hear Thorndyke’s comments on my latest addition to our store of information. By the time the kettle was boiling my entries were completed, and I proceeded forthwith to retail to my colleague those extracts from my conversation with Juliet that I have just recorded.

He listened, as usual, with deep and critical attention.

“This is very interesting and important,” he said, when I had finished; “really, Jervis, you are a most invaluable coadjutor. It seems that information, which would be strictly withheld from the forbidding Jorkins, trickles freely and unasked into the ear of the genial Spenlow. Now, I suppose you regard your hypothesis as having received very substantial confirmation?”

“Certainly, I do.”

“And very justifiably. You see now how completely you were in the right when you allowed yourself to entertain this theory of the crime in spite of its apparent improbability. By the light of these new facts it has become quite a probable explanation of the whole affair, and if it could only be shown that Mr. Hornby’s memorandum block was among the papers on the table, it would rise to a high degree of probability. The obvious moral is, never disregard the improbable. By the way, it is odd that Reuben failed to recall this occurrence when I questioned him. Of course, the bloody finger-marks were not discovered until he had gone, but one would have expected him to recall the circumstance when I asked him, pointedly, if he had never left bloody finger-prints on any papers.”

“I must try to find out if Mr. Hornby’s memorandum block was on the table and among the marked papers,” I said.

“Yes, that would be wise,” he answered, “though I don’t suppose the information will be forthcoming.”

My colleague’s manner rather disappointed me. He had heard my report with the greatest attention, he had discussed it with animation, but yet he seemed to attach to the new and—as they appeared to me—highly important facts an interest that was academic rather than practical. Of course, his calmness might be assumed; but this did not seem likely, for John Thorndyke was far too sincere and dignified a character to cultivate in private life the artifices of the actor. To strangers, indeed, he presented habitually a calm and impassive exterior; but this was natural to him, and was but the outward sign of his even and judicial habit of mind.

No; there was no doubt that my startling news had left him unmoved, and this must be for one of two reasons: either he already knew all that I had told him (which was perfectly possible), or he had some other and better means of explaining the crime. I was turning over these two alternatives, not unobserved by my watchful colleague, when Polton entered the room; a broad grin was on his face, and a drawing-board, that he carried like a tray, bore twenty-four neatly turned boxwood pieces.

Thorndyke at once entered into the unspoken jest that beamed from the countenance of his subordinate.

“Here is Polton with a problem for you, Jervis,” he said. “He assumes that I have invented a new parlour game, and has been trying to work out the moves. Have you succeeded yet, Polton?”

“No, sir, I haven’t; but I suspect that one of the players will be a man in a wig and gown.”

“Perhaps you are right,” said Thorndyke; “but that doesn’t take you very far. Let us hear what Dr. Jervis has to say.”

“I can make nothing of them,” I answered. “Polton showed me the drawing this morning, and then was terrified lest he had committed a breach of confidence, and I have been trying ever since, without a glimmer of success, to guess what they can be for.”

“H’m,” grunted Thorndyke, as he sauntered up and down the room, teacup in hand, “to guess, eh? I like not that word
'guess' in the mouth of a man of science. What do you mean by a 'guess'?

His manner was wholly facetious, but I professed to take his question seriously, and replied—

"By a guess, I mean a conclusion arrived at without data."

"Impossible!" he exclaimed, with mock sternness. "Nobody but an utter fool arrives at a conclusion without data."

"Then I must revise my definition instantly," I rejoined. "Let us say that a guess is a conclusion drawn from insufficient facts."

"That is better," said he; "but perhaps it would be better still to say that a guess is a particular and definite conclusion deduced from facts which properly yield only a general and indefinite one. Let us take an instance," he continued. "Looking out of the window, I see a man walking round Paper Buildings. Now suppose I say, after the fashion of the inspired detective of the romances, 'That man is a stationmaster,' that would be a guess. The observed facts do not yield the conclusion, though they do warrant a conclusion less definite and more general."

"You'd have been right though, sir!" exclaimed Polton, who had stepped forward with me to examine the unconscious subject of the demonstration. "That gent used to be the stationmaster at Camberwell. I remember him well."

The little man was evidently greatly impressed.

"I happen to be right, you see," said Thorndyke; "but I might as easily have been wrong."

"You weren't though, sir," said Polton. "You spotted him at a glance."

In his admiration of the result he cared not a fig for the correctness of the means by which it had been attained.

"Now why do I suggest that he is a stationmaster?" pursued Thorndyke, disregarding his assistant's comment.

"I suppose you were looking at his feet," I answered. "I seem to have noticed that peculiar, splay-footed gait in stationmasters, now that you mention it."

Quite so. The arch of the foot has given way; the plantar ligaments have become stretched and the deep calf muscles weakened. Then, since bending of the weakened arch causes discomfort, the feet have become turned outwards, by which the bending of the foot is reduced to a minimum; and as the left foot is the more flattened, so it is turned out more than the right. Then the turning out of the toes causes the legs to splay outward from the knees downwards—a very conspicuous condition in a tall man like this one—and you notice that the left leg splays out more than the other.

"But we know that depression of the arch of the foot is brought about by standing for long periods. Continuous pressure on a living structure weakens it, while intermittent pressure strengthens it; so the man who stands on his feet continuously develops a flat instep and a weak calf, while the professional dancer or runner acquires a high instep and a strong calf. Now there are many occupations which involve prolonged standing and so induce the condition of flat foot: waiters, hall-porters, hawkers, policemen, shop-walkers, salesmen, and station officials are examples. But the waiter's gait is characteristic—a quick, shuffling walk which enables him to carry liquids without spilling them. This man walks with a long, swinging stride; he is obviously not a waiter. His dress and appearance in general exclude the idea of a hawker or even a hall-porter; he is a man of poor physique and so cannot be a policeman. The shop-walker or salesman is accustomed to move in relatively confined spaces, and so acquires a short, brisk step, and his dress tends to rather exuberant smartness; the station official patrols long platforms, often at a rapid pace, and so tends to take long strides, while his dress is dignified and neat rather than florid. The last-mentioned characteristics, you see, appear in the subject of our analysis; he agrees with the general description of a stationmaster. But if we therefore conclude that he is a stationmaster, we fall into the time-honoured fallacy of the undistributed middle term—the fallacy that haunts all brilliant guessers, including the detective, not only of romance, but too often also of real life. All that the observed facts justify us in inferring is that this man is engaged in some mode of life that necessitates a good deal of standing; the rest is mere guess-work."

"It's wonderful," said Polton, gazing at the now distant figure; "perfectly wonderful. I should never have known he was a stationmaster. With this and a glance of deep admiration at his employer, he took his departure.

"You will also observe," said Thorndyke, with a smile, "that a fortunate guess often brings more credit than a piece of sound reasoning with a less striking result."

"Yes, that is unfortunately the case, and it is certainly true in the present instance. Your reputation, as far as Polton is concerned, is now firmly established even if it was not before. In his eyes you are a wizard from whom nothing is hidden. But to return to these little pieces, as I must call them, for the lack of a better name. I can form no hypothesis as to their use. I seem to have no 'departure,' as the nautical phrase goes, from which to start an inquiry. I haven't even the material for guess-work. Ought I to be able to arrive at any opinion on the subject?"

Thorndyke picked up one of the pieces, fingering it delicately and inspecting with a critical eye the flat base on which it stood, and reflected for a few moments.

"It is easy to trace a connection when one knows all the facts," he said at length, "but it seems to me that you have the materials from which to form a conjecture. Perhaps I am wrong, but I think, when you have had more experience, you will find yourself able to work out a problem of this kind. What is required is constructive imagination and a rigorous exactness in reasoning. Now, you are a good reasoner, and you have recently shown me that you have the necessary imagination; you merely lack experience in the use of your faculties. When you learn my purpose in having these things made—as you will
XI. — THE AMBUSH

“I AM going to ask for your collaboration in another case,” said Thorndyke, a day or two later. “It appears to be one of suicide, but the solicitors to the ‘Griffin’ office have asked me to go down to the place, which is in the neighbourhood of Barnet, and be present at the post-mortem and the inquest. They have managed to arrange that the inquest shall take place directly after the post-mortem, so that we shall be able to do the whole business in a single visit.”

“Is the case one of any intricacy?” I asked.

“I don’t think so,” he answered. “It looks like a common suicide; but you can never tell. The importance of the case at present arises entirely from the heavy insurance; a verdict of suicide will mean a gain of ten thousand pounds to the ‘Griffin,’ so, naturally, the directors are anxious to get the case settled and not inclined to boggle over a little expense.”

“Naturally. And when will the expedition take place?” I asked.

“The inquest is fixed for to-morrow—what is the matter? Does that fall foul of any arrangement of yours?”

“Oh, nothing of any importance,” I replied hastily, deeply ashamed of the momentary change of countenance that my friend had been so quick to observe.

“Well, what is it?” persisted Thorndyke. “You have got something on.”

“It is nothing, I tell you, but what can be quite easily arranged to suit your plans.”

“Cherchez la—h’m?” queried Thorndyke, with an exasperating grin.

“Yes,” I answered, turning as red as a pickled cabbage; “since you are so beastly inquisitive. Miss Gibson wrote, on behalf of Mrs. Hornby, asking me to dine with them en famille to-morrow evening, and I sent off an acceptance an hour ago.”

“And you call that ‘nothing of any importance!’” exclaimed Thorndyke. “Alas! and likewise alackaday (which is an approximately synonymous expression)! The age of chivalry is past, indeed. Of course you must keep your appointment; I can manage quite well alone.”

“We shouldn’t be back early enough for me to go to Kensington from the station, I suppose?”

“No; certainly not. I find that the trains are very awkward; we should not reach King’s Cross until nearly one in the morning.”

“Then, in that case, I shall write to Miss Gibson and excuse myself.”

“Oh, I wouldn’t do that,” said Thorndyke; “it will disappoint them, and really it is not necessary.”

“I shall write forthwith,” I said firmly, “so please don’t try to dissuade me. I have been feeling quite uncomfortable at the thought that, all the time I have been in your employ, I seem to have done nothing but idle about and amuse myself. The opportunity of doing something tangible for my wage is too precious to be allowed to slip.”

Thorndyke chuckled indulgently. “You shall do as you please, my dear boy,” he said; “but don’t imagine that you have been eating the bread of idleness. When you see this Hornby case worked out in detail, you will be surprised to find how large a part you have taken in unravelling it. Your worth to me has been far beyond your poor little salary, I can assure you.”

“It is very handsome of you to say that,” I said, highly gratified to learn that I was really of use, and not, as I had begun to suspect, a mere object of charity.

“It is perfectly true,” he answered; “and now, since you are going to help me in this case, I will set you your task. The case, as I have said, appears to be quite simple, but it never does to take the simplicity for granted. Here is the letter from the solicitors giving the facts as far as they are known at present. On the shelves there you will find Casper, Taylor, Guy and Ferrier, and the other authorities on medical jurisprudence, and I will put out one or two other books that you may find useful. I want you to extract and make classified notes of everything that may bear on such a case as the present one may turn out to be. We must go prepared to meet any contingency that may arise. This is my invariable practice, and even if the case turns out to be quite simple, the labour is never wasted, for it represents so much experience gained.”

“Casper and Taylor are pretty old, aren’t they?” I objected.

“So is suicide,” he retorted drily. “It is a capital mistake to neglect the old authorities. There were strong men before Agamemnon, and some of them were uncommonly strong, let me tell you. Give your best attention to the venerable Casper and the obsolete Taylor and you will not be without your reward.”

As a result of these injunctions, I devoted the remainder of the day to the consideration of the various methods by which a man might contrive to effect his exit from the stage of human activities. And a very engaging study I found it, and the more interesting in view of the problem that awaited solution on the morrow; but yet not so engaging but that I was able to find time to write a long, rather intimate and minutely explanatory letter to Miss Gibson, in which I even mentioned the
hour of our return as showing the impossibility of my keeping my engagement. Not that I had the smallest fear of her taking offence, for it is an evidence of my respect and regard for her that I cancelled the appointment without a momentary doubt that she would approve of my action; but it was pleasant to write to her at length and to feel the intimacy of keeping her informed of the details of my life.

The case, when we came to inquire into it on the spot, turned out to be a suicide of the most transparent type; whereas both Thorndyke and I were, I think, a little disappointed—he at having apparently done so little for a very substantial fee, and I at having no opportunity for applying my recently augmented knowledge.

“Yes,” said my colleague, as we rolled ourselves up in our rugs in adjacent corners of the railway carriage, “it has been a flat affair, and the whole thing could have been managed by the local solicitor. But it is not a waste of time after all, for, you see, I have to do many a day’s work for which I get not a farthing of payment, nor even any recognition, so that I do not complain if I occasionally find myself receiving more payment than my actual services merit. And as to you, I take it that you have acquired a good deal of valuable knowledge on the subject of suicide, and knowledge, as the late Lord Bacon remarked with more truth than originality, is power.”

To this I made no reply, having just lit my pipe and feeling uncommonly drowsy; and, my companion having followed my example, we smoked in silence, becoming more and more somnolent, until the train drew up in the terminus and we turned out, yawning and shivering, on to the platform.

“Bah!” exclaimed Thorndyke, drawing his rug round his shoulders; “this is a cheerless hour—a quarter past one. See how chilly and miserable all these poor devils of passengers look. Shall we cab it or walk?”

“I think a sharp walk would rouse our circulation after sitting huddled up in the carriage for so long,” I answered.

“So do I,” said Thorndyke, “so let us away; hark forward! and also Tally Ho! In fact one might go so far as to say Yoicks! That gentleman appears to favour the strenuous life, if one may judge by the size of his sprocket-wheel.”

He pointed to a bicycle that was drawn up by the kerb in the approach—a machine of the road-racer type, with an enormous sprocket-wheel, indicating a gear of, at least, ninety.

“Some scorcher or amateur racer, probably,” I said, “who takes the opportunity of getting a spin on the wood pavement when the streets are empty.” I looked round to see if I could identify the owner, but the machine appeared to be, for the moment, taking care of itself.

King’s Cross is one of those districts of which the inhabitants are slow in settling down for the night, and even at a quarter past one in the morning its streets are not entirely deserted. Here and there the glimmer of a street lamp or the far-reaching ray from a tall electric light reveals the form of some nocturnal prowler creeping along with cat-like stealthiness, or bursting, cat-like, into unmelodious song. Not greatly desirous of the society of these roysterers, we crossed quickly from the station into the Gray’s Inn Road, now silent and excessively dismal in aspect, and took our way along the western side. We had turned the curve and were crossing Manchester Street, when a series of yelps from ahead announced the presence of a party of merry-makers, whom we were not yet able to see, however, for the night was an exceptionally dark one; but the sounds of revelry continued to increase in volume as we proceeded, until, as we passed Sidmouth Street, we came in sight of the revellers. They were some half-dozen in number, all of them roughs of the hooligan type, and they were evidently in boisterous spirits, for, as they passed the entrance to the Royal Free Hospital, they halted and battered furiously at the gate. Shortly after this exploit they crossed the road on to our side, whereupon Thorndyke caught my arm and slackened his pace.

“Let them draw ahead,” said he. “It is a wise precaution to give all hooligan gangs a very wide berth at this time of night. We had better turn down Heathcote Street and cross Mecklenburgh Square.”

We continued to walk on at reduced speed until we reached Heathcote Street, into which we turned and so entered Mecklenburgh Square, where we mended our pace once more.

“The hooligan,” pursued Thorndyke, as we walked briskly across the silent square, “covers a multitude of sins, ranging from highway robbery with violence and paid assassination (technically known as ‘bashing’) down to the criminal folly of the philanthropic magistrate, who seems to think that his function in the economy of nature is to secure the survival of the unfittest. There goes a cyclist along Guildford Street. I wonder if that is our strenuous friend from the station. If so, he has slipped past the hooligans.”

We were just entering Doughty Street, and, as Thorndyke spoke, a man on a bicycle was visible for an instant at the crossing of the two streets. When we reached Guildford Street we both looked down the long, lamp-lighted vista, but the cyclist had vanished.

“We had better go straight on into Theobald’s Road,” said Thorndyke, and we accordingly pursued our way up the fine old-world street, from whose tall houses our footfalls echoed, so that we seemed to be accompanied by an invisible multitude, until we reached that part where it unaccountably changes its name and becomes John Street.

“There always seems to me something very pathetic about these old Bloomsbury streets,” said Thorndyke, “with their faded grandeur and dignified sordidness. They remind me of some prim and aged gentlewoman in reduced circumstances who—Hallo! What was that?”

A faint, sharp thud from behind had been followed instantly by the shattering of a ground-floor window in front.
We both stopped dead and remained, for a couple of seconds, staring into the gloom, from whence the first sound had come; then Thorndyke darted diagonally across the road at a swift run and I immediately followed.

At the moment when the affair happened we had gone about forty yards up John Street, that is, from the place where it is crossed by Henry Street, and we now raced across the road to the further corner of the latter street. When we reached it, however, the little thoroughfare was empty, and, as we paused for a moment, no sound of retreating footsteps broke the silence.

“The shot certainly came from here!” said Thorndyke; “come on,” and he again broke into a run. A few yards up the street a mews turns off to the left, and into this my companion plunged, motioning me to go straight on, which I accordingly did, and in a few paces reached the top of the street. Here a narrow thoroughfare, with a broad, smooth pavement, bears off to the left, parallel with the mews, and, as I arrived at the corner and glanced up the little street, I saw a man on a bicycle gliding swiftly and silently towards Little James’ Street.

With a mighty shout of “Stop thief!” I started in hot pursuit, but, though the man’s feet were moving in an apparently leisurely manner, he drew ahead at an astonishing pace, in spite of my efforts to overtake him; and it then dawned upon me that the slow revolutions of his feet were due, in reality, to the unusually high gear of the machine that he was riding. As I realised this, and at the same moment recalled the bicycle that we had seen in the station, the fugitive swung round into Little James’ Street and vanished.

The speed at which the man was travelling made further pursuit utterly futile, so I turned and walked back, panting and perspiring from the unwonted exertion. As I re-entered Henry Street, Thorndyke emerged from the mews and halted on seeing me.

“Cyclist?” he asked laconically, as I came up.

“Yes,” I answered; “riding a machine geared up to about ninety.”

“Ah! he must have followed us from the station,” said Thorndyke. “Did you notice if he was carrying anything?”

“He had a walking-stick in his hand. I didn’t see anything else.”

“What sort of walking-stick?”

“I couldn’t see very distinctly. It was a stoutish stick—I should say a Malacca, probably—and it had what looked like a horn handle. I could see that as he passed a street lamp.”

“What kind of lamp had he?”

“I couldn’t see; but, as he turned the corner, I noticed that it seemed to burn very dimly.”

“A little vaseline, or even oil, smeared on the outside of the glass will reduce the glare of a lamp very appreciably,” my companion remarked, “especially on a dusty road. Ha! here is the proprietor of the broken window. He wants to know, you know.”

We had once more turned into John Street and now perceived a man, standing on the wide doorstep of the house with the shattered window, looking anxiously up and down the street.

“Do either of you gents know anything about this here?” he asked, pointing to the broken pane.

“Yes,” said Thorndyke, “we happened to be passing when it was done; in fact,” he added, “I rather suspect that the missile, whatever it was, was intended for our benefit.”

“Oh!” said the man. “Who done it?”

“That I can’t say,” replied Thorndyke. “Whoever he was, he made off on a bicycle and we were unable to catch him.”

“Oh!” said the man once more, regarding us with growing suspicion. “On a bicycle, hay! Dam funny, ain’t it? What did he do it with?”

“That is what I should like to find out,” said Thorndyke. “I see this house is empty.”

“Yes, it’s empty—leastways it’s to let. I’m the caretaker. But what’s that got to do with it?”

“Merely this,” answered Thorndyke, “that the object—stone, bullet or whatever it may have been—was aimed, I believe, at me, and I should like to ascertain its nature. Would you do me the favour of permitting me to look for it?”

The caretaker was evidently inclined to refuse this request, for he glanced suspiciously from my companion to me once or twice before replying, but, at length, he turned towards the open door and gruffly invited us to enter.

A paraffin lamp was on the floor in a recess of the hall, and this our conductor took up when he had closed the street door.

“This is the room,” he said, turning the key and thrusting the door open; “the library they call it, but it’s the front parlour in plain English.” He entered and, holding the lamp above his head, stared balefully at the broken window.

Thorndyke glanced quickly along the floor in the direction that the missile would have taken, and then said—

“Do you see any mark on the wall there?”
As he spoke, he indicated the wall opposite the window, which obviously could not have been struck by a projectile entering with such extreme obliquity; and I was about to point out this fact when I fortunately remembered the great virtue of silence.

Our friend approached the wall, still holding up the lamp, and scrutinised the surface with close attention; and while he was thus engaged, I observed Thorndyke stoop quickly and pick up something, which he deposited carefully, and without remark, in his waistcoat pocket.

“I don’t see no bruise anywhere,” said the caretaker, sweeping his hand over the wall.

Perhaps the thing struck this wall,” suggested Thorndyke, pointing to the one that was actually in the line of fire. “Yes, of course,” he added, “it would be this one—the shot came from Henry Street.”

The caretaker crossed the room and threw the light of his lamp on the wall thus indicated.

“Ah! here we are!” he exclaimed, with gloomy satisfaction, pointing to a small dent in which the wall-paper was turned back and the plaster exposed; “looks almost like a bullet mark, but you say you didn’t hear no report.”

“No,” said Thorndyke, “there was no report; it must have been a catapult.”

The caretaker set the lamp down on the floor and proceeded to grope about for the projectile, in which operation we both assisted; and I could not suppress a faint smile as I noted the earnestness with which Thorndyke peered about the floor in search of the missile that was quietly reposing in his waistcoat pocket.

We were deep in our investigations when there was heard an uncompromising double knock at the street door, followed by the loud pealing of a bell in the basement.

“Bobby, I suppose,” groveled the caretaker. “Here’s a blooming fuss about nothing.” He caught up the lamp and went out, leaving us in the dark.

“I picked it up, you know,” said Thorndyke, when we were alone.

“I saw you,” I answered.

“Good; I applaud your discretion,” he rejoined. The caretaker’s supposition was correct. When he returned, he was accompanied by a burly constable, who saluted us with a cheerful smile and glanced facetiously round the empty room.

“Our boys,” said he, nodding towards the broken window; “they’re playful lads, that they are. You were passing when it happened, sir, I hear.”

“Yes,” answered Thorndyke; and he gave the constable a brief account of the occurrence, which the latter listened to, notebook in hand.

“Well,” said he when the narrative was concluded, “if those hooligan boys are going to take to catapults they’ll make things lively all round.”

“You ought to run some of ’em in,” said the caretaker.

“Run ’em in!” exclaimed the constable in a tone of disgust; “yes! And then the magistrate will tell ’em to be good boys and give ’em five shillings out of the poor-box to buy illustrated Testaments. I’d Testament them, the worthless varmints!”

He rammed his notebook fiercely into his pocket and stalked out of the room into the street, whither we followed.

“You’ll find that bullet or stone when you sweep up the room,” he said, as he turned on to his beat; “and you’d better let us have it. Good night, sir.”

He strolled off towards Henry Street, while Thorndyke and I resumed our journey southward.

“Why were you so secret about that projectile?” I asked my friend as we walked up the street.

“Partly to avoid discussion with the caretaker,” he replied; “but principally because I thought it likely that a constable would pass the house and, seeing the light, come in to make inquiries.”

“And then?”

“Then I should have had to hand over the object to him.”

“And why not? Is the object a specially interesting one?”

“It is highly interesting to me at the present moment,” replied Thorndyke, with a chuckle, “because I have not examined it. I have a theory as to its nature, which theory I should like to test before taking the police into my confidence.”

“Are you going to take me into your confidence?” I asked.

“When we get home, if you are not too sleepy,” he replied.

On our arrival at his chambers, Thorndyke desired me to light up and clear one end of the table while he went up to the workshop to fetch some tools. I turned back the table cover, and, having adjusted the gas so as to light this part of the table, waited in some impatience for my colleague’s return. In a few minutes he re-entered bearing a small vice, a metal saw and a wide-mouthed bottle.
“What have you got in that bottle?” I asked, perceiving a metal object inside it.

“That is the projectile, which I have thought fit to rinse in distilled water, for reasons that will presently appear.”

He agitated the bottle gently for a minute or so, and then, with a pair of dissecting forceps, lifted out the object and held it above the surface of the water to drain, after which he laid it carefully on a piece of blotting-paper.

I stooped over the projectile and examined it with great curiosity, while Thorndyke stood by regarding me with almost equal interest.

“Well,” he said, after watching me in silence for some time, “what do you see?”

“I see a small brass cylinder,” I answered, “about two inches long and rather thicker than an ordinary lead pencil. One end is conical, and there is a small hole at the apex which seems to contain a steel point; the other end is flat, but has in the centre a small square projection such as might fit a watch-key. I notice also a small hole in the side of the cylinder close to the flat end. The thing looks like a miniature shell, and appears to be hollow.”

“It is hollow,” said Thorndyke. “You must have observed that, when I held it up to drain, the water trickled out through the hole at the pointed end.”

“Yes, I noticed that.”

“Now take it up and shake it.”

I did so and felt some heavy object rattle inside it.

“There is some loose body inside it,” I said, “which fits it pretty closely, as it moves only in the long diameter.”

“Quite so; your description is excellent. And now, what is the nature of this projectile?”

“I should say it is a miniature shell or explosive bullet.”

“Wrong!” said Thorndyke. “A very natural inference, but a wrong one.”

“Then what is the thing?” I demanded, my curiosity still further aroused.

“I will show you,” he replied. “It is something much more subtle than an explosive bullet—which would really be a rather crude appliance—admirably thought out and thoroughly well executed. We have to deal with a most ingenious and capable man.”

I was fain to laugh at his enthusiastic appreciation of the methods of his would-be assassin, and the humour of the situation then appeared to dawn on him, for he said, with an apologetic smile—

“I am not expressing approval, you must understand, but merely professional admiration. It is this class of criminal that creates the necessity for my services. He is my patron, so to speak; my ultimate employer. For the common crook can be dealt with quite efficiently by the common policeman!”

While he was speaking he had been fitting the little cylinder between two pads of tissue-paper in the vice, which he now screwed up tight. Then, with the fine metal saw, he began to cut the projectile, lengthwise, into two slightly unequal parts. This operation took some time, especially since he was careful not to cut the loose body inside, but at length the section was completed and the interior of the cylinder exposed, when he released it from the vice and held it up before me with an expression of triumph.

“Now, what do you make it?” he demanded.

I took the object in my fingers and looked at it closely, but was at first more puzzled than before. The loose body I now saw to be a cylinder of lead about half an inch long, accurately fitting the inside of the cylinder but capable of slipping freely backwards and forwards. The steel point which I had noticed in the hole at the apex of the conical end, was now seen to be the pointed termination of a slender steel rod which projected fully an inch into the cavity of the cylinder, and the conical end itself was a solid mass of lead.

“Well?” queried Thorndyke, seeing that I was still silent.

“You tell me it is not an explosive bullet,” I replied, “otherwise I should have been confirmed in that opinion. I should have said that the percussion cap was carried by this lead plunger and struck on the end of that steel rod when the flight of the bullet was suddenly arrested.”

“Very good indeed,” said Thorndyke. “You are right so far that this is, in fact, the mechanism of a percussion shell.

“But look at this. You see this little rod was driven inside the bullet when the latter struck the wall. Let us replace it in its original position.”

He laid the end of a small flat file against the end of the rod and pressed it firmly, when the rod slid through the hole until it projected an inch beyond the apex of the cone. Then he handed the projectile back to me.

A single glance at the point of the steel rod made the whole thing clear, and I gave a whistle of consternation; for the “rod” was a fine tube with a sharply pointed end.

“The infernal scoundrel!” I exclaimed; “it is a hypodermic needle.”
"Yes. A veterinary hypodermic, of extra large bore. Now you see the subtlety and ingenuity of the whole thing. If he had had a reasonable chance he would certainly have succeeded."

"You speak quite regretfully," I said, laughing again at the oddity of his attitude towards the assassin.

"Not at all," he replied. "I have the character of a single-handed player, but even the most self-reliant man can hardly make a post-mortem on himself. I am merely appreciating an admirable piece of mechanical design most efficiently carried out. Observe the completeness of the thing, and the way in which all the necessities of the case are foreseen and met. This projectile was discharged from a powerful air-gun—the walking-stick form—provided with a force-pump and key. The barrel of that gun was rifled."

"How do you know that?" I asked.

"Well, to begin with, it would be useless to fit a needle to the projectile unless the latter was made to travel with the point forwards; but there is direct evidence that the barrel was rifled. You notice the little square projection on the back surface of the cylinder. That was evidently made to fit a washer or wad—probably a thin plate of soft metal which would be driven by the pressure from behind into the grooves of the rifling and thus give a spinning motion to the bullet. When the latter left the barrel, the wad would drop off, leaving it free."

"I see. I was wondering what the square projection was for. It is, as you say, extremely ingenious."

"Highly ingenious," said Thorndyke, enthusiastically, "and so is the whole device. See how perfectly it would have worked but for a mere fluke and for the complication of your presence. Supposing that I had been alone, so that he could have approached to a shorter distance. In that case he would not have missed, and the thing would have been done. You see how it was intended to be done, I suppose?"

"I think so," I answered; "but I should like to hear your account of the process."

"Well, you see, he first finds out that I am returning by a late train—which he seems to have done—and he waits for me at the terminus. Meanwhile he fills the cylinder with a solution of a powerful alkaloidal poison, which is easily done by dipping the needle into the liquid and sucking at the small hole near the back end, when the piston will be drawn up and the liquid will follow it. You notice that the upper side of the piston is covered with vaseline—introduced through the hole, no doubt—which would prevent the poison from coming out into the mouth, and make the cylinder secure from leakage. On my arrival, he follows me on his bicycle until I pass through a sufficiently secluded neighbourhood. Then he approaches me, or passes me and waits round a corner, and shoots at pretty close range. It doesn’t matter where he hits me; all parts are equally vital, so he can aim at the middle of my back. Then the bullet comes spinning through the air point foremost; the needle passes through the clothing and enters the flesh, and, as the bullet is suddenly stopped, the heavy piston flies down by its own great momentum and squirts out a jet of the poison into the tissues. The bullet then disengages itself and drops on to the ground.

"Meanwhile, our friend has mounted his bicycle and is off, and when I feel the prick of the needle, I turn, and, without stopping to look for the bullet, immediately give chase. I am, of course, not able to overtake a man on a racing machine, but still I follow him some distance. Then the poison begins to take effect—the more rapidly from the violent exercise—and presently I drop insensible. Later on, my body is found. There are no marks of violence, and probably the needle-puncture escapes observation at the post-mortem, in which case the verdict will be death from heart-failure. Even if the poison and the puncture are discovered, there is no clue. The bullet lies some streets away, and is probably picked up by some boy or passing stranger, who cannot conjecture its use, and who would never connect it with the man who was found dead. You will admit that the whole plan has been worked out with surprising completeness and foresight."

"Yes," I answered; "there is no doubt that the fellow is a most infernally clever scoundrel. May I ask if you have any idea who he is?"

"Well," Thorndyke replied, "seeing that, as Carlyle has unkindly pointed out, clever people are not in an overwhelming majority, and that, of the clever people whom I know, only a very few are interested in my immediate demise, I am able to form a fairly probable conjecture."

"And what do you mean to do?"

"For the present I shall maintain an attitude of masterly inactivity and avoid the night air."

"But, surely," I exclaimed, "you will take some measures to protect yourself against attempts of this kind. You can hardly doubt now that your accident in the fog was really an attempted murder."

"I never did doubt it, as a matter of fact, although I prevaricated at the time. But I have not enough evidence against this man at present, and, consequently, can do nothing but show that I suspect him, which would be foolish. Whereas, if I lie low, one of two things will happen; either the occasion for my removal (which is only a temporary one) will pass, or he will commit himself—will put a definite clue into my hands. Then we shall find the air-cane, the bicycle, perhaps a little stock of poison, and certain other trifles that I have in my mind, which will be good confirmatory evidence, though insufficient in themselves. And now, I think, I must really adjourn this meeting, or we shall be good for nothing to-morrow."

XII. — IT MIGHT HAVE BEEN
It was now only a week from the date on which the trial was to open. In eight days the mystery would almost certainly be solved (if it was capable of solution), for the trial promised to be quite a short one, and then Reuben Hornby would be either a convicted felon or a free man, clear of the stigma of the crime.

For several days past, Thorndyke had been in almost constant possession of the laboratory, while his own small room, devoted ordinarily to bacteriology and microscopical work was kept continually locked; a state of things that reduced Polton to a condition of the most extreme nervous irritation, especially when, as he told me indignantly, he met Mr. Anstey emerging from the holy of holies, grinning and rubbing his hands and giving utterance to genial but unparliamentary expressions of amused satisfaction.

I had met Anstey on several occasions lately, and each time liked him better than the last; for his whimsical, facetious manner covered a nature (as it often does) that was serious and thoughtful; and I found him, not only a man of considerable learning, but one also of a lofty standard of conduct. His admiration for Thorndyke was unbounded, and I could see that the two men collaborated with the utmost sympathy and mutual satisfaction.

But although I regarded Mr. Anstey with feelings of the liveliest friendship, I was far from gratified when, on the morning of which I am writing, I observed him from our sitting-room window crossing the gravelled space from Crown Office Row and evidently bearing down on our chambers. For the fact is that I was awaiting the arrival of Juliet, and should greatly have preferred to be alone at the moment, seeing that Thorndyke had already gone out. It is true that my fair enslaver was not due for nearly half-an-hour, but then, who could say how long Anstey would stay, or what embarrassments might arise from my efforts to escape? By all of which it may be perceived that my disease had reached a very advanced stage, and that I was unequal to those tactics of concealment that are commonly attributed to the ostrich.

A sharp rap of the knocker announced the arrival of the disturber of my peace, and when I opened the door Anstey walked in with the air of a man to whom an hour more or less is of no consequence whatever. He shook my hand with mock solemnity, and, seating himself upon the edge of the table, proceeded to roll a cigarette with exasperating deliberation.

"I infer," said he, "that our learned brother is practising parlour magic upstairs, or peradventure he has gone on a journey?"

"He has a consultation this morning," I answered. "Was he expecting you?"

"Evidently not, or he would have been here. No, I just looked in to ask a question about the case of your friend Hornby. You know it comes on for trial next week?"

"Yes; Thorndyke told me. What do you think of Hornby's prospects? Is he going to be convicted, or will he get an acquittal?"

"He will be entirely passive," replied Anstey, "but we"—here he slapped his chest impressively—"are going to secure an acquittal. You will be highly entertained, my learned friend, and Mr. The Enemy will be excessively surprised." He inspected the newly-made cigarette with a critical air and chuckled softly.

"You seem pretty confident," I remarked.

"I am," he answered, "though Thorndyke considers failure possible—which, of course, it is if the jury-box should chance to be filled with microcephalic idiots and the judge should prove incapable of understanding simple technical evidence. But we hope that neither of these things will happen, and, if they do not, we feel pretty safe. By the way, I hope I am not divulging your principal's secrets?"

"Well," I replied, with a smile, "you have been more explicit than Thorndyke ever has."

"Have I?" he exclaimed, with mock anxiety; "then I must swear you to secrecy. Thorndyke is so very close—and he is quite right too. I never cease admiring his tactics of allowing the enemy to fortify and barricade the entrance that he does not mean to attack. But I see you are wishing me at the devil, so give me a cigar and I will go—though not to that particular destination."

"Will you have one of Thorndyke's special brand?" I asked maliciously.

"What! those foul Trichinopolies? Not while brown paper is to be obtained at every stationer's; I'd sooner smoke my own wig."

I tendered my own case, from which he selected a cigar with anxious care and much sniffing; then he bade me a ceremonious adieu and departed down the stairs, blithely humming a melody from the latest comic opera.

He had not left more than five minutes when a soft and elaborate rat-tat from the little brass knocker brought my heart into my mouth. I ran to the door and flung it open, revealing Juliet standing on the threshold.

"May I come in?" she asked. "I want to have a few words with you before we start."

I looked at her with some anxiety, for she was manifestly agitated, and the hand that she held out to me trembled.

"I am greatly upset, Dr. Jervis," she said, ignoring the chair that I had placed for her. "Mr. Lawley has been giving us his views of poor Reuben's case, and his attitude fills me with dismay."

"Hang Mr. Lawley!" I muttered, and then apologised hastily. "What made you go to him, Miss Gibson?"
“I didn’t go to him; he came to us. He dined with us last night—he and Walter—and his manner was gloomy in the extreme. After dinner Walter took him apart with me and asked him what he really thought of the case. He was most pessimistic. ‘My dear sir,’ he said, ‘the only advice I can give you is that you prepare yourself to contemplate disaster as philosophically as you can. In my opinion your cousin is almost certain to be convicted.’ But,’ said Walter, ‘what about the defence? I understood that there was at least a plausible case.’ Mr. Lawley shrugged his shoulders. ‘I have a sort of alibi; that will go for nothing, but I have no evidence to offer in answer to that of the prosecution, and no case; and I may say, speaking in confidence, that I do not believe there is any case. I do not see how there can be any case, and I have heard nothing from Dr. Thorndyke to lead me to suppose that he has really done anything in the matter.’ Is this true, Dr. Jervis? Oh! do tell me the real truth about it! I have been so miserable and terrified since I heard this, and I was so full of hope before. Tell me, is it true? Will Reuben be sent to prison after all?”

In her agitation she laid her hands on my arm and looked up into my face with her grey eyes swimming with tears, and was so piteous, so trustful, and, withal, so bewitching that my reserve melted like snow before a July sun.

“It is not true,” I answered, taking her hands in mine and speaking perforce in a low tone that I might not betray my emotion. “If it were, it would mean that I have wilfully deceived you, that I have been false to our friendship; and how much that friendship has been to me, no one but myself will ever know.”

She crept a little closer to me with a manner at once penitent and wheedling.

“You are not going to be angry with me, are you? It was foolish of me to listen to Mr. Lawley after all you have told me, and it did look like a want of trust in you, I know. But you, who are so strong and wise, must make allowance for a woman who is neither. It is all so terrible that I am quite unstrung; but say you are not really displeased with me, for that would hurt me most of all.”

Oh! Delilah! That concluding stroke of the shears severed the very last lock, and left me—morally speaking—as bald as a billiard ball. Henceforth I was at her mercy and would have divulged, without a scruple, the uttermost secrets of my principal, but that that astute gentleman had placed me beyond the reach of temptation.

“As to being angry with you,” I answered, “I am not, like Thorndyke, one to essay the impossible, and if I could be angry it would hurt me more than it would you. But, in fact, you are not to blame at all, and I am an egotistical brute. Of course you were alarmed and distressed; nothing could be more natural. So now let me try to chase away your fears and restore your confidence.

“I have told you what Thorndyke said to Reuben: that he had good hopes of making his innocence clear to everybody. That alone should have been enough.”

“I know it should,” murmured Juliet remorsefully; “please forgive me for my want of faith.”

“But,” I continued, “I can quote you the words of one to whose opinions you will attach more weight. Mr. Anstey was here less than half-an-hour ago—”

“Do you mean Reuben’s counsel?”

“Yes.”

“And what did he say? Oh, do tell me what he said.”

“He said, in brief, that he was quite confident of obtaining an acquittal, and that the prosecution would receive a great surprise. He seemed highly pleased with his brief, and spoke with great admiration of Thorndyke.”

“Did he really say that—that he was confident of an acquittal?” Her voice was breathless and unsteady, and she was clearly, as she had said, quite unstrung. “What a relief it is,” she murmured incoherently; “and so very, very kind of you!” She wiped her eyes and laughed a queer, shaky little laugh; then, quite suddenly, she burst into a passion of sobbing.

Hardly conscious of what I did, I drew her gently towards me, and rested her head on my shoulder whilst I whispered into her ear I knew not what words of consolation; but I am sure that I called her “dear Juliet,” and probably used other expressions equally improper and reprehensible. Presently she recovered herself, and, having dried her eyes, regarded me somewhat shamefacedly, blushing hotly, but smiling very sweetly nevertheless.

“I am ashamed of myself,” she said, “coming here and weeping on your bosom like a great baby. It is to be hoped that your other clients do not behave in this way.”

Whereat we both laughed heartily, and, our emotional equilibrium being thus restored, we began to think of the object of our meeting.

“I am afraid I have wasted a great deal of time,” said Juliet, looking at her watch. “Shall we be too late, do you think?”

“I hope not,” I replied, “for Reuben will be looking for us; but we must hurry.”

I caught up my hat, and we went forth, closing the oak behind us, and took our way up King’s Bench Walk in silence, but with a new and delightful sense of intimate comradeship. I glanced from time to time at my companion, and noted that her cheek still bore a rosy flush, and when she looked at me there was a sparkle in her eye, and a smiling softness in her glance, that stirred my heart until I trembled with the intensity of the passion that I must needs conceal. And even while I was feeling that I must tell her all, and have done with it, tell her that I was her abject slave, and she my goddess, my queen;
that in the face of such a love as mine no man could have any claim upon her; even then, there arose the still, small voice that began to call me an unfaithful steward and to remind me of a duty and trust that were sacred even beyond love.

In Fleet Street I hailed a cab, and, as I took my seat beside my fair companion, the voice began to wax and speak in bolder and stern accents.

“Christopher Jervis,” it said, “what is this that you are doing? Are you a man of honour or nought but a mean, pitiful blackguard? You, the trusted agent of this poor, misused gentleman, are you not planning in your black heart how you shall rob him of that which, if he is a man at all, must be more to him than his liberty, or even his honour? Shame on you for a miserable weakling! Have done with these philanderings and keep your covenants like a gentleman—or, at least, an honest man!”

At this point in my meditations Juliet turned towards me with a cooing smile.

“My legal adviser seems to be revolving some deep and weighty matter,” she said.

I pulled myself together and looked at her—at her sparkling eyes and rosy, dimpling cheeks, so winsome and lovely and lovable.

“Come,” I thought, “I must put an end to this at once, or I am lost.” But it cost me a very agony of effort to do it—which agony, I trust, may be duly set to my account by those who may sit in judgement on me.

“Your legal adviser, Miss Gibson,” I said (and at that “Miss Gibson” I thought she looked at me a little queerly), “has been reflecting that he has acted considerably beyond his jurisdiction.”

“In what respect?” she asked.

“In passing on to you information which was given to him in very strict confidence, and, in fact, with an implied promise of secrecy on his part.”

“But the information was not of a very secret character, was it?”

“More so than it appeared. You see, Thorndyke thinks it so important not to let the prosecution suspect that he has anything up his sleeve, that he has kept even Mr. Lawley in the dark, and he has never said as much to me as Anstey did this morning.”

“And now you are sorry you told me; you think I have led you into a breach of trust. Is it not so?” She spoke without a trace of petulance, and her tone of dignified self-accusation made me feel a veritable worm.

“My dear Miss Gibson,” I expostulated, “you entirely misunderstand me. I am not in the least sorry that I told you. How could I have done otherwise under the circumstances? But I want you to understand that I have taken the responsibility of communicating to you what is really a professional secret, and that you are to consider it as such.”

“That was how I understood it,” replied Juliet; “and you may rely upon me not to utter a syllable on the subject to anyone.”

I thanked her for this promise, and then, by way of making conversation, gave her an account in detail of Anstey’s visit, not even omitting the incident of the cigar.

“And are Dr. Thorndyke’s cigars so extraordinarily bad?” she asked.

“Not at all,” I replied; “only they are not to every man’s taste. The Trichinopoly cheroot is Thorndyke’s one dissipation, and, I must say, he takes it very temperately. Under ordinary circumstances he smokes a pipe; but after a specially heavy day’s work, or on any occasion of festivity or rejoicing, he indulges in a Trichinopoly, and he smokes the very best that can be got.”

“So even the greatest men have their weaknesses,” Juliet moralised; “but I wish I had known Dr. Thorndyke’s sooner, for Mr. Hornby had a large box of Trichinopoly cheroots given to him, and I believe they were exceptionally fine ones. However, he tried one and didn’t like it, so he transferred the whole consignment to Walter, who smokes all sorts and conditions of cigars.”

So we talked on from one commonplace to another, and each more conventional than the last. In my nervousness, I overdid my part, and having broken the ice, proceeded to smash it to impalpable fragments. Endeavouring merely to be unemotional and to avoid undue intimacy of manner, I swung to the opposite extreme and became almost stiff; and perhaps the more so since I was writhing with the agony of repression.

Meanwhile a corresponding change took place in my companion. At first her manner seemed doubtful and bewildered; then she, too, grew more distant and polite and less disposed for conversation. Perhaps her conscience began to reprove her, or it may be that my coolness suggested to her that her conduct had not been quite of the kind that would have commended itself to Reuben. But however that may have been, we continued to draw farther and farther apart; and in that short half-hour we retraced the steps of our growing friendship to such purpose that, when we descended from the cab at the prison gate, we seemed more like strangers than on the first day that we met. It was a miserable ending to all our delightful comradeship, and yet what other end could one expect in this world of cross purposes and things that might have been? In the extremity of my wretchedness I could have wept on the bosom of the portly warder who opened the wicket, even as Juliet had wept upon mine; and it was almost a relief to me, when our brief visit was over, to find that we
should not return together to King’s Cross as was our wont, but that Juliet would go back by omnibus that she might do some shopping in Oxford Street, leaving me to walk home alone.

I saw her into her omnibus, and stood on the pavement looking wistfully at the lumbering vehicle as it dwindled in the distance. At last, with a sigh of deepest despondency, I turned my face homeward, and, walking like one in a dream, retraced the route over which I had journeyed so often of late and with such different sensations.

---

XIII. — MURDER BY POST

The next few days were perhaps the most unhappy that I have known. My life, indeed, since I had left the hospital had been one of many disappointments and much privation. Unfulfilled desires and ambitions unrealised had combined with distaste for the daily drudgery that had fallen to my lot to embitter my poverty and cause me to look with gloomy distrust upon the unpromising future. But no sorrow that I had hitherto experienced could compare with the grief that I now felt in contemplating the irretrievable ruin of what I knew to be the great passion of my life. For to a man like myself, of few friends and deep affections, one great emotional upheaval exhausts the possibilities of nature; leaving only the capacity for feeble and ineffective echoes. The edifice of love that is raised upon the ruins of a great passion can compare with the original no more than can the paltry mosque that perches upon the mound of Jonah with the glories of the palace that lies entombed beneath.

I had made a pretext to write to Juliet and had received a reply quite frank and friendly in tone, by which I knew that she had not—as some women would have done—set the blame upon me for our temporary outburst of emotion. And yet there was a subtle difference from her previous manner of writing that only emphasised the finality of our separation.

I think Thorndyke perceived that something had gone awry, though I was at great pains to maintain a cheerful exterior and keep myself occupied, and he probably formed a pretty shrewd guess at the nature of the trouble; but he said nothing, and I only judged that he had observed some change in my manner by the fact that there was blended with his usual quiet geniality an almost insensible note of sympathy and affection.

A couple of days after my last interview with Juliet, an event occurred which served, certainly, to relieve the tension and distract my thoughts, though not in a very agreeable manner.

It was the pleasant, reposeful hour after dinner when it was our custom to sit in our respective easy chairs and, as we smoked our pipes, discuss some of the many topics in which we had a common interest. The postman had just discharged into the capacious letter-box an avalanche of letters and circulars, and as I sat glancing through the solitary letter that had fallen to my share, I looked from time to time at Thorndyke and noticed, as I had often done before, with some surprise, a curious habit that he had of turning over and closely scrutinising every letter and package before he opened it.

“I observe, Thorndyke,” I now ventured to remark, “that you always examine the outside of a letter before looking at the inside. I have seen other people do the same, and it has always appeared to me a singularly foolish proceeding. Why speculate over an unopened letter when a glance at the contents will tell you all there is to know?”

“You are perfectly right,” he answered, “if the object of the inspection is to discover who is the sender of the letter. But that is not my object. In my case the habit is one that has been deliberately cultivated—not in reference to letters only, but to everything that comes into my hands—the habit of allowing nothing to pass without a certain amount of conscious attention. The observant man is, in reality, the attentive man, and the so-called power of observation is simply the capacity for continuous attention. As a matter of fact, I have found in practice, that the habit is a useful one even in reference to letters; more than once I have gleaned a hint from the outside of a letter that has proved valuable when applied to the contents. Here, for instance, is a letter which has been opened after being fastened up—apparently by the aid of steam. The envelope is soiled and rubbed, and smells faintly of stale tobacco, and has evidently been carried in a pocket along with a well-used pipe. Why should it have been opened? On reading it I perceive that it should have reached me two days ago, and that the date has been skilfully altered from the thirteenth to the fifteenth. The inference is that my correspondent has a highly untrustworthy clerk.”

“But the correspondent may have carried the letter in his own pocket,” I objected.

“Hardly,” replied Thorndyke. “He would not have troubled to steam his own letter open and close it again; he would have cut the envelope and addressed a fresh one. This the clerk could not do, because the letter was confidential and was addressed in the principal’s handwriting. And the principal would have almost certainly added a postscript; and, moreover, he does not smoke. This, however, is all very obvious; but here is something rather more subtle which I have put aside for more detailed examination. What do you make of it?”

He handed me a small parcel to which was attached by string a typewritten address label, the back of which bore the printed inscription, “James Bartlett and Sons, Cigar Manufacturers, London and Havana.”

“I am afraid,” said I, after turning the little packet over and examining every part of it minutely, “that this is rather too subtle for me. The only thing that I observe is that the typewriter has bungled the address considerably. Otherwise this seems to me a very ordinary packet indeed.”

“Well, you have observed one point of interest, at any rate,” said Thorndyke, taking the packet from me. “But let us examine the thing systematically and note down what we see. In the first place, you will notice that the label is an ordinary
luggage label such as you may buy at any stationer’s, with its own string attached. Now, manufacturers commonly use a different and more substantial pattern, which is attached by the string of the parcel. But that is a small matter. What is much more striking is the address on the label. It is typewritten and, as you say, typed very badly. Do you know anything about typewriters?”

“Very little.”

“Then you do not recognise the machine? Well, this label was typed with a Blickensderfer—an excellent machine, but not the form most commonly selected for the rough work of a manufacturer’s office; but we will let that pass. The important point is this: the Blickensderfer Company make several forms of machine, the smallest and lightest of which is the literary, specially designed for the use of journalists and men of letters. Now this label was typed with the literary machine, or, at least, with the literary typewheel; which is really a very remarkable circumstance indeed.”

“How do you know that?” I asked.

“By this asterisk, which has been written by mistake, the inexpert operator having pressed down the figure lever instead of the one for capitals. The literary typewheel is the only one that has an asterisk, as I noticed when I was thinking of purchasing a machine. Here, then, we have a very striking fact, for even if a manufacturer chose to use a ‘Blick’ in his factory, it is inconceivable that he should select the literary form in preference to the more suitable ‘commercial’ machine.”

“Yes,” I agreed; “it is certainly very singular.”

“And now,” pursued Thorndyke, “to consider the writing itself. It has been done by an absolute beginner. He has failed to space in two places, he has written five wrong letters, and he has written figures instead of capitals in two instances.”

“Yes; he has made a shocking muddle of it. I wonder he didn’t throw the label away and type another.”

“Precisely,” said Thorndyke. “And if we wish to find out why he did not, we have only to look at the back of the label. You see that the name of the firm, instead of being printed on the label itself in the usual manner, is printed on a separate slip of paper which is pasted on the label—a most foolish and clumsy arrangement, involving an immense waste of time. But if we look closely at the printed slip itself we perceive something still more remarkable; for that slip has been cut down to fit the label, and has been cut with a pair of scissors. The edges are not quite straight, and in one place the ‘overlap,’ which is so characteristic of the cut made with scissors, can be seen quite plainly.”

He handed the packet to me with a reading-lens, through which I could distinctly make out the points he had mentioned.

“Now I need not point out to you,” he continued, “that these slips would, ordinarily, have been trimmed by the printer to the correct size in his machine, which would leave an absolutely true edge; nor need I say that no sane business man would adopt such a device as this. The slip of paper has been cut with scissors to fit the label, and it has then been pasted on to the surface that it has been made to fit, when all this waste of time and trouble—which, in practice, means money—could have been saved by printing the name on the label itself.”

“Yes, that is so; but I still do not see why the fellow should not have thrown away this label and typed another.”

“Look at the slip again,” said Thorndyke. “It is faintly but evenly discoloured and, to me, has the appearance of having been soaked in water. Let us, for the moment, assume that it has been. That would look as if it had been removed from some other package, which again would suggest that the person using it had only the one slip, which he had soaked off the original package, dried, cut down and pasted on the present label. If he pasted it on before typing the address—which he would most probably have done—he might well be unwilling to risk destroying it by soaking it a second time.”

“You think, then, there is a suspicion that the package may have been tampered with?”

“There is no need to jump to conclusions,” replied Thorndyke. “I merely gave this case as an instance showing that careful examination of the outside of a package or letter may lead us to bestow a little extra attention on the contents. Now let us open it and see what those contents are.”

With a sharp knife he divided the outside cover, revealing a stout cardboard box wrapped in a number of advertisement sheets. The box, when the lid was raised, was seen to contain a single cigar—a large cheroot—packed in cotton wool.

“Yes; and another anomaly, at once, you see, which might have escaped our notice if we had not been on the qui vive.”

“As a matter of fact, I don’t see,” said I. “You will think me an awful blockhead, but I don’t perceive anything singular in a cigar manufacturer sending a sample cigar.”

“You read the label, I think?” replied Thorndyke. “However, let us look at one of these leaflets and see what they say. Ah! here we are: ‘Messrs. Bartlett and Sons, who own extensive plantations on the island of Cuba, manufacture their cigars exclusively from selected leaves grown by themselves.’ They would hardly make a Trichinopoly cheroot from leaf grown in the West Indies, so we have here a striking anomaly of an East Indian cigar sent to us by a West Indian grower.”

“And what do you infer from that?”

“Principally that this cigar—which, by the way, is an uncommonly fine specimen and which I would not smoke for ten thousand pounds—is deserving of very attentive examination.” He produced from his pocket a powerful doublet lens, with the aid of which he examined every part of the surface of the cigar, and finally, both ends.
“Look at the small end,” he said, handing me the cigar and the lens, “and tell me if you notice anything.”
I focussed the lens on the flush-cut surface of closely-rolled leaf, and explored every part of it minutely.

“It seems to me,” I said, “that the leaf is opened slightly in the centre, as if a fine wire had been passed up it.”

“So it appeared to me,” replied Thorndyke; “and, as we are in agreement so far, we will carry our investigations a step further.”

He laid the cigar down on the table, and, with the keen, thin-bladed penknife, neatly divided it lengthwise into two halves.

“Ecce signum!” exclaimed Thorndyke, as the two parts fell asunder; and for a few moments we stood silently regarding the dismembered cheroot. For, about half an inch from the small end, there appeared a little circular patch of white, chalky material which, by the even manner in which it was diffused among the leaf, had evidently been deposited from a solution.

“Our ingenious friend again, I surmise,” said Thorndyke at length, taking up one of the halves and examining the white patch through his lens. “A thoughtful soul, Jervis, and original too. I wish his talents could be applied in some other direction. I shall have to remonstrate with him if he becomes troublesome.”

“It is your duty to society, Thorndyke,” I exclaimed passionately, “to have this infernal, cold-blooded scoundrel arrested instantly. Such a man is a standing menace to the community. Do you really know who sent this thing?”

“I can form a pretty shrewd guess, which, however, is not quite the same thing. But, you see, he has not been quite so clever this time, for he has left one or two traces by which his identity might be ascertained.”

“Indeed! What traces has he left?”

“Aha! now there is a nice little problem for us to consider.” He settled himself in his easy chair and proceeded to fill his pipe with the air of a man who is about to discuss a matter of merely general interest.

“Let us consider what information this ingenious person has given us about himself. In the first place, he evidently has a strong interest in my immediate decease. Now, why should he feel so urgent a desire for my death? Can it be a question of property? Hardy; for I am far from a rich man, and the provisions of my will are known to me alone. Can it then be a question of private enmity or revenge? I think not. To the best of my belief I have no private enemies whatever. There remains only my vocation as an investigator in the fields of legal and criminal research. His interest in my death must, therefore, be connected with my professional activities. Now, I am at present conducting an exhumation which may lead to a charge of murder; but if I were to die to-night the inquiry would be carried out with equal efficiency by Professor Spicer or some other toxicologist. My death would not affect the prospects of the accused. And so in one or two other cases that I have in hand; they could be equally well conducted by someone else. The inference is that our friend is not connected with any of these cases, but that he believes me to possess some exclusive information concerning him—believes me to be the one person in the world who suspects and can convict him. Let us assume the existence of such a person—a person of whose guilt I alone have evidence. Now this person, being unaware that I have communicated my knowledge to a third party, would reasonably suppose that by making away with me he had put himself in a position of security.

“Here, then, is our first point. The sender of this offering is probably a person concerning whom I hold certain exclusive information.

“But see, now, the interesting corollary that follows from this. I, alone, suspect this person; therefore I have not published my suspicions, or others would suspect him too. Why, then, does he suspect me of suspecting him, since I have not spoken? Evidently, he too must be in possession of exclusive information. In other words, my suspicions are correct; for if they were not, he could not be aware of their existence.

“The next point is the selection of this rather unusual type of cigar. Why should he have sent a Trichinopoly instead of an ordinary Havana such as Bartletts actually manufacture? It looks as if he were aware of my peculiar predilection, and, by thus consulting my personal tastes, had guarded against the chance of my giving the cigar to some other person. We may, therefore, infer that our friend probably has some knowledge of my habits.

“The third point is, What is the social standing of this gentle stranger, whom we will call X? Now, Bartletts do not send their advertisements and samples to Thomas, Richard and Henry. They send, chiefly, to members of the professions and men of means and position. It is true that the original package might have been annexed by a clerk, office boy or domestic servant; but the probabilities are that X received the package himself, and this is borne out by the fact that he was able to obtain access to a powerful alkaloidal poison—such as this undoubtedly is.”

“In that case he would probably be a medical man or a chemist,” I suggested.

“Not necessarily,” replied Thorndyke. “The laws relating to poisons are so badly framed and administered that any well-to-do person, who has the necessary knowledge, can obtain almost any poison that he wants. But social position is an important factor, whence we may conclude that X belongs, at least, to the middle class.

“The fourth point relates to the personal qualities of X. Now it is evident, from this instance alone, that he is a man of exceptional intelligence, of considerable general information, and both ingenious and resourceful. This cigar device is not only clever and original, but it has been adapted to the special circumstances with remarkable forethought. Thus the cheroot was selected, apparently, for two excellent reasons: first, that it was the most likely form to be smoked by the
person intended, and second, that it did not require to have the end cut off—which might have led to a discovery of the poison. The plan also shows a certain knowledge of chemistry; the poison was not intended merely to be dissolved in the moisture of the mouth. The idea evidently was that the steam generated by the combustion of the leaf at the distal end, would condense in the cooler part of the cigar and dissolve the poison, and the solution would then be drawn into the mouth. Then the nature of the poison and certain similarities of procedure seem to identify X with the cyclist who used that ingenious bullet. The poison in this case is a white, non-crystalline solid; the poison contained in the bullet was a solution of a white, non-crystalline solid, which analysis showed to be the most poisonous of all alkaloids.

“The bullet was virtually a hypodermic syringe; the poison in this cigar has been introduced, in the form of an alcoholic or ethereal solution, by a hypodermic syringe. We shall thus be justified in assuming that the bullet and the cigar came from the same person; and, if this be so, we may say that X is a person of considerable knowledge, of great ingenuity and no mean skill as a mechanician—as shown by the manufacture of the bullet.

“These are our principal facts—to which we may add the surmise that he has recently purchased a second-hand Blickensderfer of the literary form or, at least, fitted with a literary typewheel.”

“I don’t quite see how you arrive at that,” I said, in some surprise.

“It is merely a guess, you know,” he replied, “though a probable one. In the first place he is obviously unused to typing, as the numerous mistakes show; therefore he has not had the machine very long. The type is that which is peculiar to the Blickensderfer, and, in one of the mistakes, an asterisk has been printed in place of a letter. But the literary typewheel is the only one that has the asterisk. As to the age of the machine, there are evident signs of wear, for some of the letters have lost their sharpness, and this is most evident in the case of those letters which are the most used—the ‘e’, you will notice, for instance, is much worn; and ‘e’ occurs more frequently than any other letter of the alphabet. Hence the machine, if recently purchased, was bought second-hand.”

“But,” I objected, “it may not have been his own machine at all.”

“That is quite possible,” answered Thorndyke, “though, considering the secrecy that would be necessary, the probabilities are in favour of his having bought it. But, in any case, we have here a means of identifying the machine, should we ever meet with it.”

He picked up the label and handed it to me, together with his pocket lens.

“Look closely at the ‘e’ that we have been discussing; it occurs five times; in ‘Thorndyke,’ in ‘Bench,’ in ‘Inner,’ and in ‘Temple.’ Now in each case you will notice a minute break in the loop, just at the summit. That break corresponds to a tiny dent in the type—caused, probably, by its striking some small, hard object.”

“I can make it out quite distinctly,” I said, “and it should be a most valuable point for identification.”

“It should be almost conclusive,” Thorndyke replied, “especially when joined to other facts that would be elicited by a search of his premises. And now let us just recapitulate the facts which our friend X has placed at our disposal.

“First: X is a person concerning whom I possess certain exclusive information.

“Second: He has some knowledge of my personal habits.

“Third: He is a man of some means and social position.

“Fourth: He is a man of considerable knowledge, ingenuity and mechanical skill.

“Fifth: He has probably purchased, quite recently, a second-hand ‘Blick’ fitted with a literary typewheel.

“Sixth: That machine, whether his own or some other person’s property, can be identified by a characteristic mark on the small ‘e.’

“If you will note down those six points and add that X is probably an expert cyclist and a fairly good shot with a rifle, you may possibly be able, presently, to complete the equation, X = ?”

“I am afraid,” I said, “I do not possess the necessary data; but I suspect you do, and if it is so, I repeat that it is your duty to society—to say nothing of your clients, whose interests would suffer by your death—to have this fellow laid by the heels before he does any mischief.”

“Yes; I shall have to interfere if he becomes really troublesome, but I have reasons for wishing to leave him alone at present.”

“You do really know who he is, then?”

“Well, I think I can solve the equation that I have just offered to you for solution. You see, I have certain data, as you suggest, which you do not possess. There is, for instance, a certain ingenious gentleman concerning whom I hold what I believe to be exclusive information, and my knowledge of him does not make it appear unlikely that he might be the author of these neat little plans.”

“I am much impressed,” I said, as I put away my notebook, after having jotted down the points that Thorndyke had advised me to consider—“I am much impressed by your powers of observation and your capacity for reasoning from apparently trivial data; but I do not see, even now, why you viewed that cigar with such immediate and decided suspicion. There was nothing actually to suggest the existence of poison in it, and yet you seemed to form the suspicion at once and to
thoughts, at least from our conversation. I cigar with its accompanying report on the nature of the poison. After that we shall act in me to the hospital and see me perhaps more successful, scheme for your destruction?”

“going to do? Is the to be put overshadowed him, and I came back, once more, to my original question.

“And now, Thorndyke,” I said, “that you have penetrated both the motives and the disguise of this villain, what are you going to do? Is he to be put safely under lock and key, or is he to be left in peace and security to plan some other, and perhaps more successful, scheme for your destruction?”

“For the present,” replied Thorndyke, “I am going to put these things in a place of safety. To-morrow you shall come with me to the hospital and see me place the ends of the cigar in the custody of Dr. Chandler, who will make an analysis and report on the nature of the poison. After that we shall act in whatever way seems best.”

Unsatisfactory as this conclusion appeared, I knew it was useless to raise further objections, and, accordingly, when the cigar with its accompanying papers and wrappings had been deposited in a drawer, we dismissed it, if not from our thoughts, at least from our conversation.
XIV. — A STARTLING DISCOVERY

THE morning of the trial, so long looked forward to, had at length arrived, and the train of events which it has been my business to chronicle in this narrative was now fast drawing to an end. To me those events had been in many ways of the deepest moment. Not only had they transported me from a life of monotonous drudgery into one charged with novelty and dramatic interest; not only had they introduced me to a renascence of scientific culture and revived under new conditions my intimacy with the comrade of my student days; but, far more momentous than any of these, they had given me the vision—all too fleeting—of happiness untold, with the reality of sorrow and bitter regret that promised to be all too enduring.

Whence it happened that on this morning my thoughts were tinged with a certain greyness. A chapter in my life that had been both bitter and sweet was closing, and already I saw myself once more an Ishmaelite and a wanderer among strangers.

This rather egotistical frame of mind, however, was soon dispelled when I encountered Polton, for the little man was in a veritable twitter of excitement at the prospect of witnessing the clearing up of the mysteries that had so severely tried his curiosity; and even Thorndyke, beneath his habitual calm, showed a trace of expectancy and pleasurable anticipation. "I have taken the liberty of making certain little arrangements on your behalf," he said, as we sat at breakfast, "of which I hope you will not disapprove. I have written to Mrs. Hornby, who is one of the witnesses, to say that you will meet her at Mr. Lawley's office and escort her and Miss Gibson to the court. Walter Hornby may be with them, and, if he is, you had better leave him, if possible, to come on with Lawley."

"You will not come to the office, then?"

"No, I shall go straight to the court with Anstey. Besides, I am expecting Superintendent Miller from Scotland Yard, who will probably walk down with us."

"I am glad to hear that," I said; "for I have been rather uneasy at the thought of your mixing in the crowd without some kind of protection."

"Well, you see that I am taking precautions against the assaults of the too-ingenious X, and, to tell the truth—and also to commit a flagrant bull—I should never forgive myself if I allowed him to kill me before I had completed Reuben Hornby's defence. Ah, here is Polton—that man is on wires this morning; he has been wandering in and out of the rooms ever since he came, like a cat in a new house."

"It's quite true, sir," said Polton, smiling and unabashed, "so it's no use denying it. I have come to ask what we are going to take with us to the court."

"You will find a box and a portfolio on the table in my room," replied Thorndyke. "We had better also take a microscope and the micrometers, though we are not likely to want them; that is all, I think."

"A box and a portfolio," repeated Polton in a speculative tone. "Yes, sir, I will take them with me." He opened the door and was about to pass out, when, perceiving a visitor ascending the stairs, he turned back.

"Here's Mr. Miller, from Scotland Yard, sir; shall I show him in?"

"Yes, do." He rose from his chair as a tall, military-looking man entered the room and saluted, casting, at the same time, an inquiring glance in my direction.

"Good morning, Doctor," he said briskly. "I got your letter and couldn't make such of it, but I have brought down a couple of plain-clothes men and a uniform man, as you suggested. I understand you want a house watched?"

"Yes, and a man, too. I will give you the particulars presently—that is, if you think you can agree to my conditions."

"That I act entirely on my own account and make no communication to anybody? Well, of course, I would rather you gave me all the facts and let me proceed in the regular way; but if you make conditions I have no choice but to accept them, seeing that you hold the cards."

Perceiving that the matter in hand was of a confidential nature, I thought it best to take my departure, which I accordingly did, as soon as I had ascertained that it wanted yet half-an-hour to the time at which Mrs. Hornby and Juliet were due at the lawyer's office.

Mr. Lawley received me with stiffness that bordered on hostility. He was evidently deeply offended at the subordinate part that he had been compelled to play in the case, and was at no great pains to conceal the fact.

"I am informed," said he, in a frosty tone, when I had explained my mission, "that Mrs. Hornby and Miss Gibson are to meet you here. The arrangement is none of my making; none of the arrangements in this case are of my making. I have been treated throughout with a lack of ceremony and confidence that is positively scandalous. Even now, I—the solicitor for the defence—am completely in the dark as to what defence is contemplated, though I fully expect to be involved in some ridiculous fiasco. I only trust that I may never again be associated with any of your hybrid practitioners. Ne sutor ultra crepidam, sir, is an excellent motto; let the medical cobbler stick to his medical last."

"It remains to be seen what kind of boot he can turn out on the legal last," I retorted.
“That is so,” he rejoined; “but I hear Mrs. Hornby’s voice in the outer office, and as neither you nor I have any time to waste in idle talk, I suggest that you make your way to the court without delay. I wish you good morning!”

Acting on this very plain hint, I retired to the clerks’ office, where I found Mrs. Hornby and Juliet, the former undisguisedly tearful and terrified, and the latter calm, though pale and agitated.

“We had better start at once,” I said, when we had exchanged greetings. “Shall we take a cab, or walk?”

“I think we will walk, if you don’t mind,” said Juliet. “Mrs. Hornby wants to have a few words with you before we go into court. You see, she is one of the witnesses, and she is terrified lest she should say something damaging to Reuben.”

“By whom was the subpoena served?” I asked.

“Mr. Lawley sent it,” replied Mrs. Hornby, “and I went to see him about it the very next day, but he wouldn’t tell me anything—he didn’t seem to know what I was wanted for, and he wasn’t at all nice—not at all.”

“I expect your evidence will relate to the ‘Thumbograph,’” I said. “There is really nothing else in connection with the case that you have any knowledge of.”

“That is just what Walter said,” exclaimed Mrs. Hornby. “I went to his rooms to talk the matter over with him. He is very upset about the whole affair, and I am afraid he thinks very badly of poor Reuben’s prospects. I only trust he may be wrong! Oh dear! What a dreadful thing it is, to be sure!” Here the poor lady halted to mop her eyes elaborately, to the surprise and manifest scorn of a passing errand boy.

“He was very thoughtful and sympathetic—Walter, I mean, you know,” pursued Mrs. Hornby, “and most helpful. He asked me all I knew about that horrid little book, and took down my answers in writing. Then he wrote out the questions I was likely to be asked, with my answers, so that I could read them over and get them well into my head. Wasn’t it good of him! And I made him print them with his machine so that I could read them without my glasses, and he did it beautifully. I have the paper in my pocket now.”

“I didn’t know Mr. Walter went in for printing,” I said. “Has he a regular printing press?”

“It isn’t a printing press exactly,” replied Mrs. Hornby; “it is a small thing with a lot of round keys that you press down—Dickensblerfer, I think it is called—ridiculous name, isn’t it? Walter bought it from one of his literary friends about a week ago; but he is getting quite clever with it already, though he does make a few mistakes still, as you can see.”

She halted again, and began to search for the opening of a pocket which was hidden away in some occult recess of her clothing, all unconscious of the effect that her explanation had produced on me. For, instantly, as she spoke, there flashed into my mind one of the points that Thorndyke had given me for the identification of the mysterious X. “He has probably purchased, quite recently, a second-hand Blicksenderfer, fitted with a literary typewriter.” The coincidence was striking and even startling, though a moment’s reflection convinced me that it was nothing more than a coincidence; for there must be hundreds of second-hand “Blicks” on the market, and, as to Walter Hornby, he certainly could have no quarrel with Thorndyke, but would rather be interested in his preservation on Reuben’s account.

These thoughts passed through my mind so rapidly that by the time Mrs. Hornby had run her pocket to earth I had quite recovered from the momentary shock.

“Ah! here it is,” she exclaimed triumphantly, producing an obese Morocco purse. “I put it in here for safety, knowing how liable one is to get one’s pocket picked in these crowded London streets.” She opened the bulky receptacle and drew it out after the manner of a concertina, exhibiting multitudinous partitions, all stuffed with pieces of paper, coils of tape and sewing silk, buttons, samples of dress materials and miscellaneous rubbish, mingled indiscriminately with gold, silver, and copper coins.

“Now just run your eye through that, Dr. Jervis,” she said, handing me a folded paper, “and give me your advice on my answers.”

I opened the paper and read: “The Committee of the Society for the Protection of Paralysed Idiots, in submitting this—”

“Oh! that isn’t it; I have given you the wrong paper. How silly of me! That is the appeal of—you remember, Juliet, dear, that troublesome person—I had, really, to be quite rude, you know, Dr. Jervis; I had to tell him that charity begins at home, although, thank Heaven! none of us are paralysed, but we must consider our own, mustn’t we? And then—”

“Do you think this is the one, dear?” interposed Juliet, in whose pale cheek the ghost of a dimple had appeared. “It looks cleaner than most of the others.”

She selected a folded paper from the purse which Mrs. Hornby was holding with both hands extended to its utmost, as though she were about to produce a burst of music, and, opening it, glanced at its contents.

“Yes, this is your evidence,” she said, and passed the paper to me.

I took the document from her hand and, in spite of the conclusion at which I had arrived, examined it with eager curiosity. And at the very first glance I felt my head swim and my heart throb violently. For the paper was headed: “Evidence respecting the Thumbograph,” and in every one of the five small “e’s” that occurred in that sentence I could see plainly by the strong out-door light a small break or interval in the summit of the loop.

I was thunderstruck.
One coincidence was quite possible and even probable; but the two together, and the second one of so remarkable a character, were beyond all reasonable limits of probability. The identification did not seem to admit of a doubt, and yet—

“Our legal adviser appears to be somewhat preoccupied,” remarked Juliet, with something of her old gaiety of manner; and, in fact, though I held the paper in my hand, my gaze was fixed unmeaningly on an adjacent lamp-post. As she spoke, I pulled myself together, and, scanning the paper hastily, was fortunate enough to find in the first paragraph matter requiring comment.

“I observe, Mrs. Hornby,” I said, “that in answer to the first question, ‘Whence did you obtain the ‘Thumbograph’?’ you say, ‘I do not remember clearly; I think I must have bought it at a railway bookstall.’ Now I understood that it was brought home and given to you by Walter himself.”

“That was what I thought,” replied Mrs. Hornby, “but Walter tells me that it was not so, and, of course, he would remember better than I should.”

“But, my dear aunt, I am sure he gave it to you,” interposed Juliet. “Don’t you remember? It was the night the Colleys came to dinner, and we were so hard pressed to find amusement for them, when Walter came in and produced the ‘Thumbograph.’”

“Yes, I remember quite well now,” said Mrs. Hornby. “How fortunate that you reminded me. We must alter that answer at once.”

“If I were you, Mrs. Hornby,” I said, “I would disregard this paper altogether. It will only confuse you and get you into difficulties. Answer the questions that are put, as well as you can, and if you don’t remember, say so.”

“Yes, that will be much the wisest plan,” said Juliet. “Let Dr. Jervis take charge of the paper and rely on your own memory.”

“Very well, my dear,” replied Mrs. Hornby, “I will do what you think best, and you can keep the paper, Dr. Jervis, or throw it away.”

I slipped the document into my pocket without remark, and we proceeded on our way, Mrs. Hornby babbling inconsequently, with occasional outbursts of emotion, and Juliet silent and abstracted. I struggled to concentrate my attention on the elder lady’s conversation, but my thoughts continually reverted to the paper in my pocket, and the startling solution that it seemed to offer of the mystery of the poisoned cigar.

Could it be that Walter Hornby was in reality the miscreant X? The thing seemed incredible, for, hitherto, no shadow of suspicion had appeared to fall on him. And yet there was no denying that his description tallied in a very remarkable manner with that of the hypothetical X. He was a man of some means and social position; he was a man of considerable knowledge and mechanical skill, though as to his ingenuity I could not judge. He had recently bought a second-hand Blickensderfer which probably had a literary typewheel, since it was purchased from a literary man; and that machine showed the characteristic mark on the small “e.” The two remaining points, indeed, were not so clear. Obviously I could form no opinion as to whether or not Thorndyke held any exclusive information concerning him, and, with reference to his knowledge of my friend’s habits, I was at first inclined to be doubtful until I suddenly recalled, with a pang of remorse and self-accusation, the various details that I had communicated to Juliet and that she might easily, in all innocence, have handed on to Walter. I had, for instance, told her of Thorndyke’s preference for the Trichinopoly cheroot, and if Mrs. Hornby could have obtained access to this typewriting machine; and if Mrs. Hornby could do so, why not John Hornby? The description would, for the most part, fit the elder man as well as the younger, though I had no evidence of his possessing any special mechanical skill; but my suspicions had already fastened upon him, and I remembered that Thorndyke had by no means rejected my theory which connected him with the crime.

At this point, my reflections were broken in upon by Mrs. Hornby, who grasped my arm and uttered a deep groan. We had reached the corner of the Old Bailey, and before us were the frowning walls of Newgate. Within those walls, I knew—though I did not mention the fact—that Reuben Hornby was confined with the other prisoners who were awaiting their trial; and a glance at the massive masonry, stained to a dingy gray by the grime of the city, put an end to my speculations and brought me back to the drama that was so nearing approaching its climax.

Down the old thoroughfare, crowded with so many memories of hideous tragedy; by the side of the gloomy prison; past the debtors’ door with its forbidding spiked wicket; past the gallows gate with its festoons of fetters; we walked in silence until we reached the entrance to the Sessions House.

Here I was not a little relieved to find Thorndyke on the look-out for us, for Mrs. Hornby, in spite of really heroic efforts to control her emotion, was in a state of impending hysteria, while Juliet, though outwardly calm and composed, showed by the waxen pallor of her cheeks and a certain wildness of her eyes that all her terror was reviving; and I was glad that they were spared the unpleasantness of contact with the policemen who guarded the various entrances.

“We must be brave,” said Thorndyke gently, as he took Mrs. Hornby’s hand, “and show a cheerful face to our friend who...
has so much to bear and who bears it so patiently. A few more hours, and I hope we shall see restored, not only his liberty, but his honour. Here is Mr. Anstey, who, we trust, will be able to make his innocence apparent.”

Anstey, who, unlike Thorndyke, had already donned his wig and gown, bowed gravely, and, together, we passed through the mean and grimy portals into a dark hall. Policemen in uniform and unmistakable detectives stood about the various entries, and little knots of people, evil-looking and unclean for the most part, lurked in the background or sat on benches and diffused through the stale, musty air that distinctive but indescribable odour that clings to police vans and prison reception rooms; an odour that, in the present case, was pleasantly mingled with the suggestive aroma of disinfectants. Through the unsavoury throng we hurried, and up a staircase to a landing from which several passages diverged. Into one of these passages—a sort of “dark entry,” furnished with a cage-like gate of iron bars—we passed to a black door, on which was painted the inscription, “Old Court. Counsel and clerks.”

Anstey held the door open for us, and we passed through into the court, which at once struck me with a sense of disappointment. It was smaller than I had expected, and plain and mean to the point of sordidness. The woodwork was poor, thinly disguised by yellow graining, and slinky with dirt wherever a dirty hand could reach it. The walls were distempered a pale, greenish grey; the floor was of bare and dirty planking, and the only suggestions of dignity or display were those offered by the canopy over the judge’s seat—lined with scarlet baize and surmounted by the royal arms—the scarlet cushions of the bench, and the large, circular clock in the gallery, which was embellished with a gilded border and asserted its importance by a loud, aggressive tick.

Following Anstey and Thorndyke into the well of the court, we were ushered into one of the seats reserved for counsel—the third from the front—where we sat down and looked about us, while our two friends seated themselves in the front bench next to the central table. Here, at the extreme right, a barrister—presumably the counsel for the prosecution—was already in his place and absorbed in the brief that lay on the desk before him. Straight before us were the seats for the jury, rising one above the other, and at their side the witness-box. Above us on the right was the judge’s seat, and immediately below it a structure somewhat resembling a large pew or a counting-house desk, surmounted by a brass rail, in which a person in a grey wig—the clerk of the court—was mending a quill pen. On our left rose the dock—suggestively large and roomy—enclosed at the sides with high glazed frames; and above it, near the ceiling, was the spectators’ gallery.

“What a hideous place!” exclaimed Juliet, who separated me from Mrs. Hornby. “And how sordid and dirty everything looks!”

“Yes,” I answered. “The uncleanness of the criminal is not confined to his moral being; wherever he goes, he leaves a trail of actual, physical dirt. It is not so long ago that the dock and the bench alike used to be strewn with medicinal herbs, and I believe the custom still survives of furnishing the judge with a nosegay as a preventive of jail-fever.”

“And to think that Reuben should be brought to a place like this!” Juliet continued bitterly; “to be herded with such people as we saw downstairs!”

She sighed and looked round at the benches that rose behind us, where a half-dozen reporters were already seated and apparently in high spirits at the prospect of a sensational case.

Our conversation was now interrupted by the clatter of feet on the gallery stairs, and heads began to appear over the wooden parapet. Several junior counsel filed into the seats in front of us; Mr. Lawley and his clerk entered the attorney’s bench; the ushers took their stand below the jury-box; a police officer seated himself at a desk in the dock; and inspectors, detectives and miscellaneous officers began to gather in the entries or peer into the court through the small glazed openings in the doors.

XV. — THE FINGER-PRINT EXPERTS

THE hum of conversation that had been gradually increasing as the court filled suddenly ceased. A door at the back of the dais was flung open; counsel, solicitors, and spectators alike rose to their feet; and the judge entered, closely followed by the Lord Mayor, the sheriff, and various civic magnates, all picturesque and gorgeous in their robes and chains of office. The Clerk of Arraigns took his place behind his table under the dais; the counsel suspended their conversation and fingered their briefs; and, as the judge took his seat, lawyers, officials, and spectators took their seats, and all eyes were turned towards the dock.

A few moments later Reuben Hornby appeared in the enclosure in company with a warder, the two rising, apparently, from the bowels of the earth, and, stepping forward to the bar, stood with a calm and self-possessed demeanour, glancing somewhat curiously around the court. For an instant his eye rested upon the group of friends and well-wishers seated behind the counsel, and the faintest trace of a smile appeared on his face; but immediately he turned his eyes away and never again throughout the trial looked in our direction.

The Clerk of Arraigns now rose and, reading from the indictment which lay before him on the table, addressed the prisoner—

“Reuben Hornby, you stand indicted for that you did, on the ninth or tenth day of March, feloniously steal a parcel of diamonds of the goods and chattels of John Hornby. Are you guilty or not guilty?”

“Not guilty,” replied Reuben.
The Clerk of Arraigns, having noted the prisoner’s reply, then proceeded—

“The gentlemen whose names are about to be called will form the jury who are to try you. If you wish to object to any of them, you must do so as each comes to the book to be sworn, and before he is sworn. You will then be heard.”

In acknowledgment of this address, which was delivered in clear, ringing tones, and with remarkable distinctness, Reuben bowed to the clerk, and the process of swearing-in the jury was commenced, while the counsel opened their briefs and the judge conversed facetiously with an official in a fur robe and a massive neck chain.

Very strange, to unaccustomed eyes and ears, was the effect of this function—half solemn and half grotesque, with an effect intermediate between that of a religious rite and that of a comic opera. Above the half-suppressed hum of conversation the clerk’s voice arose at regular intervals, calling out the name of one of the jurymen, and, as its owner stood up, the court usher, black-gowned and sacerdotal of aspect, advanced and proffered the book. Then, as the juryman took the volume in his hand, the voice of the usher resounded through the court like that of a priest intoning some refrain or antiphon—an effect that was increased by the rhytmical and archaic character of the formula—

“Samuel Seppings!”

A stolid-looking working-man rose and, taking the Testament in his hand, stood regarding the usher while that official sang out in a solemn monotone—

“You shall well and truly try and true deliverance make between our Sovereign Lord the King and the prisoner at the bar, whom you shall have in charge, and a true verdict give according to the evidence. So help you God!”

“James Piper!” Another juryman rose and was given the Book to hold; and again the monotonous sing-song arose—

“You shall well and truly try and true deliverance make, etc.”

“I shall scream aloud if that horrible chant goes on much longer,” Juliet whispered. “Why don’t they all swear at once and have done with it?”

“That would not meet the requirements,” I answered. “However, there are only two more, so you must have patience.”

“And you will have patience with me, too, won’t you? I am horribly frightened. It is all so solemn and dreadful.”

“You must try to keep up your courage until Dr. Thorndyke has given his evidence,” I said. “Remember that, until he has spoken, everything is against Reuben; so be prepared.”

“I will try,” she answered meekly; “but I can’t help being terrified.”

The last of the jurymen was at length sworn, and when the clerk had once more called out the names one by one, the usher counting loudly as each man answered to his name, the latter officer turned to the Court and spectators, and proclaimed in solemn tones—

“If anyone can inform my Lords the King’s justices, the King’s attorney-general, or the King’s serjeant, ere this inquest be now taken between our Sovereign Lord the King and the prisoner at the bar, of any treason, murder, felony or misdemeanour, committed or done by him, let him come forth and he shall be heard; for the prisoner stands at the bar upon his deliverance.”

This proclamation was followed by a profound silence, and after a brief interval the Clerk of Arraigns turned towards the jury and addressed them collectively—

“Gentlemen of the jury, the prisoner at the bar stands indicted by the name of Reuben Hornby, for that he, on the ninth or tenth of March, feloniously did steal, take and carry away a parcel of diamonds of the goods of John Hornby. To this indictment he has pleaded that he is not guilty, and your charge is to inquire whether he be guilty or not and to hearken to the evidence.”

When he had finished his address the clerk sat down, and the judge, a thin-faced, hollow-eyed elderly man, with bushy grey eyebrows and a very large nose, looked attentively at Reuben for some moments over the tops of his gold-rimmed pince-nez. Then he turned towards the counsel nearest the bench and bowed slightly.

The barrister bowed in return and rose, and for the first time I obtained a complete view of Sir Hector Trumpler, K.C., the counsel for the prosecution. His appearance was not prepossessing nor—though he was a large man and somewhat florid as to his countenance—particularly striking, except for a general air of untidiness. His gown was slipping off one shoulder, his wig was perceptibly awry, and his pince-nez threatened every moment to drop from his nose.

“The case that I have to present to you, my lord and gentlemen of the jury,” he began in a clear, though unmusical voice, “is one the like of which is but too often met with in this court. It is one in which we shall see unbounded trust met by treacherous deceit, in which we shall see countless benefactions rewarded by the basest ingratitude, and in which we shall witness the deliberate renunciation of a life of honourable effort in favour of the tortuous and precarious ways of the criminal. The facts of the case are briefly as follows: The prosecutor in this case—most unwilling prosecutor, gentlemen—is Mr. John Hornby, who is a metallurgist and dealer in precious metals. Mr. Hornby has two nephews, the orphan sons of his two elder brothers, and I may tell you that since the decease of their parents he has acted the part of a father to both of them. One of these nephews is Mr. Walter Hornby, and the other is Reuben Hornby, the prisoner at the bar. Both of these nephews were received by Mr. Hornby into his business with a view to their succeeding him when he should retire, and
both, I need not say, occupied positions of trust and responsibility.

"Now, on the evening of the ninth of March there was delivered to Mr. Hornby a parcel of rough diamonds of which one of his clients asked him to take charge pending their transfer to the brokers. I need not burden you with irrelevant details concerning this transaction. It will suffice to say that the diamonds, which were of the aggregate value of about thirty thousand pounds, were delivered to him, and the unopened package deposited by him in his safe, together with a slip of paper on which he had written in pencil a memorandum of the circumstances. This was on the evening of the ninth of March, as I have said. Having deposited the parcel, Mr. Hornby locked the safe, and shortly afterwards left the premises and went home, taking the keys with him.

"On the following morning, when he unlocked the safe, he perceived with astonishment and dismay that the parcel of diamonds had vanished. The slip of paper, however, lay at the bottom of the safe, and on picking it up Mr. Hornby perceived that it bore a smear of blood, and in addition, the distinct impression of a human thumb. On this he closed and locked the safe and sent a note to the police station, in response to which a very intelligent officer—Inspector Sanderson—came and made a preliminary examination. I need not follow the case further, since the details will appear in the evidence, but I may tell you that, in effect, it has been made clear, beyond all doubt, that the thumb-print on that paper was the thumb-print of the prisoner, Reuben Hornby."

He paused to adjust his glasses, which were in the very act of falling from his nose, and hitch up his gown, while he took a leisurely survey of the jury, as though he were estimating their impressionability. At this moment I observed Walter Hornby enter the court and take up a position at the end of our bench nearest the door; and, immediately after, Superintendent Miller came in and seated himself on one of the benches opposite.

"The first witness whom I shall call," said Sir Hector Trumpler, "is John Hornby."

Mr. Hornby, looking wild and agitated, stepped into the witness-box, and the usher, having handed him the Testament, sang out—

"The evidence you shall give to the court and jury sworn, between our Sovereign Lord the King and the prisoner at the bar shall be the truth, the whole truth, and nothing but the truth; so help you God!"

Mr. Hornby kissed the Book, and, casting a glance of unutterable misery at his nephew, turned towards the counsel.

"Your name is John Hornby, is it not?" asked Sir Hector.

"It is."

"And you occupy premises in St. Mary Axe?"

"Yes. I am a dealer in precious metals, but my business consists principally in the assaying of samples of ore and quartz and bars of silver and gold."

"Do you remember what happened on the ninth of March last?"

"Perfectly. My nephew Reuben—the prisoner—delivered to me a parcel of diamonds which he had received from the purser of the Elmina Castle, to whom I had sent him as my confidential agent. I had intended to deposit the diamonds with my banker, but when the prisoner arrived at my office, the banks were already closed, so I had to put the parcel, for the night, in my own safe. I may say that the prisoner was not in any way responsible for the delay."

"You are not here to defend the prisoner," said Sir Hector. "Answer my questions and make no comments, if you please. Was anyone present when you placed the diamonds in the safe?"

"No one was present but myself."

"I did not ask if you were present when you put them in," said Sir Hector (whereupon the spectators sniggered and the judge smiled indulgently). "What else did you do?"

"I wrote in pencil on a leaf of my pocket memorandum block, 'Handed in by Reuben at 7.3 p.m., 9.3.01,’ and initialled it. Then I tore the leaf from the block and laid it on the parcel, after which I closed the safe and locked it."

"How soon did you leave the premises after this?"

"Almost immediately. The prisoner was waiting for me in the outer office—"

"Never mind where the prisoner was; confine your answers to what is asked. Did you take the keys with you?"

"Yes."

"When did you next open the safe?"

"On the following morning at ten o’clock."

"Was the safe locked or unlocked when you arrived?"

"It was locked. I unlocked it."

"Did you notice anything unusual about the safe?"

"No."
“Had the keys left your custody in the interval?”
“No. They were attached to a key-chain, which I always wear.”
“Are there any duplicates of those keys—the keys of the safe, I mean.”
“No, there are no duplicates.”
“Have the keys ever gone out of your possession?”
“Yes. If I have had to be absent from the office for a considerable time, it has been my custom to hand the keys to one of my nephews, whichever has happened to be in charge at the time.”
“And never to any other person?”
“Never to any other person.”
“What did you observe when you opened the safe?”
“I observed that the parcel of diamonds had disappeared.”
“Did you notice anything else?”
“Yes. I found the leaf from my memorandum block lying at the bottom of the safe. I picked it up and turned it over, and then saw that there were smears of blood on it and what looked like the print of a thumb in blood. The thumb-mark was on the under-surface, as the paper lay at the bottom of the safe.”
“What did you do next?”
“I closed and locked the safe, and sent a note to the police station saying that a robbery had been committed on my premises.”
“You have known the prisoner several years, I believe?”
“Yes; I have known him all his life. He is my eldest brother’s son.”
“Then you can tell us, no doubt, whether he is left-handed or right-handed?”
“I should say he was ambidextrous, but he uses his left hand by preference.”
“A fine distinction, Mr. Hornby; a very fine distinction. Now tell me, did you ascertain beyond all doubt that the diamonds were really gone?”
“Yes; I examined the safe thoroughly, first by myself and afterwards with the police. There was no doubt that the diamonds had really gone.”
“When the detective suggested that you should have the thumb-prints of your two nephews taken, did you refuse?”
“I refused.”
“Why did you refuse?”
“Because I did not choose to subject my nephews to the indignity. Besides, I had no power to make them submit to the proceeding.”
“Had you any suspicions of either of them?”
“I had no suspicions of anyone.”
“Kindly examine this piece of paper, Mr. Hornby,” said Sir Hector, passing across a small oblong slip, “and tell us if you recognise it.”
Mr. Hornby glanced at the paper for a moment, and then said—
“This is the memorandum slip that I found lying at the bottom of the safe.”
“How do you identify it?”
“By the writing on it, which is in my own hand, and bears my initials.”
“Is it the memorandum that you placed on the parcel of diamonds?”
“Yes.”
“Was there any thumb-mark or blood-smear on it when you placed it in the safe?”
“No.”
“Was it possible that there could have been any such marks?”
“Quite impossible. I tore it from my memorandum block at the time I wrote upon it.”
“Very well.” Sir Hector Trumper sat down, and Mr. Anstey stood up to cross-examine the witness.
“You have told us, Mr. Hornby,” said he, “that you have known the prisoner all his life. Now what estimate have you formed of his character?”
“I have always regarded him as a young man of the highest character—honourable, truthful, and in every way trustworthy. I have never, in all my experience of him, known him to deviate a hair’s-breadth from the strictest honour and honesty of conduct.”

“You regarded him as a man of irreproachable character. Is that so?”

“That is so; and my opinion of him is unchanged.”

“Has he, to your knowledge, any expensive or extravagant habits?”

“No. His habits are simple and rather thrifty.”

“Have you ever known him to bet, gamble, or speculate?”

“Never.”

“Has he ever seemed to be in want of money?”

“No. He has a small private income, apart from his salary, which I know he does not spend, since I have occasionally employed my broker to invest his savings.”

“Apart from the thumb-print which was found in the safe, are you aware of any circumstances that would lead you to suspect the prisoner of having stolen the diamonds?”

“None whatever.”

Mr. Anstey sat down, and as Mr. Hornby left the witness-box, mopping the perspiration from his forehead, the next witness was called.

“Inspector Sanderson!”

The dapper police officer stepped briskly into the box, and having been duly sworn, faced the prosecuting counsel with the air of a man who was prepared for any contingency.

“Do you remember,” said Sir Hector, after the usual preliminaries had been gone through, “what occurred on the morning of the tenth of March?”

“Yes. A note was handed to me at the station at 10.23 a.m. It was from Mr. John Hornby, and stated that a robbery had occurred at his premises in St. Mary Axe. I went to the premises and arrived there at 10.31 a.m. There I saw the prosecutor, Mr. John Hornby, who told me that a parcel of diamonds had been stolen from the safe. At his request I examined the safe. There were no signs of its having been forced open; the locks seemed to be quite uninjured and in good order. Inside the safe, on the bottom, I found two good-sized drops of blood. At this request I examined the safe.

“Is this the paper?” asked the counsel, passing a small slip across to the witness.

“Yes,” replied the inspector, after a brief glance at the document.

“What did you do next?”

“I sent a message to Scotland Yard acquainting the Chief of the Criminal Investigation Department with the facts, and then went back to the station. I had no further connection with the case.”

Sir Hector sat down, and the judge glanced at Anstey.

“You tell us,” said the latter, rising, “that you observed two good-sized drops of blood on the bottom of the safe. Did you notice the condition of the blood, whether moist or dry?”

“The blood looked moist, but I did not touch it. I left it undisturbed for the detective officers to examine.”

The next witness called was Sergeant Bates, of the Criminal Investigation Department. He stepped into the box with the same ready, business-like air as the other officer, and, having been sworn, proceeded to give his evidence with a fluency that suggested careful preparation, holding an open notebook in his hand but making no references to it.

“Oh the tenth of March, at 12.8 p.m., I received instructions to proceed to St. Mary Axe to inquire into a robbery that had taken place there. Inspector Sanderson’s report was handed to me, and I read it in the cab on my way to the premises. On arriving at the premises at 12.30 p.m., I examined the safe carefully. It was quite uninjured, and there were no marks of any kind upon it. I tested the locks and found them perfect; there were no marks or indications of any picklock having been used. On the bottom of the inside I observed two rather large drops of a dark fluid. I took up some of the fluid on a piece of paper and found it to be blood. I also found, in the bottom of the safe, the burnt head of a wax match, and, on searching the floor of the office, I found, close by the safe, a used wax match from which the head had fallen. I also found a slip of paper which appeared to have been torn from a perforated block. On it was written in pencil, ‘Handed in by Reuben at 7.3 p.m. 9.3.01. J.H.’ There were two smears of blood on the paper and the impression of a human thumb in blood. I took possession of the paper in order that it might be examined by the experts. I inspected the office doors and the outer door of the premises, but found no signs of forcible entrance on any of them. I questioned the housekeeper, but obtained no information from him. I then returned to headquarters, made my report and handed the paper with the marks on it to the Superintendent.”
“Is this the paper that you found in the safe?” asked the counsel, once more handing the leaflet across.

“Yes; this is the paper.”

“What happened next?”

“The following afternoon I was sent for by Mr. Singleton, of the Finger-print Department. He informed me that he had gone through the files and had not been able to find any thumb-print resembling the one on the paper, and recommended me to endeavour to obtain prints of the thumbs of any persons who might have been concerned in the robbery. He also gave me an enlarged photograph of the thumb-print for reference if necessary. I accordingly went to St. Mary Axe and had an interview with Mr. Hornby, when I requested him to allow me to take prints of the thumbs of all the persons employed on the premises, including his two nephews. This he refused, saying that he distrusted finger-prints and that there was no suspicion of anyone on the premises. I asked if he would allow his nephews to furnish their thumb-prints privately, to which he replied, ‘Certainly not.’”

“Had you then any suspicion of either of the nephews?”

“I thought they were both open to some suspicion. The safe had certainly been opened with false keys, and as they had both had the real keys in their possession it was possible that one of them might have taken impressions in wax and made counterfeit keys.”

“Yes.”

“I called on Mr. Hornby several times and urged him, for the sake of his nephews’ reputations, to sanction the taking of the thumb-prints; but he refused very positively and forbade them to submit, although I understood that they were both willing. It then occurred to me to try if I could get any help from Mrs. Hornby, and on the fifteenth of March I called at Mr. Hornby’s private house and saw her. I explained to her what was wanted to clear her nephews from the suspicion that rested on them, and she then said that she could dispose of those suspicions at once, for she could show me the thumb-prints of the whole family: she had them all in a ‘Thumbograph.’”

“A ‘Thumbograph’?” repeated the judge. “What is a ‘Thumbograph’?”

Anstey rose with the little red-covered volume in his hand.

“A ‘Thumbograph,’ my lord,” said he, “is a book, like this, in which foolish people collect the thumb-prints of their more foolish acquaintances.”

He passed the volume up to the judge, who turned over the leaves curiously and then nodded to the witness.

“Yes. She said she had them all in a ‘Thumbograph.’”

“Then she fetched from a drawer a small red-covered book which she showed to me. It contained the thumb-prints of all the family and some of her friends.”

“Is this the book?” asked the judge, passing the volume down to the witness.

The sergeant turned over the leaves until he came to one which he apparently recognised, and said—

“Yes, m’lord; this is the book. Mrs. Hornby showed me the thumb-prints of various members of the family, and then found those of the two nephews. I compared them with the photograph that I had with me and discovered that the print of the left thumb of Reuben Hornby was in every respect identical with the thumb-print shown in the photograph.”

“What did you do then?”

“I asked Mrs. Hornby to lend me the ‘Thumbograph’ so that I might show it to the Chief of the Finger-print Department, to which she consented. I had not intended to tell her of my discovery, but, as I was leaving, Mr. Hornby arrived home, and when he heard of what had taken place, he asked me why I wanted the book, and then I told him. He was greatly astonished and horrified, and wished me to return the book at once. He proposed to let the whole matter drop and take the loss of the diamonds on himself; but I pointed out that this was impossible as it would practically amount to compounding a felony. Seeing that Mrs. Hornby was so distressed at the idea of her book being used in evidence against her nephew, I promised her that I would return it to her if I could obtain a thumb-print in any other way.

“I then took the ‘Thumbograph’ to Scotland Yard and showed it to Mr. Singleton, who agreed that the print of the left thumb of Reuben Hornby was in every respect identical with the thumb-print on the paper found in the safe. On this I applied for a warrant for the arrest of Reuben Hornby, which I executed on the following morning. I told the prisoner what I had promised Mrs. Hornby, and he then offered to allow me to take a print of his left thumb so that his aunt’s book should not have to be used in evidence.”

“How is it, then,” asked the judge, “that it has been put in evidence?”

“It has been put in by the defence, my lord,” said Sir Hector Trumpler.

“I see,” said the judge. “A hair of the dog that bit him. The ‘Thumbograph’ is to be applied as a remedy on the principle that similia similibus curantur. Well?”

“When I arrested him, I administered the usual caution, and the prisoner then said, ’I am innocent. I know nothing about the robbery.’”
The counsel for the prosecution sat down, and Anstey rose to cross-examine.

"You have told us," said he, in his clear musical voice, "that you found at the bottom of the safe two rather large drops of a dark fluid which you considered to be blood. Now, what led you to believe that fluid to be blood?"

"I took some of the fluid up on a piece of white paper, and it had the appearance and colour of blood."

"Was it examined microscopically or otherwise?"

"Not to my knowledge."

"Was it quite liquid?"

"Yes, I should say quite liquid."

"What appearance had it on paper?"

"It looked like a clear red liquid of the colour of blood, and was rather thick and sticky."

Anstey sat down, and the next witness, an elderly man, answering to the name of Francis Simmons, was called.

"You are the housekeeper at Mr. Hornby’s premises in St. Mary Axe?" asked Sir Hector Trumpler.

"I am.

"Did you notice anything unusual on the night of the ninth of March?"

"I did not."

"Did you make your usual rounds on that occasion?"

"Yes. I went all over the premises several times during the night, and the rest of the time I was in a room over the private office."

"Who arrived first on the morning of the tenth?"

"Mr. Reuben. He arrived about twenty minutes before anybody else."

"What part of the building did he go to?"

"He went into the private office, which I opened for him. He remained there until a few minutes before Mr. Hornby arrived, when he went up to the laboratory."

"Who came next?"

"Mr. Hornby, and Mr. Walter came in just after him."

The counsel sat down, and Anstey proceeded to cross-examine the witness.

"Who was the last to leave the premises on the evening of the ninth?"

"I am not sure."

"Why are you not sure?"

"I had to take a note and a parcel to a firm in Shoreditch. When I started, a clerk named Thomas Holker was in the outer office and Mr. Walter Hornby was in the private office. When I returned they had both gone."

"Was the outer door locked?"

"Yes."

"Had Holker a key of the outer door?"

"No. Mr. Hornby and his two nephews had each a key, and I have one. No one else had a key."

"How long were you absent?"

"About three-quarters of an hour."

"Who gave you the note and the parcel?"

"Mr. Walter Hornby."

"When did he give them to you?"

"He gave them to me just before I started, and told me to go at once for fear the place should be closed before I got there."

"And was the place closed?"

"Yes. It was all shut up, and everybody had gone."

Anstey resumed his seat, the witness shuffled out of the box with an air of evident relief, and the usher called out, "Henry James Singleton."

Mr. Singleton rose from his seat at the table by the solicitors for the prosecution and entered the box. Sir Hector adjusted
his glasses, turned over a page of his brief, and cast a steady and impressive glance at the jury.

“I believe, Mr. Singleton,” he said at length, “that you are connected with the Finger-print Department at Scotland Yard?”

“Yes, I am one of the chief assistants in that department.”

“What are your official duties?”

“My principal occupation consists in the examination and comparison of the finger-prints of criminals and suspected persons. These finger-prints are classified by me according to their characters and arranged in files for reference.”

“I take it that you have examined a great number of finger-prints?”

“I have examined many thousands of finger-prints, and have studied them closely for purposes of identification.”

“Kindly examine this paper, Mr. Singleton” (here the fatal leaflet was handed to him by the usher); “have you ever seen it before?”

“Yes. It was handed to me for examination at my office on the tenth of March.”

“There is a mark upon it—the print of a finger or thumb. Can you tell us anything about that mark?”

“It is the print of the left thumb of Reuben Hornby, the prisoner at the bar.”

“You are quite sure of that?”

“I am quite sure.”

“Do you swear that the mark upon that paper was made by the thumb of the prisoner?”

“I do.”

“Could it not have been made by the thumb of some other person?”

“No; it is impossible that it could have been made by any other person.”

At this moment I felt Juliet lay a trembling hand on mine, and, glancing at her, I saw that she was deathly pale. I took her hand in mine and, pressing it gently, whispered to her, “Have courage; there is nothing unexpected in this.”

“Thank you,” she whispered in reply, with a faint smile; “I will try; but it is all so horribly unnerving.”

“You consider,” Sir Hector proceeded, “that the identity of this thumb-print admits of no doubt?”

“It admits of no doubt whatever,” replied Mr. Singleton.

“Can you explain to us, without being too technical, how you have arrived at such complete certainty?”

“I myself took a print of the prisoner’s thumb—having first obtained the prisoner’s consent after warning him that the print would be used in evidence against him—and I compared that print with the mark on this paper. The comparison was made with the greatest care and by the most approved method, point by point and detail by detail, and the two prints were found to be identical in every respect.

“Now it has been proved by exact calculations—which calculations I have personally verified—that the chance that the print of a single finger of any given person will be exactly like the print of the same finger of any other given person is as one to sixty-four thousand millions. That is to say that, since the number of the entire human race is about sixteen thousand millions, the chance is about one to four that the print of a single finger of any one person will be identical with that of the same finger of any other member of the human race.

“It has been said by a great authority—and I entirely agree with the statement—that a complete, or nearly complete, accordance between two prints of a single finger affords evidence requiring no corroboration that the persons from whom they were made are the same.

“Now, these calculations apply to the prints of ordinary and normal fingers or thumbs. But the thumb from which these prints were taken is not ordinary or normal. There is upon it a deep but clean linear scar—the scar of an old incised wound—and this scar passes across the pattern of the ridges, intersecting the latter at certain places and disturbing their continuity at others. Now this very characteristic scar is an additional feature, having a set of chances of its own. So that we have to consider not only the chance that the print of the prisoner’s left thumb should be identical with the print of some other person’s left thumb—which is as one to sixty-four thousand millions—but the further chance that these two identical thumb-prints should be traversed by the impression of a scar identical in size and appearance, and intersecting the ridges at exactly the same places and producing failures of continuity in the ridges of exactly the same character. But these two chances, multiplied into one another, yield an ultimate chance of about one to four thousand trillions that the prisoner’s left thumb will exactly resemble the print of some other person’s thumb, both as to the pattern and the scar which crosses the pattern; in other words such a coincidence is an utter impossibility.”

Sir Hector Trumpler took off his glasses and looked long and steadily at the jury as though he should say, “Come, my friends; what do you think of that?” Then he sat down with a jerk and turned towards Anstey and Thorndyke with a look of triumph.

“Do you propose to cross-examine the witness?” inquired the judge, seeing that the counsel for the defence made no
sign.

“No, my lord,” replied Anstey.

Thereupon Sir Hector Trumpler turned once more towards the defending counsel, and his broad, red face was illumined by a smile of deep satisfaction. That smile was reflected on the face of Mr. Singleton as he stepped from the box, and, as I glanced at Thorndyke, I seemed to detect, for a single instant, on his calm and immovable countenance, the faintest shadow of a smile.

“Herbert John Nash!”

A plump, middle-aged man, of keen, though studious, aspect, stepped into the box, and Sir Hector rose once more.

“You are one of the chief assistants in the Finger-print Department, I believe, Mr. Nash?”

“I am.”

“Have you heard the evidence of the last witness?”

“I have.”

“Do you agree with the statements made by that witness?”

“ Entirely. I am prepared to swear that the print on the paper found in the safe is that of the left thumb of the prisoner, Reuben Hornby.”

“And you are certain that no mistake is possible?”

“I am certain that no mistake is possible.”

Again Sir Hector glanced significantly at the jury as he resumed his seat, and again Anstey made no sign beyond the entry of a few notes on the margin of his brief.

“Are you calling any more witnesses?” asked the judge, dipping his pen in the ink.

“No, my lord,” replied Sir Hector. “That is our case.”

Upon this Anstey rose and, addressing the judge, said—

“I call witnesses, my lord.”

The judge nodded and made an entry in his notes while Anstey delivered his brief introductory speech—

“My lord and gentlemen of the jury, I shall not occupy the time of the Court with unnecessary appeals at this stage, but shall proceed to take the evidence of my witnesses without delay.”

There was a pause of a minute or more, during which the silence was broken only by the rustle of papers and the squeaking of the judge’s quill pen. Juliet turned a white, scared face to me and said in a hushed whisper—

“This is terrible. That last man’s evidence is perfectly crushing. What can possibly be said in reply? I am in despair; oh! poor Reuben! He is lost, Dr. Jervis! He hasn’t a chance now.”

“Do you believe that he is guilty?” I asked.

“Certainly not!” she replied indignantly. “I am as certain of his innocence as ever.”

“Then,” said I, “if he is innocent, there must be some means of proving his innocence.”

“Yes. I suppose so,” she rejoined in a dejected whisper. “At any rate we shall soon know now.”

At this moment the usher’s voice was heard calling out the name of the first witness for the defence.

“Edmund Horford Rowe!”

A keen-looking, grey-haired man, with a shaven face and close-cut side-whiskers, stepped into the box and was sworn in due form.

“You are a doctor of medicine, I believe,” said Anstey, addressing the witness, “and lecturer on Medical Jurisprudence at the South London Hospital?”

“I am.”

“Have you had occasion to study the properties of blood?”

“Yes. The properties of blood are of great importance from a medico-legal point of view.”

“Can you tell us what happens when a drop of blood—say from a cut finger—falls upon a surface such as the bottom of an iron safe?”

“A drop of blood from a living body falling upon any non-absorbent surface will, in the course of a few minutes, solidify into a jelly which will, at first, have the same bulk and colour as the liquid blood.”

“Will it undergo any further change?”

“Yes. In a few minutes more the jelly will begin to shrink and become more solid so that the blood will become separated
into two parts, the solid and the liquid. The solid part will consist of a firm, tough jelly of a deep red colour, and the liquid part will consist of a pale yellow, clear, watery liquid.

"At the end, say, of two hours, what will be the condition of the drop of blood?"

"It will consist of a drop of clear, nearly colourless liquid, in the middle of which will be a small, tough, red clot."

"Supposing such a drop to be taken up on a piece of white paper, what would be its appearance?"

"The paper would be wetted by the colourless liquid, and the solid clot would probably adhere to the paper in a mass."

"Would the blood on the paper appear as a clear, red liquid?"

"Certainly not. The liquid would appear like water, and the clot would appear as a solid mass sticking to the paper."

"Does blood always behave in the way you have described?"

"Always, unless some artificial means are taken to prevent it from clotting."

"By what means can blood be prevented from clotting or solidifying?"

"There are two principal methods. One is to stir or whip the fresh blood rapidly with a bundle of fine twigs. When this is done, the fibrin—the part of the blood that causes solidification—adheres to the twigs, and the blood that remains, though it is unchanged in appearance, will remain liquid for an indefinite time. The other method is to dissolve a certain proportion of some alkaline salt in the fresh blood, after which it no longer has any tendency to solidify."

"You have heard the evidence of Inspector Sanderson and Sergeant Bates?"

"Yes."

"Inspector Sanderson has told us that he examined the safe at 10.31 a.m. and found two good-sized drops of blood on the bottom. Sergeant Bates has told us that he examined the safe two hours later, and that he took up one of the drops of blood on a piece of white paper. The blood was then quite liquid, and, on the paper, it looked like a clear, red liquid of the colour of blood. What should you consider the condition and nature of that blood to have been?"

"If it was really blood at all, I should say that it was either defibrinated blood—that is, blood from which the fibrin has been extracted by whipping—or that it had been treated with an alkaline salt."

"You are of opinion that the blood found in the safe could not have been ordinary blood shed from a cut or wound?"

"I am sure it could not have been."

"Now, Dr. Rowe, I am going to ask you a few questions on another subject. Have you given any attention to finger-prints made by bloody fingers?"

"Yes. I have recently made some experiments on the subject."

"Will you give us the results of those experiments?"

"My object was to ascertain whether fingers wet with fresh blood would yield distinct and characteristic prints. I made a great number of trials, and as a result found that it is extremely difficult to obtain a clear print when the finger is wetted with fresh blood. The usual result is a mere red blot showing no ridge pattern at all, owing to the blood filling the furrows between the ridges. But if the blood is allowed to dry almost completely on the finger, a very clear print is obtained."

"Is it possible to recognise a print that has been made by a nearly dry finger?"

"Yes; quite easily. The half-dried blood is nearly solid and adheres to the paper in a different way from the liquid, and it shows minute details, such as the mouths of the sweat glands, which are always obliterated by the liquid.

"Look carefully at this paper, which was found in the safe, and tell me what you see."

The witness took the paper and examined it attentively, first with the naked eye and then with a pocket-lens.

"I see," said he, "two blood-marks and a print, apparently of a thumb. Of the two marks, one is a blot, smeared slightly by a finger or thumb; the other is a smear only. Both were evidently produced with quite liquid blood. The thumb-print was also made with liquid blood."

"You are quite sure that the thumb-print was made with liquid blood?"

"Quite sure."

"Is there anything unusual about the thumb-print?"

"Yes. It is extraordinarily clear and distinct. I have made a great number of trials and have endeavoured to obtain the clearest prints possible with fresh blood; but none of my prints are nearly as distinct as this one."

Here the witness produced a number of sheets of paper, each of which was covered with the prints of bloody fingers, and compared them with the memorandum slip.

The papers were handed to the judge for his inspection, and Anstey sat down, when Sir Hector Trumpler rose, with a somewhat puzzled expression on his face, to cross-examine.
“You say that the blood found in the safe was defibrinated or artificially treated. What inference do you draw from that fact?”

“I infer that it was not dropped from a bleeding wound.”

“Can you form any idea how such blood should have got into the safe?”

“None whatever.”

“You say that the thumb-print is a remarkably distinct one. What conclusion do you draw from that?”

“I do not draw any conclusion. I cannot account for its distinctness at all.”

The learned counsel sat down with rather a baffled air, and I observed a faint smile spread over the countenance of my colleague.

“Arabella Hornby.”

A muffled whimpering from my neighbour on the left hand was accompanied by a wild rustling of silk. Glancing at Mrs. Hornby, I saw her stagger from the bench, shaking like a jelly, mopping her eyes with her handkerchief and grasping her open purse. She entered the witness-box, and, having gazed wildly round the court, began to search the multitudinous compartments of her purse.

“The evidence you shall give,” sang out the usher—whereat Mrs. Hornby paused in her search and stared at him apprehensively—“to the court and jury sworn, between our Sovereign Lord the King and the prisoner at the bar shall be the truth,—”

“Certainly,” said Mrs. Hornby stiffly, “I—”

“—the whole truth, and nothing but the truth; so help you God!”

He held out the Testament, which she took from him with a trembling hand and forthwith dropped with a resounding bang on to the floor of the witness-box, diving after it with such precipitancy that her bonnet jammed violently against the rail of the box.

She disappeared from view for a moment, and then rose from the depths with a purple face and her bonnet flattened and cocked over one ear like an artillery-man’s forage cap.

“Kiss the Book, if you please,” said the usher, suppressing a grin by an heroic effort, as Mrs. Hornby, encumbered by her purse, her handkerchief and the Testament, struggled to unfasten her bonnet-strings. She clawed frantically at her bonnet, and, having dusted the Testament with her handkerchief, kissed it tenderly and laid it on the rail of the box, whence it fell instantly on to the floor of the court.

“I am really very sorry!” exclaimed Mrs. Hornby, leaning over the rail to address the usher as he stooped to pick up the Book, and discharging on to his back a stream of coins, buttons and folded bills from her open purse; “you will think me very awkward, I’m afraid.”

She mopped her face and replaced her bonnet rakishly on one side, as Anstey rose and passed a small red book across to her.

“Kindly look at that book, Mrs. Hornby.”

“I'd rather not,” said she, with a gesture of repugnance. “It is associated with matters of so extremely disagreeable a character—”

“Do you recognise it?”

“Do I recognise it! How can you ask me such a question when you must know—”

“Answer the question,” interposed the judge. “Do you or do you not recognise the book in your hand?”

“Of course I recognise it. How could I fail to—”

“Then say so,” said the judge.

“I have said so,” retorted Mrs. Hornby indignantly.

The judge nodded to Anstey, who then continued—“It is called a ‘Thumbograph,’ I believe.”

“Yes: the name ‘Thumbograph’ is printed on the cover, so I suppose that is what it is called.”

“Will you tell us, Mrs. Hornby, how the ‘Thumbograph’ came into your possession?”

For one moment Mrs. Hornby stared wildly at her interrogator; then she snatched a paper from her purse, unfolded it, gazed at it with an expression of dismay, and crumpled it up in the palm of her hand.

“You are asked a question,” said the judge.

“Oh! yes,” said Mrs. Hornby. “The Committee of the Society—no, that is the wrong one—I mean Walter, you know—at least—”

“I beg your pardon,” said Anstey, with polite gravity.
“You were speaking of the committee of some society,” interposed the judge. “What society were you referring to?” Mrs. Hornby spread out the paper and, after a glance at it, replied—

“The Society of Paralysed Idiots, your worship,” whereat a rumble of suppressed laughter arose from the gallery.

“But what has that society to do with the ‘Thumbograph’?” inquired the judge.

“Nothing, your worship. Nothing at all.”

“Then why did you refer to it?”

“I am sure I don’t know,” said Mrs. Hornby, wiping her eyes with the paper and then hastily exchanging it for her handkerchief.

The judge took off his glasses and gazed at Mrs. Hornby with an expression of bewilderment. Then he turned to the counsel and said in a weary voice—“Proceed, if you please, Mr. Anstey.”

“Can you tell us, Mrs. Hornby, how the ‘Thumbograph’ came into your possession?” said the latter in persuasive accents.

“I thought it was Walter, and so did my niece, but Walter says it was not, and he ought to know, being young and having a most excellent memory, as I had myself when I was his age, and really, you know, it can’t possibly matter where I got the thing—”

“But it does matter,” interrupted Anstey. “We wish particularly to know.”

“If you mean that you wish to get one like it—”

“We do not,” said Anstey. “We wish to know how that particular ‘Thumbograph’ came into your possession. Did you, for instance, buy it yourself, or was it given to you by someone?”

“Walter says I bought it myself, but I thought he gave it to me, but he says he did not, and you see—”

“Never mind what Walter says. What is your own impression?”

“Why I still think that he gave it to me, though, of course, seeing that my memory is not what it was—”

“You think that Walter gave it to you?”

“Yes, in fact I feel sure he did, and so does my niece.”

“Walter is your nephew, Walter Hornby?”

“Yes, of course. I thought you knew.”

“Can you recall the occasion on which the ‘Thumbograph’ was given to you?”

“Oh yes, quite distinctly. We had some people to dinner—some people named Colley—not the Dorsetshire Colleys, you know, although they are exceedingly nice people, as I have no doubt the other Colleys are, too, when you know them, but we don’t. Well, after dinner we were a little dull and rather at a loss, because Juliet, my niece, you know, had cut her finger and couldn’t play the piano excepting with the left hand, and that is so monotonous as well as fatiguing, and the Colleys are not musical, excepting Adolphus, who plays the trombone, but he hadn’t got it with him, and then, fortunately, Walter came in and brought the ‘Thumbograph’ and took all our thumb-prints and his own as well, and we were very much amused, and Matilda Colley—that is the eldest daughter but one—said that Reuben jogged her elbow, but that was only an excuse—”

“Exactly,” interrupted Anstey. “And you recollect quite clearly that your nephew Walter gave you the ‘Thumbograph’ on that occasion?”

“Oh, distinctly; though, you know, he is really my husband’s nephew—”

“Yes. And you are sure that he took the thumb-prints?”

“Quite sure.”

“And you are sure that you never saw the ‘Thumbograph’ before that?”

“Never. How could I? He hadn’t brought it.”

“Have you ever lent the ‘Thumbograph’ to anyone?”

“No, never. No one has ever wanted to borrow it, because, you see—”

“Has it never, at any time, gone out of your possession?”

“Oh, I wouldn’t say that; in fact, I have often thought, though I hate suspecting people, and I really don’t suspect anybody in particular, you know, but it certainly was very peculiar and I can’t explain it in any other way. You see, I kept the ‘Thumbograph’ in a drawer in my writing table, and in the same drawer I used to keep my handkerchief-bag—in fact I do still, and it is there at this very moment, for in my hurry and agitation, I forgot about it until we were in the cab, and then it was too late, because Mr. Lawley—”

“Yes. You kept it in a drawer with your handkerchief-bag.”
“That was what I said. Well, when Mr. Hornby was staying at Brighton he wrote to ask me to go down for a week and bring Juliet—Miss Gibson, you know—with me. So we went, and, just as we were starting, I sent Juliet to fetch my handkerchief-bag from the drawer, and I said to her, ‘Perhaps we might take the thumb-book with us; it might come in useful on a wet day.’ So she went, and presently she came back and said that the ‘Thumbograph’ was not in the drawer. Well, I was so surprised that I went back with her and looked myself, and sure enough the drawer was empty. Well, I didn’t think much of it at the time, but when we came home again, as soon as we got out of the cab, I gave Juliet my handkerchief-bag to put away, and presently she came running to me in a great state of excitement. ‘Why, Auntie,’ she said, ‘the “Thumbograph” is in the drawer; somebody must have been meddling with your writing table.’ I went with her to the drawer, and there, sure enough, was the ‘Thumbograph.’ Somebody must have taken it out and put it back while we were away.”

“Who could have had access to your writing table?”

“Oh, anybody, because, you see, the drawers were never locked. We thought it must have been one of the servants.”

“Had anyone been to the house during your absence?”

“No. Nobody, except, of course, my two nephews; and neither of them had touched it, because we asked them, and they both said they had not.”

“Thank you.” Anstey sat down, and Mrs. Hornby having given another correcting twist to her bonnet, was about to step down from the box when Sir Hector rose and bestowed upon her an intimidating stare.

“You made some reference,” said he, “to a society—the Society of Paralysed Idiots, I think, whatever that may be. Now what caused you to make that reference?”

“It was a mistake; I was thinking of something else.”

“I know it was a mistake. You referred to a paper that was in your hand.”

“I did not refer to it, I merely looked at it. It is a letter from the Society of Paralysed Idiots. It is nothing to do with me really, you know; I don’t belong to the society, or anything of that sort.”

“Did you mistake that paper for some other paper?”

“Yes, I took it for a paper with some notes on it to assist my memory.”

“What kind of notes?”

“Oh, just the questions I was likely to be asked.”

“Were the answers that you were to give to those questions also written on the paper?”

“Of course they were. The questions would not have been any use without the answers.”

“Have you been asked the questions that were written on the paper?”

“Yes; at least, some of them.”

“Have you given the answers that were written down?”

“I don’t think I have—in fact, I am sure I haven’t, because, you see—”

“Ah! you don’t think you have.” Sir Hector Trumpler smiled significantly at the jury, and continued—

“Now who wrote down those questions and answers?”

“My nephew, Walter Hornby. He thought, you know—”

“Never mind what he thought. Who advised or instructed him to write them down?”

“Nobody. It was entirely his own idea, and very thoughtful of him, too, though Dr. Jervis took the paper away from me and said I must rely on my memory.”

Sir Hector was evidently rather taken aback by this answer, and sat down suddenly, with a distinctly chapfallen air.

“Where is this paper on which the questions and answers are written?” asked the judge. In anticipation of this inquiry I had already handed it to Thorndyke, and had noted by the significant glance that he bestowed on me that he had not failed to observe the peculiarity in the type. Indeed the matter was presently put beyond all doubt, for he hastily passed to me a scrap of paper, on which I found, when I opened it out, that he had written “X = W.H.”

As Anstey handed the rather questionable document up to the judge, I glanced at Walter Hornby and observed him to flush angrily, though he strove to appear calm and unconcerned, and the look that he directed at his aunt was very much the reverse of benevolent.

“Is this the paper?” asked the judge, passing it down to the witness.

“Yes, your worship,” answered Mrs. Hornby, in a tremulous voice; whereupon the document was returned to the judge, who proceeded to compare it with his notes.

“I shall order this document to be impounded,” said he sternly, after making a brief comparison. “There has been a
distinct attempt to tamper with witnesses. Proceed with your case, Mr. Anstey."

There was a brief pause, during which Mrs. Hornby tottered across the court and resumed her seat, gasping with excitement and relief; then the usher called out—

“John Evelyn Thorndyke!”

“Thank God!” exclaimed Juliet, clasping her hands. “Oh! will he be able to save Reuben? Do you think he will, Dr. Jervis?”

“There is someone who thinks he will,” I replied, glancing towards Polton, who, clasping in his arms the mysterious box and holding on to the microscope case, gazed at his master with a smile of ecstasy. “Polton has more faith than you have, Miss Gibson.”

“Yes, the dear, faithful little man!” she rejoined. “Well, we shall know the worst very soon now, at any rate.”

“The worst or the best,” I said. “We are now going to hear what the defence really is.”

“God grant that it may be a good defence,” she exclaimed in a low voice; and I—though not ordinarily a religious man—murmured “Amen!”

---

XVI. — THORNDYKE PLAYS HIS CARD

AS Thorndyke took his place in the box I looked at him with a sense of unreasonable surprise, feeling that I had never before fully realised what manner of man my friend was as to his externals. I had often noted the quiet strength of his face, its infinite intelligence, its attractiveness and magnetism; but I had never before appreciated what now impressed me most: that Thorndyke was actually the handsomest man I had ever seen. He was dressed simply, his appearance unaided by the flowing gown or awe-inspiring wig, and yet his presence dominated the court. Even the judge, despite his scarlet robe and trappings of office, looked commonplace by comparison, while the jurymen, who turned to look at him, seemed like beings of an inferior order. It was not alone the distinction of the tall figure, erect and dignified, nor the power and massive composure of his face, but the actual symmetry and comeliness of the face itself that now arrested my attention; a comeliness that made it akin rather to some classic mask, wrought in the ivory-toned marble of Pentelicus, than to the eager faces that move around us in the hurry and bustle of a life at once strenuous and trivial.

“You are attached to the medical school at St. Margaret’s Hospital, I believe, Dr. Thorndyke?” said Anstey.

“Yes. I am the lecturer on Medical Jurisprudence and Toxicology.”

“Have you had much experience of medico-legal inquiries?”

“A great deal. I am engaged exclusively in medico-legal work.”

“You heard the evidence relating to the two drops of blood found in the safe?”

“I did.”

“What is your opinion as to the condition of that blood?”

“I should say there is no doubt that it had been artificially treated—probably by defibrination.”

“Can you suggest any explanation of the condition of that blood?”

“I can.”

“Is your explanation connected with any peculiarities in the thumb-print on the paper that was found in the safe?”

“It is.”

“Have you given any attention to the subject of finger-prints?”

“Yes. A great deal of attention.”

“Be good enough to examine that paper” (here the usher handed to Thorndyke the memorandum slip). “Have you seen it before?”

“Yes. I saw it at Scotland Yard.”

“Did you examine it thoroughly?”

“Very thoroughly. The police officials gave me every facility and, with their permission, I took several photographs of it.”

“There is a mark on that paper resembling the print of a human thumb?”

“There is.”

“You have heard two expert witnesses swear that that mark was made by the left thumb of the prisoner, Reuben Hornby?”

“I have.”

“Do you agree to that statement?”
"I do not."
"In your opinion, was the mark upon that paper made by the thumb of the prisoner?"
"No. I am convinced that it was not made by the thumb of Reuben Hornby."
"Do you think that it was made by the thumb of some other person?"
"No. I am of opinion that it was not made by a human thumb at all."

At this statement the judge paused for a moment, pen in hand, and stared at Thorndyke with his mouth slightly open, while the two experts looked at one another with raised eyebrows.

"By what means do you consider that the mark was produced?"
"By means of a stamp, either of indiarubber or, more probably, of chromicized gelatine."

Here Polton, who had been, by degrees, rising to an erect posture, smote his thigh a resounding thwack and chuckled aloud, a proceeding that caused all eyes, including those of the judge, to be turned on him.

"If that noise is repeated," said the judge, with a stony stare at the horrified offender—who had shrunk into the very smallest space that I have ever seen a human being occupy—"I shall cause the person who made it to be removed from the court."

"I understand, then," pursued Anstey, "that you consider the thumb-print, which has been sworn to as the prisoner's, to be a forgery?"
"Yes. It is a forgery."
"But is it possible to forge a thumb-print or a finger-print?"
"It is not only possible, but quite easy to do."
"As easy as to forge a signature, for instance?"
"Much more so, and infinitely more secure. A signature, being written with a pen, requires that the forgery should also be written with a pen, a process demanding very special skill and, after all, never resulting in an absolute facsimile. But a finger-print is a stamped impression—the finger-tip being the stamp; and it is only necessary to obtain a stamp identical in character with the finger-tip, in order to produce an impression which is an absolute facsimile, in every respect, of the original, and totally indistinguishable from it."

"Would there be no means at all of detecting the difference between a forged finger-print and the genuine original?"
"None whatever; for the reason that there would be no difference to detect."
"But you have stated, quite positively, that the thumb-print on this paper is a forgery. Now, if the forged print is indistinguishable from the original, how are you able to be certain that this particular print is a forgery?"
"I was speaking of what is possible with due care, but, obviously, a forger might, through inadvertence, fail to produce an absolute facsimile and then detection would be possible. That is what has happened in the present case. The forged print is not an absolute facsimile of the true print. There is a slight discrepancy. But, in addition to this, the paper bears intrinsic evidence that the thumb-print on it is a forgery."

"We will consider that evidence presently, Dr. Thorndyke. To return to the possibility of forging a finger-print, can you explain to us, without being too technical, by what methods it would be possible to produce such a stamp as you have referred to?"

"There are two principal methods that suggest themselves to me. The first, which is rather crude though easy to carry out, consists in taking an actual cast of the end of the finger. A mould would be made by pressing the finger into some plastic material, such as fine modelling clay or hot sealing wax, and then, by pouring a warm solution of gelatine into the mould, and allowing it to cool and solidify, a cast would be produced which would yield very perfect finger-prints. But this method would, as a rule, be useless for the purpose of the forger, as it could not, ordinarily, be carried out without the knowledge of the victim; though in the case of dead bodies and persons asleep or unconscious or under an anaesthetic, it could be practised with success, and would offer the advantage of requiring practically no technical skill or knowledge and no special appliances. The second method, which is much more efficient, and is the one, I have no doubt, that has been used in the present instance, requires more knowledge and skill.

"In the first place it is necessary to obtain possession of, or access to, a genuine finger-print. Of this finger-print a photograph is taken, or rather, a photographic negative, which for this purpose requires to be taken on a reversed plate, and the negative is put into a special printing frame, with a plate of gelatine which has been treated with potassium bichromate, and the frame is exposed to light.

"Now gelatine treated in this way—chromicized gelatine, as it is called—has a very peculiar property. Ordinary gelatine, as is well known, is easily dissolved in hot water, and chromicized gelatine is also soluble in hot water as long as it is not exposed to light; but on being exposed to light, it undergoes a change and is no longer capable of being dissolved in hot water. Now the plate of chromicized gelatine under the negative is protected from the light by the opaque parts of the negative, whereas the light passes freely through the transparent parts; but the transparent parts of the negative
correspond to the black marks on the finger-print, and these correspond to the ridges on the finger. Hence it follows that the gelatine plate is acted upon by light only on the parts corresponding to the ridges; and in these parts the gelatine is rendered insoluble, while all the rest of the gelatine is soluble. The gelatine plate, which is cementsed to a thin plate of metal for support, is now carefully washed with hot water, by which the soluble part of the gelatine is dissolved away leaving the insoluble part (corresponding to the ridges) standing up from the surface. Thus there is produced a facsimile in relief of the finger-print having actual ridges and furrows identical in character with the ridges and furrows of the finger-tip. If an inked roller is passed over this relief, or if the relief is pressed lightly on an inked slab, and then pressed on a sheet of paper, a finger-print will be produced which will be absolutely identical with the original, even to the little white spots which mark the orifices of the sweat glands. It will be impossible to discover any difference between the real finger-print and the counterfeit because, in fact, no difference exists."

"But surely the process you have described is a very difficult and intricate one?"

"Not at all; it is very little more difficult than ordinary carbon printing, which is practised successfully by numbers of amateurs. Moreover, such a relief as I have described—which is practically nothing more than an ordinary process block—could be produced by any photo-engraver. The process that I have described is, in all essentials, that which is used in the reproduction of pen-and-ink drawings, and any of the hundreds of workmen who are employed in that industry could make a relief-block of a finger-print, with which an undetectable forgery could be executed."

"You have asserted that the counterfeit finger-print could not be distinguished from the original. Are you prepared to furnish proof that this is the case?"

"Yes. I am prepared to execute a counterfeit of the prisoner's thumb-print in the presence of the Court."

"And do you say that such a counterfeit would be indistinguishable from the original, even by the experts?"

"I do."

Anstey turned towards the judge. "Would your lordship give your permission for a demonstration such as the witness proposes?"

"Certainly," replied the judge. "The evidence is highly material. How do you propose that the comparison should be made?" he added, addressing Thorndyke.

"I have brought, for the purpose, my lord," answered Thorndyke, "some sheets of paper, each of which is ruled into twenty numbered squares. I propose to make on ten of the squares counterfeits of the prisoner's thumb-mark, and to fill the remaining ten with real thumb-marks. I propose that the experts should then examine the paper and tell the Court which are the real thumb-prints and which are the false."

"That seems a fair and efficient test," said his lordship. "Have you any objection to offer, Sir Hector?"

Sir Hector Trumpler hastily consulted with the two experts, who were sitting in the attorney's bench, and then replied, without much enthusiasm—

"We have no objection to offer, my lord."

"Then, in that case, I shall direct the expert witnesses to withdraw from the court while the prints are being made."

In obedience to the judge's order, Mr. Singleton and his colleague rose and left the court with evident reluctance, while Thorndyke took from a small portfolio three sheets of paper which he handed up to the judge.

"If your lordship," said he, "will make marks in ten of the squares on two of these sheets, one can be given to the jury and one retained by your lordship to check the third sheet when the prints are made on it."

"That is an excellent plan," said the judge; "and, as the information is for myself and the jury, it would be better if you came up and performed the actual stamping on my table in the presence of the foreman of the jury and the counsel for the prosecution and defence."

In accordance with the judge's direction Thorndyke stepped up on the dais, and Anstey, as he rose to follow, leaned over towards me.

"You and Polton had better go up too," said he: "Thorndyke will want your assistance, and you may as well see the fun. I will explain to his lordship."

He ascended the stairs leading to the dais and addressed a few words to the judge, who glanced in our direction and nodded, whereupon we both gleefully followed our counsel, Polton carrying the box and beaming with delight.

The judge's table was provided with a shallow drawer which pulled out at the side and which accommodated the box comfortably, leaving the small table-top free for the papers. When the lid of the box was raised, there were displayed a copper inking-slab, a small roller and the twenty-four "pawns" which had so puzzled Polton, and on which he now gazed with a twinkle of amusement and triumph.

"Are those all stamps?" inquired the judge, glancing curiously at the array of turned-wood handles.

"They are all stamps, my lord," replied Thorndyke, "and each is taken from a different impression of the prisoner's thumb."
“But why so many?” asked the judge.

“I have multiplied them,” answered Thorndyke, as he squeezed out a drop of finger-print ink on to the slab and proceeded to roll it out into a thin film, “to avoid the tell-tale uniformity of a single stamp. And I may say,” he added, “that it is highly important that the experts should not be informed that more than one stamp has been used.”

“Yes, I see that,” said the judge. “You understand that, Sir Hector,” he added, addressing the counsel, who bowed stiffly, clearly regarding the entire proceeding with extreme disfavour.

Thorndyke now inked one of the stamps and handed it to the judge, who examined it curiously and then pressed it on a piece of waste paper, on which there immediately appeared a very distinct impression of a human thumb.

“Marvellous!” he exclaimed. “Most ingenious! Too ingenious!” He chuckled softly and added, as he handed the stamp and the paper to the foreman of the jury: “It is well, Dr. Thorndyke, that you are on the side of law and order, for I am afraid that, if you were on the other side, you would be one too many for the police. Now, if you are ready, we will proceed. Will you, please, stamp an impression in square number three.”

Thorndyke drew a stamp from its compartment, inked it on the slab, and pressed it neatly on the square indicated, leaving there a sharp, clear thumb-print.

The process was repeated on nine other squares, a different stamp being used for each impression. The judge then marked the ten corresponding squares of the other two sheets of paper, and having checked them, directed the foreman to exhibit the sheet bearing the false thumb-prints to the jury, together with the marked sheet which they were to retain, to enable them to check the statements of the expert witnesses. When this was done, the prisoner was brought from the dock and stood beside the table. The judge looked with a curious and not unkindly interest at the handsome, manly fellow who stood charged with a crime so sordid and out of character with his appearance, and I felt, as I noted the look, that Reuben would, at least, be tried fairly on the evidence, without prejudice or even with some prepossession in his favour.

With the remaining part of the operation Thorndyke proceeded carefully and deliberately. The inking-slab was rolled afresh for each impression, and, after each, the thumb was cleansed with petrol and thoroughly dried; and when the process was completed and the prisoner led back to the dock, the twenty squares on the paper were occupied by twenty thumb-prints, which, to my eye, at any rate, were identical in character.

The judge sat for upon a minute poring over this singular document with an expression half-way between a frown and a smile. At length, when we had all returned to our places, he directed the usher to bring in the witnesses.

I was amused to observe the change that had come over the experts in the short interval. The confident smile, the triumphant air of laying down a trump card, had vanished, and the expression of both was one of anxiety, not unmixed with apprehension. As Mr. Singleton advanced hesitatingly to the table, I recalled the words that he had uttered in his room at Scotland Yard; evidently his scheme of the game that was to end in an easy checkmate, had not included the move that had just been made.

“Mr. Singleton,” said the judge, “here is a paper on which there are twenty thumb-prints. Ten of them are genuine prints of the prisoner’s left thumb and ten are forgeries. Please examine them and note down in writing which are the true prints and which are the forgeries. When you have made your notes the paper will be handed to Mr. Nash.”

“Is there any objection to my using the photograph that I have with me for comparison, my lord?” asked Mr. Singleton.

“I think not,” replied the judge. “What do you say, Mr. Anstey?”

“No objection whatever, my lord,” answered Anstey.

Mr. Singleton accordingly drew from his pocket an enlarged photograph of the thumb-print and a magnifying glass, with the aid of which he explored the bewildering array of prints on the paper before him; and as he proceeded I remarked with satisfaction that his expression became more and more dubious and worried. From time to time he made an entry on a memorandum slip beside him, and, as the entries accumulated, his frown grew deeper and his aspect more puzzled and gloomy.

At length he sat up, and taking the memorandum slip in his hand, addressed the judge.

“I have finished my examination, my lord.”

“Very well. Mr. Nash, will you kindly examine the paper and write down the results of your examination?”

“Oh! I wish they would make haste,” whispered Juliet. “Do you think they will be able to tell the real from the false thumb-prints?”

“I can’t say,” I replied; “but we shall soon know. They looked all alike to me.”

Mr. Nash made his examination with exasperating deliberateness, and preserved throughout an air of stolid attention; but at length he, too, completed his notes and handed the paper back to the usher.

“Now, Mr. Singleton,” said the judge, “let us hear your conclusions. You have been sworn.”

Mr. Singleton stepped into the witness-box, and, laying his notes on the ledge, faced the judge.

“Have you examined the paper that was handed to you?” asked Sir Hector Trumpler.
“I have.”

“What did you see on the paper?”

“I saw twenty thumb-prints, of which some were evident forgeries, some were evidently genuine, and some were doubtful.”

“Taking the thumb-prints seriatim, what have you noted about them?”

Mr. Singleton examined his notes and replied—“The thumb-print on square one is evidently a forgery, as is also number two, though it is a passable imitation. Three and four are genuine; five is an obvious forgery. Six is a genuine thumb-print; seven is a forgery, though a good one; eight is genuine; nine is, I think, a forgery, though it is a remarkably good imitation. Ten and eleven are genuine thumb-marks; twelve and thirteen are forgeries; but as to fourteen I am very doubtful, though I am inclined to regard it as a forgery. Fifteen is genuine, and I think sixteen is also; but I will not swear to it. Seventeen is certainly genuine. Eighteen and nineteen I am rather doubtful about, but I am disposed to consider them both forgeries. Twenty is certainly a genuine thumb-print.”

As Mr. Singleton’s evidence proceeded, a look of surprise began to make its appearance on the judge’s face, while the jury glanced from the witness to the notes before them and from their notes to one another in undisguised astonishment.

As to Sir Hector Trumpler, that luminary of British jurisprudence was evidently completely fogged; for, as statement followed statement, he pursed up his lips and his broad, red face became overshadowed by an expression of utter bewilderment.

For a few seconds he stared blankly at his witness and then dropped on to his seat with a thump that shook the court.

“You have no doubt,” said Anstey, “as to the correctness of your conclusions? For instance, you are quite sure that the prints one and two are forgeries?”

“I have no doubt.”

“You swear that those two prints are forgeries?”

Mr. Singleton hesitated for a moment. He had been watching the judge and the jury and had apparently misinterpreted their surprise, assuming it to be due to his own remarkable powers of discrimination; and his confidence had revived accordingly.

“Yes,” he answered; “I swear that they are forgeries.”

Anstey sat down, and Mr. Singleton, having passed his notes up to the judge, retired from the box, giving place to his colleague.

Mr. Nash, who had listened with manifest satisfaction to the evidence, stepped into the box with all his original confidence restored. His selection of the true and the false thumb-prints was practically identical with that of Mr. Singleton, and his knowledge of this fact led him to state his conclusions with an air that was authoritative and even dogmatic.

“I am quite satisfied of the correctness of my statements,” he said, in reply to Anstey’s question, “and I am prepared to swear, and do swear, that those thumb-prints which I have stated to be forgeries, are forgeries, and that their detection presents no difficulty to an observer who has an expert acquaintance with finger-prints.”

“There is one question that I should like to ask,” said the judge, when the expert had left the box and Thorndyke had re-entered it to continue his evidence. “The conclusions of the expert witnesses—manifestly bona fide conclusions, arrived at by individual judgement, without collusion or comparison of results—are practically identical. They are virtually in complete agreement. Now, the strange thing is this: their conclusions are wrong in every instance” (here I nearly laughed aloud, for, as I glanced at the two experts, the expression of smug satisfaction on their countenances changed with lightning rapidity to a ludicrous spasm of consternation); “not sometimes wrong and sometimes right, as would have been the case if they had made mere guesses, but wrong every time. When they are quite certain, they are quite wrong; and when they are doubtful, they incline to the wrong conclusion. This is a very strange coincidence, Dr. Thorndyke. Can you explain it?”

Thorndyke’s face, which throughout the proceedings had been as expressionless as that of a wooden figurehead, now relaxed into a dry smile.

“I think I can, my lord,” he replied. “The object of a forger in executing a forgery is to produce deception on those who shall examine the forgery.”

“Oh!” said the judge; and his face relaxed into a dry smile, while the jury broke out into unconcealed grins.

“It was evident to me,” continued Thorndyke, “that the experts would be unable to distinguish the real from the forged thumb-prints, and, that being so, that they would look for some collateral evidence to guide them. I, therefore, supplied that collateral evidence. Now, if ten prints are taken, without special precautions, from a single finger, it will probably happen that no two of them are exactly alike; for the finger being a rounded object of which only a small part touches the paper, the impressions produced will show little variations according to the part of the finger by which the print is made. But a stamp such as I have used has a flat surface like that of a printer’s type, and, like a type, it always prints the same
impression. It does not reproduce the finger-tip, but a particular print of the finger, and so, if ten prints are made with a single stamp, each print will be a mechanical repetition of the other nine. Thus, on a sheet bearing twenty finger-prints, of which ten were forgeries made with a single stamp, it would be easy to pick out the ten forged prints by the fact that they would all be mechanical repetitions of one another; while the genuine prints could be distinguished by the fact of their presenting trifling variations in the position of the finger.

"Anticipating this line of reasoning, I was careful to make each print with a different stamp and each stamp was made from a different thumb-print, and I further selected thumb-prints which varied as widely as possible when I made the stamps. Moreover, when I made the real thumb-prints, I was careful to put the thumb down in the same position each time as far as I was able; and so it happened that, on the sheet submitted to the experts, the real thumb-prints were nearly all alike, while the forgeries presented considerable variations. The instances in which the witnesses were quite certain were those in which I succeeded in making the genuine prints repeat one another, and the doubtful cases were those in which I partially failed."

"Thank you, that is quite clear," said the judge, with a smile of deep content, such as is apt to appear on the judicial countenance when an expert witness is knocked off his pedestal. "We may now proceed, Mr. Anstey."

"You have told us," resumed Anstey, "and have submitted proofs, that it is possible to forge a thumb-print so that detection is impossible. You have also stated that the thumb-print on the paper found in Mr. Hornby's safe is a forgery. Do you mean that it may be a forgery, or that it actually is one?"

"I mean that it actually is a forgery."

"When did you first come to the conclusion that it was a forgery?"

"When I saw it at Scotland Yard. There are three facts which suggested this conclusion. In the first place the print was obviously produced with liquid blood, and yet it was a beautifully clear and distinct impression. But such an impression could not be produced with liquid blood without the use of a slab and roller, even if great care were used, and still less could it have been produced by an accidental smear.

In the second place, on measuring the print with a micrometer, I found that it did not agree in dimensions with a genuine thumb-print of Reuben Hornby. It was appreciably larger. I photographed the print with the micrometer in contact and on comparing this with a genuine thumb-print, also photographed with the same micrometer in contact, I found that the suspected print was larger by the fortieth of an inch, from one given point on the ridge-pattern to another given point. I have here enlargements of the two photographs in which the disagreement in size is clearly shown by the lines of the micrometer. I have also the micrometer itself and a portable microscope, if the Court wishes to verify the photographs."

"Thank you," said the judge, with a bland smile; "we will accept your sworn testimony unless the learned counsel for the prosecution demands verification."

He received the photographs which Thorndyke handed up and, having examined them with close attention, passed them on to the jury.

"The third fact," resumed Thorndyke, "is of much more importance, since it not only proves the print to be a forgery, but also furnishes a very distinct clue to the origin of the forgery, and so to the identity of the forger." (Here the court became hushed until the silence was so profound that the ticking of the clock seemed a sensible interruption. I glanced at Walter, who sat motionless and rigid at the end of the bench, and perceived that a horrible pallor had spread over his face, while his forehead was covered with beads of perspiration.) "On looking at the print closely, I noticed at one part a minute white mark or space. It was of the shape of a capital S and had evidently been produced by a defect in the paper—a loose fibre which had stuck to the thumb and been detached by it from the paper, leaving a blank space where it had been. But, on examining the paper under a low power of the microscope, I found the surface to be perfect and intact. No loose fibre had been detached from it, for if it had, the broken end or, at least, the groove in which it had lain, would have been visible. The inference seemed to be that the loose fibre had existed, not in the paper which was found in the safe, but in the paper on which the original thumb-mark had been made. Now, as far as I knew, there was only one undoubted thumb-print of Reuben Hornby's in existence—the one in the 'Thumbograph.' At my request, the 'Thumbograph' was brought to my chambers by Mrs. Hornby, and, on examining the print of Reuben Hornby's left thumb, I perceived on it a minute, S-shaped white space occupying a similar position to that in the red thumb-mark; and when I looked at it through a powerful lens, I could clearly see the little groove in the paper in which the fibre had lain and from which it had been lifted by the inked thumb. I subsequently made a systematic comparison of the marks in the two thumb-prints; I found that the dimensions of the mark were proportionally the same in each—that is to say, the mark in the 'Thumbograph' print had an extreme length of 26/1000 of an inch and an extreme breadth of 14.5/1000 of an inch, while that in the red thumb-mark was one-fortieth larger in each dimension, having an extreme length of 26.65/1000 of an inch and an extreme breadth of 14.86/1000 of an inch; that the shape was identical, as was shown by superimposing tracings of greatly enlarged photographs of each mark on similar enlargements of the other; and that the mark intersected the ridges of the thumb-print in the same manner and at exactly the same parts in the two prints."

"Do you say that—having regard to the facts which you have stated—it is certain that the red thumb-mark is a forgery?"

"I do; and I also say that it is certain that the forgery was executed by means of the 'Thumbograph.'"
“Might not the resemblances be merely a coincidence?”

“No. By the law of probabilities which Mr. Singleton explained so clearly in his evidence, the adverse chances would run into untold millions. Here are two thumb-prints made in different places and at different times—an interval of many weeks intervening. Each of them bears an accidental mark which is due not to any peculiarity of the thumb, but to a peculiarity of the paper. On the theory of coincidences it is necessary to suppose that each piece of paper had a loose fibre of exactly identical shape and size and that this fibre came, by accident, in contact with the thumb at exactly the same spot. But such a supposition would be more opposed to probabilities even than the supposition that two exactly similar thumb-prints should have been made by different persons. And then there is the further fact that the paper found in the safe had no loose fibre to account for the mark.”

“What is your explanation of the presence of defibrinated blood in the safe?”

“It was probably used by the forger in making the thumb-print, for which purpose fresh blood would be less suitable by reason of its clotting. He would probably have carried a small quantity in a bottle, together with the pocket slab and roller invented by Mr. Galton. It would thus be possible for him to put a drop on the slab, roll it out into a thin film and take a clean impression with his stamp. It must be remembered that these precautions were quite necessary, since he had to make a recognisable print at the first attempt. A failure and a second trial would have destroyed the accidental appearance, and might have aroused suspicion.”

“You have made some enlarged photographs of the thumb-prints, have you not?”

“Yes. I have here two enlarged photographs, one of the ‘Thumbograph’ print and one of the red thumb-print. They both show the white mark very clearly and will assist comparison of the originals, in which the mark is plainly visible through a lens.”

He handed the two photographs up to the judge, together with the ‘Thumbograph,’ the memorandum slip, and a powerful doublet lens with which to examine them.

The judge inspected the two original documents with the aid of the lens and compared them with the photographs, nodding approvingly as he made out the points of agreement. Then he passed them on to the jury and made an entry in his notes.

While this was going on my attention was attracted by Walter Hornby. An expression of terror and wild despair had settled on his face, which was ghastly in its pallor and bedewed with sweat. He looked furtively at Thorndyke and, as I noted the murderous hate in his eyes, I recalled our midnight adventure in John Street and the mysterious cigar.

Suddenly he rose to his feet, wiping his brow and steadying himself against the bench with a shaking hand; then he walked quietly to the door and went out. Apparently, I was not the only onlooker who had been interested in his doings, for, as the door swung to after him, Superintendent Miller rose from his seat and went out by the other door.

“Are you cross-examining this witness?” the judge inquired, glancing at Sir Hector Trumpler.

“No, my lord,” was the reply.

“Are you calling any more witnesses, Mr. Anstey?”

“Only one, my lord,” replied Anstey—“the prisoner, whom I shall put in the witness-box, as a matter of form, in order that he may make a statement on oath.”

Reuben was accordingly conducted from the dock to the witness-box, and, having been sworn, made a solemn declaration of his innocence. A brief cross-examination followed, in which nothing was elicited, but that Reuben had spent the evening at his club and gone home to his rooms about half-past eleven and had let himself in with his latchkey. Sir Hector at length sat down; the prisoner was led back to the dock, and the Court settled itself to listen to the speeches of the counsel.

“My lord and gentlemen of the jury,” Anstey commenced in his clear, mellow tones, “I do not propose to occupy your time with a long speech. The evidence that has been laid before you is at once so intelligible, so lucid, and so conclusive, that you will, no doubt, arrive at your verdict uninfluenced by any display of rhetoric either on my part or on the part of the learned counsel for the prosecution.

“Nevertheless, it is desirable to disentangle from the mass of evidence those facts which are really vital and crucial.

“Now the one fact which stands out and dominates the whole case is this: The prisoner’s connection with this case rests solely upon the police theory of the infallibility of finger-prints. Apart from the evidence of the thumb-print there is not, and there never was, the faintest breath of suspicion against him. You have heard him described as a man of unsullied honour, as a man whose character is above reproach; a man who is trusted implicitly by those who have had dealings with him. And this character was not given by a casual stranger, but by one who has known him from childhood. His record is an unbroken record of honourable conduct; his life has been that of a clean-living, straightforward gentleman. And now he stands before you charged with a miserable, paltry theft; charged with having robbed that generous friend, the brother of his own father, the guardian of his childhood and the benefactor who has planned and striven for his well-being; charged, in short, gentlemen, with a crime which every circumstance connected with him and every trait of his known character renders utterly inconceivable. Now upon what grounds has this gentleman of irreproachable character been charged with this mean and sordid crime? Baldly stated, the grounds of the accusation are these: A certain learned and eminent man of
science has made a statement, which the police have not merely accepted but have, in practice, extended beyond its original meaning. That statement is as follows: 'A complete, or nearly complete, accordance between two prints of a single finger... affords evidence requiring no corroboration, that the persons from whom they were made are the same.'

"That statement, gentlemen, is in the highest degree misleading, and ought not to have been made without due warning and qualification. So far is it from being true, in practice, that its exact contrary is the fact; the evidence of a fingerprint, in the absence of corroboration, is absolutely worthless. Of all forms of forgery, the forgery of a fingerprint is the easiest and most secure, as you have seen in this court to-day. Consider the character of the high-class forger—his skill, his ingenuity, his resource. Think of the forged banknotes, of which not only the engraving, the design and the signature, but even the very paper with its private watermarks, is imitated with a perfection that is at once the admiration and the despair of those who have to distinguish the true from the false; think of the forged cheque, in which actual perforations are filled up, of which portions are cut out bodily and replaced by indistinguishable patches; think of these, and then of a fingerprint, of which any photo-engraver's apprentice can make you a forgery that the greatest experts cannot distinguish from the original, which any capable amateur can imitate beyond detection after a month's practice; and then ask yourselves if this is the kind of evidence on which, without any support or corroboration, a gentleman of honour and position should be dragged before a criminal court and charged with having committed a crime of the basest and most sordid type.

"But I must not detain you with unnecessary appeals. I will remind you briefly of the salient facts. The case for the prosecution rests upon the assertion that the thumb-print found in the safe was made by the thumb of the prisoner. If that thumb-print was not made by the prisoner, there is not only no case against him but no suspicion of any kind.

"Now, was that thumb-print made by the prisoner's thumb? You have had conclusive evidence that it was not. That thumb-print differed in the size, or scale, of the pattern from a genuine thumb-print of the prisoner's. The difference was small, but it was fatal to the police theory; the two prints were not identical.

"But, if not the prisoner's thumb-print, what was it? The resemblance of the pattern was too exact for it to be the thumb-print of another person, for it reproduced not only the pattern of the ridges on the prisoner's thumb, but also the scar of an old wound. The answer that I propose to this question is, that it was an intentional imitation of the prisoner's thumb-print, made with the purpose of fixing suspicion on the prisoner, and so ensuring the safety of the actual criminal. Are there any facts which support this theory? Yes, there are several facts which support it very strongly.

"First, there are the facts that I have just mentioned. The red thumb-print disagreed with the genuine print in its scale or dimensions. It was not the prisoner's thumb-print; but neither was it that of any other person. The only alternative is that it was a forgery.

"In the second place, that print was evidently made with the aid of certain appliances and materials, and one of those materials, namely defibrinated blood, was found in the safe.

"In the third place, there is the coincidence that the print was one which it was possible to forge. The prisoner has ten digits—eight fingers and two thumbs. But there were in existence actual prints of the two thumbs, whereas no prints of the fingers were in existence; hence it would have been impossible to forge a print of any of the fingers. So it happens that the red thumb-print resembled one of the two prints of which forgery was possible.

"In the fourth place, the red thumb-print reproduces an accidental peculiarity of the 'Thumbograph' print. Now, if the red thumb-print is a forgery, it must have been made from the 'Thumbograph' print, since there exists no other print from which it could have been made. Hence we have the striking fact that the red thumb-print is an exact replica—including accidental peculiarities—of the only print from which a forgery could have been made. The accidental S-shaped mark in the 'Thumbograph' print is accounted for by the condition of the paper; the occurrence of this mark in the red thumb-print is not accounted for by any peculiarity of the paper, and can be accounted for in no way, except by assuming the one to be a copy of the other. The conclusion is thus inevitable that the red thumb-print is a photo-mechanical reproduction of the 'Thumbograph' print.

"But there is yet another point. If the red thumb-print is a forgery reproduced from the 'Thumbograph' print, the forger must at some time have had access to the 'Thumbograph.' Now, you have heard Mrs. Hornby's remarkable story of the mysterious disappearance of the 'Thumbograph' and its still more mysterious reappearance. That story can have left no doubt in your minds that some person had surreptitiously removed the 'Thumbograph' and, after an unknown interval, secretly replaced it. Thus the theory of forgery receives confirmation at every point, and is in agreement with every known fact; whereas the theory that the red thumb-print was a genuine thumb-print, is based upon a gratuitous assumption, and has not had a single fact advanced in its support.

"Accordingly, gentlemen, I assert that the prisoner's innocence has been proved in the most complete and convincing manner, and I ask you for a verdict in accordance with that proof."

As Anstey resumed his seat, a low rumble of applause was heard from the gallery. It subsided instantly on a gesture of disapproval from the judge, and a silence fell upon the court, in which the clock, with cynical indifference, continued to record in its brusque monotonie the passage of the fleeting seconds.

"He is saved, Dr. Jervis! Oh! surely he is saved!" Juliet exclaimed in an agitated whisper. "They must see that he is innocent now."

"Have patience a little longer," I answered. "It will soon be over now."
Sir Hector Trumpler was already on his feet and, after bestowing on the jury a stern hypnotic stare, he plunged into his reply with a really admirable air of conviction and sincerity.

"My lord and gentlemen of the jury: The case which is now before this Court is one, as I have already remarked, in which human nature is presented in a highly unfavourable light. But I need not insist upon this aspect of the case, which will already, no doubt, have impressed you sufficiently. It is necessary merely for me, as my learned friend has aptly expressed it, to disentangle the actual facts of the case from the web of casuistry that has been woven around them.

"Those facts are of extreme simplicity. A safe has been opened and property of great value abstracted from it. It has been opened by means of false keys. Now there are two men who have, from time to time, had possession of the true keys, and thus had the opportunity of making copies of them. When the safe is opened by its rightful owner, the property is gone, and there is found the print of the thumb of one of these two men. That thumb-print was not there when the safe was closed. The man whose thumb-print is found is a left-handed man; the print is the print of a left thumb. It would seem, gentlemen, as if the conclusion were so obvious that no sane person could be found to contest it; and I submit that the conclusion which any sane person would arrive at—the only possible conclusion—is, that the person whose thumb-print was found in the safe is the person who stole the property from the safe. But the thumb-print was, admittedly, that of the prisoner at the bar, and therefore the prisoner at the bar is the person who stole the diamonds from the safe.

"It is true that certain fantastic attempts have been made to explain away these obvious facts. Certain far-fetched scientific theories have been propounded and an exhibition of legerdemain has taken place which, I venture to think, would have been more appropriate to some place of public entertainment than to a court of justice. That exhibition has, no doubt, afforded you considerable amusement. It has furnished a pleasing relaxation from the serious business of the court. It has even been instructive, as showing to what extent it is possible for plain facts to be perverted by misdirected ingenuity. But unless you are prepared to consider this crime as an elaborate hoax—as a practical joke carried out by a facetious criminal of extraordinary knowledge, skill and general attainments—you must, after all, come to the only conclusion that the facts justify: that the safe was opened and the property abstracted by the prisoner. Accordingly, gentlemen, I ask you, having regard to your important position as the guardians of the well-being and security of your fellow-citizens, to give your verdict in accordance with the evidence, as you have solemnly sworn to do; which verdict, I submit, can be no other than that the prisoner is guilty of the crime with which he is charged."

Sir Hector sat down, and the jury, who had listened to his speech with solid attention, gazed expectantly at the judge, as though they should say: "Now, which of these two are we to believe?"

The judge turned over his notes with an air of quiet composure, writing down a word here and there as he compared the various points in the evidence. Then he turned to the jury with a manner at once persuasive and confidential—

"It is not necessary, gentlemen," he commenced, "for me to occupy your time with an exhaustive analysis of the evidence. That evidence you yourselves have heard, and it has been given, for the most part, with admirable clearness. Moreover, the learned counsel for the defence has collated and compared that evidence so lucidly, and, I may say, so impartially, that a detailed repetition on my part would be superfluous. I shall therefore confine myself to a few comments which may help you in the consideration of your verdict.

"I need hardly point out to you that the reference made by the learned counsel for the prosecution to far-fetched scientific theories is somewhat misleading. The only evidence of a theoretical character was that of the finger-print experts. The evidence of Dr. Rowe and of Dr. Thorndyke dealt exclusively with matters of fact. Such inferences as were drawn by them were accompanied by statements of the facts which yielded such inferences.

"Now, an examination of the evidence which you have heard shows, as the learned counsel for the defence has justly observed, that the entire case resolves itself into a single question, which is this: Was the thumb-print that was found in Mr. Hornby's safe made by the thumb of the prisoner, or was it not? If that thumb-print was made by the prisoner's thumb, then the prisoner must, at least, have been present when the safe was unlawfully opened. If that thumb-print was not made by the prisoner's thumb, there is nothing to connect him with the crime. The question is one of fact upon which it will be your duty to decide; and I must remind you, gentlemen, that you are the sole judges of the facts of the case, and that you are to consider any remarks of mine as merely suggestions which you are to entertain or to disregard according to your judgement.

"Now let us consider this question by the light of the evidence. This thumb-print was either made by the prisoner or it was not. What evidence has been brought forward to show that it was made by the prisoner? Well, there is the evidence of the ridge-pattern. That pattern is identical with the pattern of the prisoner's thumb-print, and even has the impression of a scar which crosses the pattern in a particular manner in the prisoner's thumb-print. There is no need to enter into the elaborate calculations as to the chances of agreement; the practical fact, which is not disputed, is that if this red thumb-print is a genuine thumb-print at all, it was made by the prisoner's thumb. But it is contended that it is not a genuine thumb-print; that it is a mechanical imitation—in fact a forgery.

"The more general question thus becomes narrowed down to the more particular question: 'Is this a genuine thumb-print or is it a forgery?' Let us consider the evidence. First, what evidence is there that it is a genuine thumb-print? There is none. The identity of the pattern is no evidence on this point, because a forgery would also exhibit identity of pattern. The genuineness of the thumb-print was assumed by the prosecution, and no evidence has been offered.

"But now what evidence is there that the red thumb-print is a forgery?
“First, there is the question of size. Two different-sized prints could hardly be made by the same thumb. Then there is the evidence of the use of appliances. Safe-robbers do not ordinarily provide themselves with inking-slabs and rollers with which to make distinct impressions of their own fingers. Then there is the accidental mark on the print which also exists on the only genuine print that could have been used for the purpose of forgery, which is easily explained on the theory of a forgery, but which is otherwise totally incomprehensible. Finally, there is the strange disappearance of the ‘Thumbograph’ and its strange reappearance. All this is striking and weighty evidence, to which must be added that adduced by Dr. Thorndyke as showing how perfectly it is possible to imitate a finger-print.

“These are the main facts of the case, and it is for you to consider them. If, on careful consideration, you decide that the red thumb-print was actually made by the prisoner’s thumb, then it will be your duty to pronounce the prisoner guilty; but if, on weighing the evidence, you decide that the thumb-print is a forgery, then it will be your duty to pronounce the prisoner not guilty. It is now past the usual luncheon hour, and, if you desire it, you can retire to consider your verdict while the Court adjourns.”

The jurymen whispered together for a few moments and then the foreman stood up.

“We have agreed on our verdict, my lord,” he said.

The prisoner, who had just been led to the back of the dock, was now brought back to the bar. The grey-wigged clerk of the court stood up and addressed the jury.

“Are you all agreed upon your verdict, gentlemen?”

“We are,” replied the foreman.

“What do you say, gentlemen? Is the prisoner guilty or not guilty?”

“Not guilty,” replied the foreman, raising his voice and glancing at Reuben.

A storm of applause burst from the gallery and was, for the moment, disregarded by the judge. Mrs. Hornby laughed aloud—a strange, unnatural laugh—and then crammed her handkerchief into her mouth, and sat gazing at Reuben with the tears coursing down her face, while Julia laid her head upon the desk and sobbed silently.

After a brief space the judge raised an admonitory hand, and, when the commotion had subsided, addressed the prisoner, who stood at the bar, calm and self-possessed, though his face bore a slight flush—

“Reuben Hornby, the jury, after duly weighing the evidence in this case, have found you to be not guilty of the crime with which you were charged. With that verdict I most heartily agree. In view of the evidence which has been given, I consider that no other verdict was possible, and I venture to say that you leave this court with your innocence fully established, and without a stain upon your character. In the distress which you have recently suffered, as well as in your rejoicing at the verdict of the jury, you have the sympathy of the Court, and of everyone present, and that sympathy will not be diminished by the consideration that, with a less capable defence, the result might have been very different.

“I desire to express my admiration at the manner in which that defence was conducted, and I desire especially to observe that not you alone, but the public at large, are deeply indebted to Dr. Thorndyke, who, by his insight, his knowledge and his ingenuity, has probably averted a very serious miscarriage of justice. The Court will now adjourn until half-past two.”

The judge rose from his seat and everyone present stood up; and, amidst the clamour of many feet upon the gallery stairs, the door of the dock was thrown open by a smiling police officer and Reuben came down the stairs into the body of the court.

XVII. — AT LAST

“WE had better let the people clear off,” said Thorndyke, when the first greetings were over and we stood around Reuben in the fast-emptying court. “We don’t want a demonstration as we go out.”

“No; anything but that, just now,” replied Reuben. He still held Mrs. Hornby’s hand, and one arm was passed through that of his uncle, who wiped his eyes at intervals, though his face glowed with delight.

“I should like you to come and have a little quiet luncheon with me at my chambers—all of us friends together,” continued Thorndyke.

“I should be delighted,” said Reuben, “if the programme would include a satisfactory wash.”

“You will come, Anstey?” asked Thorndyke.

“What have you got for lunch?” demanded Anstey, who was now disrobed and in his right mind—that is to say, in his usual whimsical, pseudo-frivolous character.

“That question savours of gluttony,” answered Thorndyke. “Come and see.”

“I will come and eat, which is better,” answered Anstey, “and I must run off now, as I have to look in at my chambers.”

“How shall we go?” asked Thorndyke, as his colleague vanished through the doorway. “Polton has gone for a four-wheeler, but it won’t hold us all.”
“It will hold four of us,” said Reuben, “and Dr. Jervis will bring Juliet; won’t you, Jervis?”

The request rather took me aback, considering the circumstances, but I was conscious, nevertheless, of an unreasonable thrill of pleasure and answered with alacrity: “If Miss Gibson will allow me, I shall be very delighted.” My delight was, apparently, not shared by Juliet, to judge by the uncomfortable blush that spread over her face. She made no objection, however, but merely replied rather coldly: “Well, as we can’t sit on the roof of the cab, we had better go by ourselves.”

The crowd having by this time presumably cleared off, we all took our way downstairs. The cab was waiting at the kerb, surrounded by a group of spectators, who cheered Reuben as he appeared at the doorway, and we saw our friends enter and drive away. Then we turned and walked quickly down the Old Bailey towards Ludgate Hill.

“Shall we take a hansom?” I asked.

“No; let us walk,” replied Juliet; “a little fresh air will do us good after that musty, horrible court. It all seems like a dream, and yet what a relief—oh! what a relief it is.”

“It is rather like the awakening from a nightmare to find the morning sun shining,” I rejoined.

“Yes; that is just what it is like,” she agreed; “but I still feel dazed and shaken.”

We turned presently down New Bridge Street, towards the Embankment, walking side by side without speaking, and I could not help comparing, with some bitterness, our present stiff and distant relations with the intimacy and comradeship that had existed before the miserable incident of our last meeting.

“You don’t look so jubilant over your success as I should have expected,” she said at length, with a critical glance at me; “but I expect you are really very proud and delighted, aren’t you?”

“Delighted, yes; not proud. Why should I be proud? I have only played jackal, and even that I have done very badly.”

“That is hardly a fair statement of the facts,” she rejoined, with another quick, inquisitive look at me; “but you are in low spirits to-day—which is not at all like you. Is it not so?”

“I am afraid I am a selfish, egotistical brute,” was my gloomy reply. “I ought to be as gay and joyful as everyone else to-day, whereas the fact is that I am chafing over my own petty troubles. You see, now that this case is finished, my engagement with Dr. Thorndyke terminates automatically, and I relapse into my old life—a dreary repetition of journeying amongst strangers—and the prospect is not inspiring. This has been a time of bitter trial to you, but to me it has been a green oasis in the desert of a colourless, monotonous life. I have enjoyed the companionship of a most lovable man, whom I admire and respect above all other men, and with him have moved in scenes full of colour and interest. And I have made one other friend whom I am loth to see fade out of my life, as she seems likely to do.”

“If you mean me,” said Juliet, “I may say that it will be your own fault if I fade out of your life. I can never forget all that you have done for us, your loyalty to Reuben, your enthusiasm in his cause, to say nothing of your many kindnesses to me. And, as to your having done your work badly, you wrong yourself grievously. I recognised in the evidence by which Reuben was cleared to-day how much you had done, in filling in the details, towards making the case complete and convincing. I shall always feel that we owe you a debt of the deepest gratitude, and so will Reuben, and so, perhaps, more than either of us, will someone else.”

“And who is that?” I asked, though with no great interest. The gratitude of the family was a matter of little consequence to me.

“Well, it is no secret now,” replied Juliet. “I mean the girl whom Reuben is going to marry. What is the matter, Dr. Jervis?” she added, in a tone of surprise.

We were passing through the gate that leads from the Embankment to Middle Temple Lane, and I had stopped dead under the archway, laying a detaining hand upon her arm and gazing at her in utter amazement.

“The girl that Reuben is going to marry!” I repeated. “Why, I had always taken it for granted that he was going to marry you.”

“But I told you, most explicitly, that was not so!” she exclaimed with some impatience.

“I know you did,” I admitted ruefully; “but I thought—well, I imagined that things had, perhaps, not gone quite smoothly and—”

“Did you suppose that if I had cared for a man, and that man had been under a cloud, I should have denied the relation or pretended that we were merely friends?” she demanded indignantly.

“I am sure you wouldn’t,” I replied hastily. “I was a fool, an idiot—by Jove, what an idiot I have been!”

“It was certainly very silly of you,” she admitted; but there was a gentleness in her tone that took away all bitterness from the reproach.

“The reason of the secrecy was this,” she continued; “they became engaged the very night before Reuben was arrested, and, when he heard of the charge against him, he insisted that no one should be told unless, and until, he was fully acquitted. I was the only person who was in their confidence, and as I was sworn to secrecy, of course I couldn’t tell you; nor did I suppose that the matter would interest you. Why should it?”
“Imbecile that I am,” I murmured. “If I had only known!”

“Well, if you had known,” said she; “what difference could it have made to you?”

This question she asked without looking at me, but I noted that her cheek had grown a shade paler.

“Only this,” I answered. “That I should have been spared many a day and night of needless self-reproach and misery.”

“But why?” she asked, still keeping her face averted. “What had you to reproach yourself with?”

“A great deal,” I answered, “if you consider my supposed position. If you think of me as the trusted agent of a man, helpless and deeply wronged—a man whose undeserved misfortunes made every demand upon chivalry and generosity; if you think of me as being called upon to protect and carry comfort to the woman whom I regarded as, virtually, that man’s betrothed wife; and then if you think of me as proceeding straightway, before I had known her twenty-four hours, to fall hopelessly in love with her myself, you will admit that I had something to reproach myself with.”

She was still silent, rather pale and very thoughtful, and she seemed to breathe more quickly than usual.

“Of course,” I continued, “you may say that it was my own look-out, that I had only to keep my own counsel, and no one would be any the worse. But there’s the mischief of it. How can a man who is thinking of a woman morning, noon and night; whose heart leaps at the sound of her coming, whose existence is a blank when she is away from him—a blank which he tries to fill by recalling, again and again, all that she has said and the tones of her voice, and the look that was in her eyes when she spoke—how can he help letting her see, sooner or later, that he cares for her? And if he does, when he has no right to, there is an end of duty and chivalry and even common honesty.”

“Yes, I understand now,” said Juliet softly. “Is this the way?” She tripped up the steps leading to Fountain Court and I followed cheerfully. Of course it was not the way, and we both knew it, but the place was silent and peaceful, and the plane-trees cast a pleasant shade on the gravelled court. I glanced at her as we walked slowly towards the fountain. The roses were mantling in her cheeks now and her eyes were cast down, but when she lifted them to me for an instant, I saw that they were shining and moist.

“Did you never guess?” I asked.

“Yes,” she replied in a low voice, “I guessed; but—but then,” she added shyly, “I thought I had guessed wrong.”

We walked on for some little time without speaking again until we came to the further side of the fountain, where we stood listening to the quiet trickle of the water, and watching the sparrows as they took their bath on the rim of the basin. A little way off another group of sparrows had gathered with greedy joy around some fragments of bread that had been scattered abroad by the benevolent Templars, and hard by a more sentimentally-minded pigeon, unmindful of the crumbs and the marauding sparrows, puffed out his breast and strutted and curtsied before his mate with endearing gurgles.

Juliet had rested her hand on one of the little posts that support the chain by which the fountain is enclosed and I had laid my hand on hers. Presently she turned her hand over so that mine lay in its palm; and so we were standing hand-in-hand when an elderly gentleman, of dry and legal aspect, came up the steps and passed by the fountain. He looked at the pigeons and then he looked at us, and went his way smiling and shaking his head.

“Juliet,” said I.

She looked up quickly with sparkling eyes and a frank smile that was yet a little shy, too.

“Yes.”

“Why did he smile—that old gentleman—when he looked at us?”

“I can’t imagine,” she replied mendaciously.

“It was an approving smile,” I said. “I think he was remembering his own spring-time and giving us his blessing.”

“Perhaps he was,” she agreed. “He looked a nice old thing.” She gazed fondly at the retreating figure and then turned again to me. Her cheeks had grown pink enough by now, and in one of them a dimple displayed itself to great advantage in its rosy setting.

“Can you forgive me, dear, for my unutterable folly?” I asked presently, as she glanced up at me again.

“I am not sure,” she answered. “It was dreadfully silly of you.”

“But remember, Juliet, that I loved you with my whole heart—as I love you now and shall love you always.”

“I can forgive you anything when you say that,” she answered softly.

Here the voice of the distant Temple clock was heard uttering a polite protest. With infinite reluctance we turned away from the fountain, which sprinkled us with a parting benediction, and slowly retraced our steps to Middle Temple Lane and thence into Pump Court.

“You haven’t said it, Juliet,” I whispered, as we came through the archway into the silent, deserted court.

“Haven’t I, dear?” she answered; “but you know it, don’t you? You know I do.”

“Yes, I know,” I said; “and that knowledge is all my heart’s desire.” She laid her hand in mine for a moment with a gentle pressure and then drew it away; and so we passed through into the cloisters.
I. — THE MAN WITH THE NAILED SHOES

THERE are, I suppose, few places even on the East Coast of England more lonely and remote than the village of Little Sundersley and the country that surrounds it. Far from any railway, and some miles distant from any considerable town, it remains an outpost of civilization, in which primitive manners and customs and old-world tradition linger on into an age that has elsewhere forgotten them. In the summer, it is true, a small contingent of visitors, adventurous in spirit, though mostly of sedate and solitary habits, make their appearance to swell its meagre population, and impart to the wide stretches of smooth sand that fringe its shores a fleeting air of life and sober gaiety; but in late September—the season of
the year in which I made its acquaintance—its pasture-lands lie desolate, the rugged paths along the cliffs are seldom trodden by human foot, and the sands are a desert waste on which, for days together, no footprint appears save that left by some passing sea-bird.

I had been assured by my medical agent, Mr. Turcival, that I should find the practice of which I was now taking charge “an exceedingly soft billet, and suitable for a studious man;” and certainly he had not misled me, for the patients were, in fact, so few that I was quite concerned for my principal, and rather dull for want of work. Hence, when my friend John Thorndyke, the well-known medico-legal expert, proposed to come down and stay with me for a weekend and perhaps a few days beyond, I hailed the proposal with delight, and welcomed him with open arms.

“You certainly don’t seem to be overworked, Jervis,” he remarked, as we turned out of the gate after tea, on the day of his arrival, for a stroll on the shore. “Is this a new practice, or an old one in a state of senile decay?”

“Why, the fact is,” I answered, “there is virtually no practice. Cooper—my principal—has been here about six years, and as he has private means he has never made any serious effort to build one up; and the other man, Dr. Burrows, being uncommonly keen, and the people very conservative, Cooper has never really got his foot in. However, it doesn’t seem to trouble him.”

“Well, if he is satisfied, I suppose you are,” said Thorndyke, with a smile. “You are getting a seaside holiday, and being paid for it. But I didn’t know you were as near to the sea as this.”

We were entering, as he spoke, an artificial gap-way cut through the low cliff, forming a steep cart-track down to the shore. It was locally known as Sundersley Gap, and was used principally, when used at all, by the farmers’ carts which came down to gather seaweed after a gale.

“What a magnificent stretch of sand!” continued Thorndyke, as we reached the bottom, and stood looking out seaward across the deserted beach. “There is something very majestic and solemn in a great expanse of sandy shore when the tide is out, and I know of nothing which is capable of conveying the impression of solitude so completely. The smooth, unbroken surface not only displays itself untenanted for the moment, but it offers convincing testimony that it has lain thus undisturbed through a considerable lapse of time. Here, for instance, we have clear evidence that for several days only two pairs of feet besides our own have trodden this gap.”

“How do you arrive at the ‘several days’?” I asked.

“In the simplest manner possible,” he replied. “The moon is now in the third quarter, and the tides are consequently neap-tides. You can see quite plainly the two lines of seaweed and jetsam which indicate the high-water marks of the spring-tides and the neap-tides respectively. The strip of comparatively dry sand between them, over which the water has not risen for several days, is, as you see, marked by only two sets of footprints, and those footprints will not be completely obliterated by the sea until the next spring-tide—nearly a week from to-day.”

“Yes, I see now, and the thing appears obvious enough when one has heard the explanation. But it is really rather odd that no one should have passed through this gap for days, and then that four persons should have come here within quite a short interval of one another.”

“What makes you think they have done so?” Thorndyke asked.

“Well,” I replied, “both of these sets of footprints appear to be quite fresh, and to have been made about the same time.”

“Not at the same time, Jervis,” rejoined Thorndyke. “There is certainly an interval of several hours between them, though precisely how many hours we cannot judge, since there has been so little wind lately to disturb them; but the fisherman unquestionably passed here not more than three hours ago, and I should say probably within an hour; whereas the other man—who seems to have come up from a boat to fetch something of considerable weight—returned through the gap certainly not less, and probably more, than four hours ago.”

I gazed at my friend in blank astonishment, for these events befell in the days before I had joined him as his assistant, and his special knowledge and powers of inference were not then fully appreciated by me.

“It is clear, Thorndyke,” I said, “that footprints have a very different meaning to you from what they have for me. I don’t see in the least how you have reached any of these conclusions.”

“I suppose not,” was the reply; “but, you see, special knowledge of this kind is the stock-in-trade of the medical jurist, and has to be acquired by special study, though the present example is one of the greatest simplicity. But let us consider it point by point; and first we will take this set of footprints which I have inferred to be a fisherman’s. Note their enormous size. They should be the footprints of a giant. But the length of the stride shows that they were made by a rather short man. Then observe the massiveness of the soles, and the fact that there are no nails in them. Note also the peculiar clumsy tread—the deep toe and heel marks, as if the walker had wooden legs, or fixed ankles and knees. From that character we can safely infer high boots of thick, rigid leather, so that we can diagnose high boots, massive and stiff, with naillage soles, and many sizes too large for the wearer. But the only boot that answers this description is the fisherman’s thigh-boot—made of enormous size to enable him to wear in the winter two or three pairs of thick knitted stockings, one over the other. Now look at the other footprints; there is a double track, you see, one set coming from the sea and one going towards it. As the man (who was bow-legged and turned his toes in) has trodden in his own footprints, it is obvious that he came from the sea, and returned to it. But observe the difference in the two sets of prints; the returning ones are much deeper than the others, and the stride much shorter. Evidently he was carrying something when he returned, and that something was very
heavy. Moreover, we can see, by the greater depth of the toe impressions, that he was stooping forward as he walked, and so probably carried the weight on his back. Is that quite clear?"

"Perfectly," I replied. "But how do you arrive at the interval of time between the visits of the two men?"

"That also is quite simple. The tide is now about halfway out; it is thus about three hours since high water. Now, the fisherman walked just about the neap-tide, high-water mark, sometimes above it and sometimes below. But none of his footprints have been obliterated; therefore he passed after high water—that is, less than three hours ago; and since his footprints are all equally distinct, he could not have passed when the sand was very wet. Therefore he probably passed less than an hour ago. The other man's footprints, on the other hand, reach only to the neap-tide, high-water mark, where they end abruptly. The sea has washed over the remainder of the tracks and obliterated them. Therefore he passed not less than three hours and not more than four days ago—probably within twenty-four hours."

As Thorndyke concluded his demonstration the sound of voices was borne to us from above, mingled with the trampling of feet, and immediately afterwards a very singular party appeared at the head of the gap descending towards the shore. First came a short burly fisherman clad in oilskins and sou'-wester, clumping along awkwardly in his great sea-boots, then the local police-sergeant in company with my professional rival Dr. Burrows, while the rear of the procession was brought up by two constables carrying a stretcher. As he reached the bottom of the gap the fisherman, who was evidently acting as guide, turned along the shore, retracing his own tracks, and the procession followed in his wake.

"A surgeon, a stretcher, two constables, and a police-sergeant," observed Thorndyke. "What does that suggest to your mind, Jervis?"

"A fall from the cliff," I replied, "or a body washed up on the shore."

"Probably," he rejoined; "but we may as well walk in that direction."

We turned to follow the retreating procession, and as we strode along the smooth surface left by the retiring tide Thorndyke resumed:

"The subject of footprints has always interested me deeply for two reasons. First, the evidence furnished by footprints is constantly being brought forward, and is often of cardinal importance; and, secondly, the whole subject is capable of really systematic and scientific treatment. In the main the data are anatomical, but age, sex, occupation, health, and disease all give their various indications. Clearly, for instance, the footprints of an old man will differ from those of a young man of the same height, and I need not point out to you that those of a person suffering from locomotor ataxia or paralysis agitans would be quite unmistakable."

"Yes, I see that plainly enough," I said.

"Here, now," he continued, "is a case in point." He halted to point with his stick at a row of footprints that appeared suddenly above high-water mark, and having proceeded a short distance, crossed the line again, and vanished where the waves had washed over them. They were easily distinguished from any of the others by the clear impressions of circular rubber heels.

"Do you see anything remarkable about them?" he asked.

"I notice that they are considerably deeper than our own," I answered.

"Yes, and the boots are about the same size as ours, whereas the stride is considerably shorter—quite a short stride, in fact. Now there is a pretty constant ratio between the length of the foot and the length of the leg, between the length of leg and the height of the person, and between the stature and the length of stride. A long foot means a long leg, a tall man, and a long stride. But here we have a long foot and a short stride. What do you make of that?" He laid down his stick—a smooth partridge cane, one side of which was marked by small lines into inches and feet—beside the footprints to demonstrate the discrepancy.

"The depth of the footprints shows that he was a much heavier man than either of us," I suggested; "perhaps he was unusually fat."

"Yes," said Thorndyke, "that seems to be the explanation. The carrying of a dead weight shortens the stride, and fat is practically a dead weight. The conclusion is that he was about five feet ten inches high, and excessively fat." He picked up his cane, and we resumed our walk, keeping an eye on the procession ahead until it had disappeared round a curve in the coast-line, when we mended our pace somewhat. Presently we reached a small headland, and, turning the shoulder of cliff, came full upon the party which had preceded us. The men had halted in a narrow bay, and now stood looking down at a prostrate figure beside which the surgeon was kneeling.

"We were wrong, you see," observed Thorndyke. "He has not fallen over the cliff, nor has he been washed up by the sea. He is lying above high-water mark, and those footprints that we have been examining appear to be his."

As we approached, the sergeant turned and held up his hand.

"I'll ask you not to walk round the body just now, gentlemen," he said. "There seems to have been foul play here, and I want to be clear about the tracks before anyone crosses them."

Acknowledging this caution, we advanced to where the constables were standing, and looked down with some curiosity at the dead man. He was a tall, frail-looking man, thin to the point of emaciation, and appeared to be about thirty-five
years of age. He lay in an easy posture, with half-closed eyes and a placid expression that contrasted strangely enough with the tragic circumstances of his death.

“IT is a clear case of murder,” said Dr. Burrows, dusting the sand from his knees as he stood up. “There is a deep knife-wound above the heart, which must have caused death almost instantaneously.”

“How long should you say he has been dead, Doctor?” asked the sergeant.

“Twelve hours at least,” was the reply. “He is quite cold and stiff.”

---

Plan of St. Bridget’s Bay.

“Twelve hours, eh?” repeated the officer. “That would bring it to about six o’clock this morning.”

“I won’t commit myself to a definite time,” said Dr. Burrows hastily. “I only say not less than twelve hours. It might have been considerably more.”

“Ah!” said the sergeant. “Well, he made a pretty good fight for his life, to all appearances.” He nodded at the sand, which for some feet around the body bore the deeply indented marks of feet, as though a furious struggle had taken place. “It’s a mighty queer affair,” pursued the sergeant, addressing Dr. Burrows. “There seems to have been only one man in it—they is only one set of footprints besides those of the deceased—and we’ve got to find out who he is; and I reckon there won’t be much trouble about that, seeing the kind of trade-marks he has left behind him.”

“No,” agreed the surgeon; “there ought not to be much trouble in identifying those boots. He would seem to be a labourer, judging by the hob-nails.”

“No, sir; not a labourer,” dissented the sergeant. “The foot is too small, for one thing; and then the nails are not regular hob-nails. They’re a good deal smaller; and a labourer’s boots would have the nails all round the edges, and there would be iron tips on the heels, and probably on the toes too. Now these have got no tips, and the nails are arranged in a pattern on the soles and heels. They are probably shooting-boots or sporting shoes of some kind.” He strode to and fro with his notebook in his hand, writing down hasty memoranda, and stooping to scrutinize the impressions in the sand. The surgeon also busied himself in noting down the facts concerning which he would have to give evidence, while Thorndyke regarded in silence and with an air of intense preoccupation the footprints around the body which remained to testify to the circumstances of the crime.

“It is pretty clear, up to a certain point,” the sergeant observed, as he concluded his investigations, “how the affair happened, and it is pretty clear, too, that the murder was premeditated. You see, Doctor, the deceased gentleman, Mr. Hearn, was apparently walking home from Port Marston; we saw his footprints along the shore—those rubber heels make them easy to identify—and he didn’t go down Sundersley Gap. He probably meant to climb up the cliff by that little track that you see there, which the people about here call the Shepherd’s Path. Now the murderer must have known that he was coming, and waited upon the cliff to keep a lookout. When he saw Mr. Hearn enter the bay, he came down the path and attacked him, and, after a tough struggle, succeeded in stabbing him. Then he turned and went back up the path. You can see the double track between the path and the place where the struggle took place, and the footprints going to the path are on top of those coming from it.”

“If you follow the tracks,” said Dr. Burrows, “you ought to be able to see where the murderer went to.”
"I'm afraid not," replied the sergeant. "There are no marks on the path itself—the rock is too hard, and so is the ground above, I fear. But I'll go over it carefully all the same."

The investigations being so far concluded, the body was lifted on to the stretcher, and the cortège, consisting of the bearers, the Doctor, and the fisherman, moved off towards the Gap, while the sergeant, having civilly wished us "Good-evening," scrambled up the Shepherd's Path, and vanished above.

"A very smart officer that," said Thorndyke. "I should like to know what he wrote in his notebook."

"His account of the circumstances of the murder seemed a very reasonable one," I said.

"Very. He noted the plain and essential facts, and drew the natural conclusions from them. But there are some very singular features in this case; so singular that I am disposed to make a few notes for my own information."

He stooped over the place where the body had lain, and having narrowly examined the sand there and in the place where the dead man's feet had rested, drew out his notebook and made a memorandum. He next made a rapid sketch-plan of the bay, marking the position of the body and the various impressions in the sand, and then, following the double track leading from and to the Shepherd's Path, scrutinized the footprints with the deepest attention, making copious notes and sketches in his book.

"We may as well go up by the Shepherd's Path," said Thorndyke. "I think we are equal to the climb, and there may be visible traces of the murderer after all. The rock is only a sandstone, and not a very hard one either."

We approached the foot of the little rugged track which zigzagged up the face of the cliff, and, stooping down among the stiff, dry herbage, examined the surface. Here, at the bottom of the path, where the rock was softened by the weather, there were several distinct impressions on the crumbling surface of the murderer's nailed boots, though they were somewhat confused by the tracks of the sergeant, whose boots were heavily nailed. But as we ascended the marks became rather less distinct, and at quite a short distance from the foot of the cliff we lost them altogether, though we had no difficulty in following the more recent traces of the sergeant's passage up the path.

When we reached the top of the cliff we paused to scan the path that ran along its edge, but here, too, although the sergeant's heavy boots had left quite visible impressions on the ground, there were no signs of any other feet. At a little distance the sagacious officer himself was pursuing his investigations, walking backwards and forwards with his body bent double, and his eyes fixed on the ground.

"Not a trace of him anywhere," said he, straightening himself up as we approached. "I was afraid there wouldn't be after all this dry weather. I shall have to try a different tack. This is a small place, and if those boots belong to anyone living here they'll be sure to be known."

"The deceased gentleman—Mr. Hearn, I think you called him," said Thorndyke as we turned towards the village—"is he a native of the locality?"

"Oh no, sir," replied the officer. "He is almost a stranger. He has only been here about three weeks; but, you know, in a little place like this a man soon gets to be known—and his business, too, for that matter," he added, with a smile.

"What was his business, then?" asked Thorndyke.

"Pleasure, I believe. He was down here for a holiday, though it's a good way past the season; but, then, he had a friend living here, and that makes a difference. Mr. Draper up at the Poplars was an old friend of his, I understand. I am going to call on him now."

We walked on along the footpath that led towards the village, but had only proceeded two or three hundred yards when a loud hail drew our attention to a man running across a field towards us from the direction of the cliff.

"Why, here is Mr. Draper himself," exclaimed the sergeant, stopping short and waving his hand. "I expect he has heard the news already."

Thorndyke and I also halted, and with some curiosity watched the approach of this new party to the tragedy. As the stranger drew near we saw that he was a tall, athletic-looking man of about forty, dressed in a Norfolk knickerbocker suit, and having the appearance of an ordinary country gentleman, excepting that he carried in his hand, in place of a walking-stick, the staff of a butterfly-net, the folding ring and bag of which partly projected from his pocket.

"Is it true, Sergeant?" he exclaimed as he came up to us, panting from his exertions. "About Mr. Hearn, I mean. There is a rumour that he has been found dead on the beach."

"It's quite true, sir, I am sorry to say; and, what is worse, he has been murdered."

"My God! you don't say so!"

He turned towards us a face that must ordinarily have been jovial enough, but was now white and scared and, after a brief pause, he exclaimed:

"Murdered! Good God! Poor old Hearn! How did it happen, Sergeant? and when? and is there any clue to the murderer?"

"We can't say for certain when it happened," replied the sergeant, "and as to the question of clues, I was just coming up to call on you."
"On me!" exclaimed Draper, with a startled glance at the officer. "What for?"

"Well, we should like to know something about Mr. Hearn—who he was, and whether he had any enemies, and so forth; anything, in fact, that would give as a hint where to look for the murderer. And you are the only person in the place who knew him at all intimately."

Mr. Draper's pallid face turned a shade paler, and he glanced about him with an obviously embarrassed air.

"I'm afraid," he began in a hesitating manner, "I'm afraid I shan't be able to help you much. I didn't know much about his affairs. You see he was—well—only a casual acquaintance—"

"Well," interrupted the sergeant, "you can tell us who and what he was, and where he lived, and so forth. We'll find out the rest if you give us the start."

"I see," said Draper. "Yes, I expect you will." His eyes glanced restlessly to and fro, and he added presently: "You must come up to-morrow, and have a talk with me about him, and I'll see what I can remember."

"I'd rather come this evening," said the sergeant firmly.

"Not this evening," pleaded Draper. "I'm feeling rather—this affair, you know, has upset me. I couldn't give proper attention—"

His sentence petered out into a hesitating mumble, and the officer looked at him in evident surprise at his nervous, embarrassed manner. His own attitude, however, was perfectly firm, though polite.

"I don't like pressing you, sir," said he, "but time is precious—we'll have to go single file here; this pond is a public nuisance. They ought to bank it up at this end. After you, sir."

The pond to which the sergeant alluded had evidently extended at one time right across the path, but now, thanks to the dry weather, a narrow isthmus of half-dried mud traversed the morass, and along this Mr. Draper proceeded to pick his way. The sergeant was about to follow, when suddenly he stopped short, with his eyes riveted upon the muddy track. A single glance showed me the cause of his surprise, for on the stiff, putty-like surface, standing out with the sharp distinctness of a wax mould, were the fresh footprints of the man who had just passed, each footprint displaying on its sole the impression of stud-nails arranged in a diamond-shaped pattern, and on its heel a group of similar nails arranged in a cross.

The sergeant hesitated for only a moment, in which he turned a quick startled glance upon us; then he followed, walking gingerly along the edge of the path as if to avoid treading in his predecessor's footprints. Instinctively we did the same, following closely, and anxiously awaiting the next development of the tragedy. For a minute or two we all proceeded in silence, the sergeant being evidently at a loss how to act, and Mr. Draper busy with his own thoughts. At length the former spoke.

"You think, Mr. Draper, you would rather that I looked in on you to-morrow about this affair?"

"Much rather, if you wouldn't mind," was the eager reply.

"Then, in that case," said the sergeant, looking at his watch, "as I've got a good deal to see to this evening, I'll leave you here, and make my way to the station."

With a farewell flourish of his hand he climbed over a stile, and when, a few moments later, I caught a glimpse of him through an opening in the hedge, he was running across the meadow like a hare.

The departure of the police-officer was apparently a great relief to Mr. Draper, who at once fell back and began to talk with us.

"You are Dr. Jervis, I think," said he. "I saw you coming out of Dr. Cooper's house yesterday. We know everything that is happening in the village, you see." He laughed nervously, and added: "But I don't know your friend."

I introduced Thorndyke, at the mention of whose name our new acquaintance knitted his brows, and glanced inquisitively at my friend.

"Thorndyke," he repeated; "the name seems familiar to me. Are you in the Law, sir?"

Thorndyke admitted the impeachment, and our companion, having again bestowed on him a look full of curiosity, continued: "This horrible affair will interest you, no doubt, from a professional point of view. You were present when my poor friend's body was found, I think?"

"No," replied Thorndyke; "we came up afterwards, when they were removing it."

Our companion then proceeded to question us about the murder, but received from Thorndyke only the most general and ambiguous replies. Nor was there time to go into the matter at length, for the footpath presently emerged on to the road close to Mr. Draper's house.

"You will excuse my not asking you in to-night," said he, "but you will understand that I am not in much form for visitors just now."

We assured him that we fully understood, and, having wished him "Good-evening," pursued our way towards the village.
“The sergeant is off to get a warrant, I suppose,” I observed.

“Yes; and mighty anxious lest his man should be off before he can execute it. But he is fishing in deeper waters than he thinks, Jervis. This is a very singular and complicated case; one of the strangest, in fact, that I have ever met. I shall follow its development with deep interest.”

“The sergeant seems pretty cocksure, all the same,” I said.

“He is not to blame for that,” replied Thorndyke. “He is acting on the obvious appearances, which is the proper thing to do in the first place. Perhaps his notebook contains more than I think it does. But we shall see.”

When we entered the village I stopped to settle some business with the chemist, who acted as Dr. Cooper’s dispenser, suggesting to Thorndyke that he should walk on to the house; but when I emerged from the shop some ten minutes later he was waiting outside, with a smallish brown-paper parcel under each arm. Of one of these parcels I insisted on relieving him, in spite of his protests, but when he at length handed it to me its weight completely took me by surprise.

“I should have let them send this home on a barrow,” I remarked.

“So I should have done,” he replied, “only I did not wish to draw attention to my purchase, or give my address.”

Accepting this hint I refrained from making any inquiries as to the nature of the contents (although I must confess to considerable curiosity on the subject), and on arriving home I assisted him to deposit the two mysterious parcels in his room.

When I came downstairs a disagreeable surprise awaited me. Hitherto the long evenings had been spent by me in solitary and undisturbed enjoyment of Dr. Cooper’s excellent library, but to-night a perversive fate decreed that I must wander abroad, because, forsooth, a preposterous farmer, who resided in a hamlet five miles distant, had chosen the evening of my guest’s arrival to dislocate his bucolic elbow. I half hoped that Thorndyke would offer to accompany me, but he made no such suggestion, and in fact seemed by no means afflicted at the prospect of my absence.

“I have plenty to occupy me while you are away,” he said cheerfully; and with this assurance to comfort me I mounted my bicycle and rode off somewhat sulkily along the dark road.

My visit occupied in all a trifle under two hours, and when I reached home, ravenously hungry and heated by my ride, half-past nine had struck, and the village had begun to settle down for the night.

“Sergeant Payne is a-waiting in the surgery, sir,” the housemaid announced as I entered the hall.

“Confound Sergeant Payne!” I exclaimed. “Is Dr. Thorndyke with him?”

“No, sir,” replied the grinning damsel. “Dr. Thorndyke is hout.”

“Hout!” I repeated (my surprise leading to unintentional mimicry).

“Yes, sir. He went hout soon after you, sir, on his bicycle. He had a basket strapped on to it—leastways a hamper—and he borrowed a basin and a kitchen-spoon from the cook.”

I stared at the girl in astonishment. The ways of John Thorndyke were, indeed, beyond all understanding.

“Well, let me have some dinner or supper at once,” I said, “and I will see what the sergeant wants.”

The officer rose as I entered the surgery, and, laying his helmet on the table, approached me with an air of secrecy and importance.

“Well, sir,” said he, “the fat’s in the fire. I’ve arrested Mr. Draper, and I’ve got him locked up in the court-house. But I wish it had been someone else.”

“So does he, I expect,” I remarked.

“You see, sir,” continued the sergeant, “we all like Mr. Draper. He’s been among us a matter of seven years, and he’s like one of ourselves. However, what I’ve come about is this; it seems the gentleman who was with you this evening is Dr. Thorndyke, the great expert. Now Mr. Draper seems to have heard about him, as most of us have, and he is very anxious for him to take up the defence. Do you think he would consent?”

“I expect so,” I answered, remembering Thorndyke’s keen interest in the case; “but I will ask him when he comes in.”

“Thank you, sir,” said the sergeant. “And perhaps you wouldn’t mind stepping round to the court-house presently yourself. He looks uncommon queer, does Mr. Draper, and no wonder, so I’d like you to take a look at him, and if you could bring Dr. Thorndyke with you, he’d like it, and so should I, for, I assure you, sir, that although a conviction would mean a step up the ladder for me, I’d be glad enough to find that I’d made a mistake.”

I was just showing my visitor out when a bicycle swept in through the open gate, and Thorndyke dismounted at the door, revealing a square hamper—evidently abstracted from the surgery—strapped on to a carrier at the back. I conveyed the sergeant’s request to him at once, and asked if he was willing to take up the case.

“As to taking up the defence,” he replied, “I will consider the matter; but in any case I will come up and see the prisoner.”

With this the sergeant departed, and Thorndyke, having unstrapped the hamper with as much care as if it contained a collection of priceless porcelain, bore it tenderly up to his bedroom; whence he appeared, after a considerable interval,
smilingly apologetic for the delay.

“...thought you were dressing for dinner,” I grumbled as he took his seat at the table.

“No,” he replied. “I have been considering this murder. Really it is a most singular case, and promises to be uncommonly complicated, too.”

“Then I assume that you will undertake the defence?”

“I shall if Draper gives a reasonably straightforward account of himself.”

It appeared that this condition was likely to be fulfilled, for when we arrived at the court-house (where the prisoner was accommodated in a spare office, under rather free-and-easy conditions considering the nature of the charge) we found Mr. Draper in an eminently communicative frame of mind.

“I want you, Dr. Thorndyke, to undertake my defence in this terrible affair, because I feel confident that you will be able to clear me. And I promise you that there shall be no reservation or concealment on my part of anything that you ought to know.”

“Very well,” said Thorndyke. “By the way, I see you have changed your shoes.”

“Yes, the sergeant took possession of those I was wearing. He said something about comparing them with some footprints, but there can’t be any footprints like those shoes here in Sundersley. The nails are fixed in the soles in quite a peculiar pattern. I had them made in Edinburgh.”

“Have you more than one pair?”

“No. I have no other nailed boots.”

“That is important,” said Thorndyke. “And now I judge that you have something to tell us that bears on this crime. Am I right?”

“Yes. There is something that I am afraid it is necessary for you to know, although it is very painful to me to revive memories of my past that I had hoped were buried for ever. But perhaps, after all, it may not be necessary for these confidences to be revealed to anyone but yourself.”

“I hope not,” said Thorndyke; “and if it is not necessary you may rely upon me not to allow any of your secrets to leak out. But you are wise to tell me everything that may in any way bear upon the case.”

At this juncture, seeing that confidential matters were about to be discussed, I rose and prepared to withdraw; but Draper waved me back into my chair.

“You need not go away, Dr. Jervis,” he said. “It is through you that I have the benefit of Dr. Thorndyke’s help, and I know that you doctors can be trusted to keep your own counsel and your clients’ secrets. And now for some confessions of mine. In the first place, it is my painful duty to tell you that I am a discharged convict—an ‘old lag,’ as the cant phrase has it.”

He coloured a dusky red as he made this statement, and glanced furtively at Thorndyke to observe its effect. But he might as well have looked at a wooden figure-head or a stone mask as at my friend’s immovable visage; and when his communication had been acknowledged by a slight nod, he proceeded:

“The history of my wrong-doing is the history of hundreds of others. I was a clerk in a bank, and getting on as well as I could expect in that not very progressive avocation, when I had the misfortune to make four very undesirable acquaintances. They were all young men, though rather older than myself, and were close friends, forming a sort of little community or club. They were not what is usually described as ‘fast.’ They were quite sober and decently-behaved young fellows, but they were very decidedly addicted to gambling in a small way, and they soon infected me. Before long I was the keenest gambler of them all. Cards, billiards, pool, and various forms of betting began to be the chief pleasures of my life, and not only was the bulk of my scanty salary often consumed in the inevitable losses, but presently I found myself considerably in debt, without any visible means of discharging my liabilities. It is true that my four friends were my chief—in fact, almost my only—creditors, but still, the debts existed, and had to be paid.

“Now these four friends of mine—named respectively Leach, Pitford, Hearn, and Jezzard—were uncommonly clever men, though the full extent of their cleverness was not appreciated by me until too late. And I, too, was clever in my way, and a most undesirable way it was, for I possessed the fatal gift of imitating handwriting and signatures with the most remarkable accuracy. So perfect were my copies that the writers themselves were frequently unable to distinguish their own signatures from my imitations, and many a time was my skill invoked by some of my companions to play off practical jokes upon the others. But these jests were strictly confined to our own little set, for my four friends were most careful and anxious that my dangerous accomplishment should not become known to outsiders.

“And now follows the consequence which you have no doubt foreseen. My debts, though small, were accumulating, and I saw no prospect of being able to pay them. Then, one night, Jezzard made a proposition. We had been playing bridge at his rooms, and once more my ill luck had caused me to increase my debt. I scribbled out an IOU, and pushed it across the table to Jezzard, who picked it up with a very wry face, and pocketed it.

“‘Look here, Ted,’ he said presently, ‘this paper is all very well, but, you know, I can’t pay my debts with it. My creditors demand hard cash.’
“I'm very sorry,” I replied, ‘but I can't help it.’

“Yes, you can,” said he, ‘and I'll tell you how.’ He then propounded a scheme which I at first rejected with indignation, but which, when the others backed him up, I at last allowed myself to be talked into, and actually put into execution. I contrived, by taking advantage of the carelessness of some of my superiors at the bank, to get possession of some blank cheque forms, which I filled up with small amounts—not more than two or three pounds—and signed with careful imitations of the signatures of some of our clients. Jezzard got some stamps made for stamping on the account numbers, and when this had been done I handed over to him the whole collection of forged cheques in settlement of my debts to all of my four companions.

“The cheques were duly presented—by whom I do not know; and although, to my dismay, the modest sums for which I had drawn them had been skilfully altered into quite considerable amounts, they were all paid without demur excepting one. That one, which had been altered from three pounds to thirty-nine, was drawn upon an account which was already slightly overdrawn. The cashier became suspicious; the cheque was impounded, and the client communicated with. Then, of course, the mine exploded. Not only was this particular forgery detected, but inquiries were set afoot which soon brought to light the others. Presently circumstances, which I need not describe, threw some suspicion on me. I at once lost my nerve, and finally made a full confession.

“The inevitable prosecution followed. It was not conducted vindictively. Still, I had actually committed the forgeries, and though I endeavoured to cast a part of the blame on to the shoulders of my treacherous confederates, I did not succeed. Jezzard, it is true, was arrested, but was discharged for lack of evidence, and, consequently, the whole burden of the forgery fell upon me. The jury, of course, convicted me, and I was sentenced to seven years' penal servitude.

“During the time that I was in prison an uncle of mine died in Canada, and by the provisions of his will I inherited the whole of his very considerable property, so that when the time arrived for my release, I came out of prison, not only free, but comparatively rich. I at once dropped my own name, and, assuming that of Alfred Draper, began to look about for some quiet spot in which I might spend the rest of my days in peace, and with little chance of my identity being discovered. Such a place I found in Sansersley, and here I have lived for the last seven years, liked and respected, I think, by my neighbours, who have little suspected that they were harbouring in their midst a convicted felon.

“All this time I had neither seen nor heard anything of my four confederates, and I hoped and believed that they had passed completely out of my life. But they had not. Only a month ago I met them once more, to my sorrow, and from the day of that meeting all the peace and security of my quiet existence at Sundersley have vanished. Like evil spirits they have stolen into my life, changing my happiness into bitter misery, filling my days with dark forebodings and my nights with terror.”

Here Mr. Draper paused, and seemed to sink into a gloomy reverie.

“Under what circumstances did you meet these men?” Thorndyke asked.

“Ah!” exclaimed Draper, arousing with sudden excitement, “the circumstances were very singular and suspicious. I had gone over to Eastwich for the day to do some shopping. About eleven o'clock in the forenoon I was making some purchases in a shop when I noticed two men looking in the window, or rather pretending to do so, whilst they conversed earnestly. They were smartly dressed, in a horsy fashion, and looked like well-to-do farmers, as they might very naturally have been since it was market-day. But it seemed to me that their faces were familiar to me. I looked at them more attentively, and then it suddenly dawned upon me, most unpleasantly, that they resembled Leach and Jezzard. And yet they were not quite like. The resemblance was there, but the differences were greater than the lapse of time would account for. Moreover, the man who resembled Jezzard had a rather large mole on the left cheek just under the eye, while the other man had an eyeglass stuck in one eye, while Leach had always been clean-shaven, and had never used an eyeglass.

“As I was speculating upon the resemblance they looked up, and caught my intent and inquisitive eye, whereupon they moved away from the window; and when, having completed my purchases, I came out into the street, they were nowhere to be seen.

“That evening, as I was walking by the river outside the town before returning to the station, I overtook a yacht which was being towed down-stream. Three men were walking ahead on the bank with a long tow-line, and one man stood in the cockpit steering. As I approached, and was reading the name Otter on the stern, the man at the helm looked round, and with a start of surprise I recognized my old acquaintance Hearn. The recognition, however, was not mutual, for I had grown a beard in the interval, and I passed on without appearing to notice him; but when I overtook the other three men, and recognized, as I had feared, the other three members of the gang, I must have looked rather hard at Jezzard, for he suddenly halted, and exclaimed: ‘Why, it's our old friend Ted! Our long-lost and lamented brother!’ He held out his hand with effusive cordiality, and began to make inquiries as to my welfare; but I cut him short with the remark that I was not proposing to renew the acquaintance, and, turning off on to a footpath that led away from the river, strode off without looking back.

“Naturally this meeting exercised my mind a good deal, and when I thought of the two men whom I had seen in the town, I could hardly believe that their likeness to my quondam friends was a mere coincidence. And yet when I had met Leach and Jezzard by the river, I had found them little altered, and had particularly noticed that Jezzard had no mole on his face, and that Leach was clean-shaven as of old.
“But a day or two later all my doubts were resolved by a paragraph in the local paper. It appeared that on the day of my visit to Eastwich a number of forged cheques had been cashed at the three banks. They had been presented by three well-dressed, horsy-looking men who looked like well-to-do farmers. One of them had a mole on the left cheek, another was distinguished by a waxed moustache and a single eyeglass, while the description of the third I did not recognize. None of the cheques had been drawn for large amounts, though the total sum obtained by the forgers was nearly four hundred pounds; but the most interesting point was that the cheque-forms had been manufactured by photographic process, and the water-mark skilfully, though not quite perfectly, imitated. Evidently the swindlers were clever and careful men, and willing to take a good deal of trouble for the sake of security, and the result of their precautions was that the police could make no guess as to their identity.

“The very next day, happening to walk over to Port Marston, I came upon the Otter lying moored alongside the quay in the harbour. As soon as I recognized the yacht, I turned quickly and walked away, but a minute later I ran into Leach and Jezzard, who were returning to their craft. Jezzard greeted me with an air of surprise. ‘What! Still hanging about here, Ted?’ he exclaimed. ‘That is not discreet of you, dear boy. I should earnestly advise you to clear out.’

“‘What do you mean?’ I asked.

“‘Tut, tut!’ said he. ‘We read the papers like other people, and we know now what business took you to Eastwich. But it’s foolish of you to hang about the neighbourhood where you might be spotted at any moment.’

“The implied accusation took me aback so completely that I stood staring at him in speechless astonishment, and at that unlucky moment a tradesman, from whom I had ordered some house-linen, passed along the quay. Seeing me, he stopped and touched his hat.

“‘Beg pardon, Mr. Draper,’ said he, ‘but I shall be sending my cart up to Sundersley to-morrow morning if that will do for you.’

“I said that it would, and as the man turned away, Jezzard’s face broke out into a cunning smile.

“‘So you are Mr. Draper, of Sundersley, now, are you?’ said he. ‘Well, I hope you won’t be too proud to come and look in on your old friends. We shall be staying here for some time.’

“That same night Hearn made his appearance at my house. He had come as an emissary from the gang, to ask me to do some work for them—to execute some forgeries, in fact. Of course I refused, and pretty bluntly, too, whereupon Hearn began to throw out vague hints as to what might happen if I made enemies of the gang, and to utter veiled threats. You will say that I was an idiot not to send him packing, and threaten to hand over the whole gang to the police; but I was never a man of strong nerve, and I don’t mind admitting that I was mortally afraid of that cunning devil, Jezzard.

“The next thing that happened was that Hearn came and took lodgings in Sundersley, and, in spite of my efforts to avoid him, he haunted me continually. The yacht, too, had evidently settled down for some time at a berth in the harbour, for I heard that a local smack-boy had been engaged as a deck-hand; and I frequently encountered Jezzard and the other members of the gang, who all professed to believe that I had committed the Eastwich forgeries. One day I was foolish enough to allow myself to be lured on to the yacht for a few minutes, and when I would have gone ashore, I found that the shore ropes had been cast off, and that the vessel was already moving out of the harbour. At first I was furious, but the three scoundrels were so jovial and good-natured, and so delighted with the joke of taking me for a sail against my will, that I presently cooled down, and having changed into a pair of rubber-soled shoes (so that I should not make dents in the smooth deck with my hobnails), bore a hand at sailing the yacht, and spent quite a pleasant day.

“From that time I found myself gradually drifting back into a state of intimacy with these agreeable scoundrels, and daily becoming more and more afraid of them. In a moment of imbecility I mentioned what I had seen from the shop-window at Eastwich, and, though they passed the matter off with a joke, I could see that they were mightily disturbed by it. Their efforts to induce me to join them were redoubled, and Hearn took to calling almost daily at my house—usually with documents and signatures which he tried to persuade me to copy.

“A few evenings ago he made a new and startling proposition. We were walking in my garden, and he had been urging me once more to rejoin the gang—unsuccessfully, I need not say. Presently he sat down on a seat against a yew-hedge at the bottom of the garden, and, after an interval of silence, said suddenly:

“‘Then you absolutely refuse to go in with us?’

“‘Of course I do,’ I replied. ‘Why should I mix myself up with a gang of crooks when I have ample means and a decent position?’

“‘Of course,’ he agreed, ‘you’d be a fool if you did. But, you see, you know all about this Eastwich job, to say nothing of our other little exploits, and you gave us away once before. Consequently, you can take it from me that, now Jezzard has run you to earth, he won’t leave you in peace until you have given us some kind of a hold on you. You know too much, you see, and as long as you have a clean sheet you are a standing menace to us. That is the position. You know it, and Jezzard knows it, and he is a desperate man, and as cunning as the devil.’

“‘I know that,’ I said gloomily.

“‘Very well,’ continued Hearn. ‘Now I’m going to make you an offer. Promise me a small annuity—you can easily afford it
—or pay me a substantial sum down, and I will set you free for ever from Jezzard and the others.'

"How will you do that?" I asked.

"Very simply," he replied. 'I am sick of them all, and sick of this risky, uncertain mode of life. Now I am ready to clean off my own slate and set you free at the same time; but I must have some means of livelihood in view."

"You mean that you will turn King's evidence?" I asked.

"Yes, if you will pay me a couple of hundred a year, or, say, two thousand down on the conviction of the gang."

"I was so taken aback that for some time I made no reply, and as I sat considering this amazing proposition, the silence was suddenly broken by a suppressed sneeze from the other side of the hedge.

"Hearn and I started to our feet. Immediately hurried footsteps were heard in the lane outside the hedge. We raced up the garden to the gate and out through a side alley, but when we reached the lane there was not a soul in sight. We made a brief and fruitless search in the immediate neighbourhood, and then turned back to the house. Hearn was deathly pale and very agitated, and I must confess that I was a good deal upset by the incident.

"This is devilish awkward," said Hearn.

"It is rather," I admitted; 'but I expect it was only some inquisitive yokel.'

"I don't feel so sure of that," said he. 'At any rate, we were stark lunatics to sit up against a hedge to talk secrets.'

"He paced the garden with me for some time in gloomy silence, and presently, after a brief request that I would think over his proposal, took himself off.

"I did not see him again until I met him last night on the yacht. Pitford called on me in the morning, and invited me to come and dine with them. I at first declined, for my housekeeper was going to spend the evening with her sister at Eastwich, and stay there for the night, and I did not much like leaving the house empty. However, I agreed eventually, stipulating that I should be allowed to come home early, and I accordingly went. Hearn and Pitford were waiting in the boat by the steps—for the yacht had been moved out to a buoy—and we went on board and spent a very pleasant and lively evening. Pitford put me ashore at ten o'clock, and I walked straight home, and went to bed. Hearn would have come with me, but the others insisted on his remaining, saying that they had some matters of business to discuss."

"Which way did you walk home?" asked Thorndyke.

"I came through the town, and along the main road."

"And that is all you know about this affair?"

"Absolutely all," replied Draper. 'I have now admitted you to secrets of my past life that I had hoped never to have to reveal to any human creature, and I still have some faint hope that it may not be necessary for you to divulge what I have told you."

"Your secrets shall not be revealed unless it is absolutely indispensable that they should be," said Thorndyke; "but you are placing your life in my hands, and you must leave me perfectly free to act as I think best."

With this he gathered his notes together, and we took our departure.

"A very singular history, this, Jervis," he said, when, having wished the sergeant "Good-night," we stepped out on to the dark road. "What do you think of it?"

"I hardly know what to think," I answered, "but, on the whole, it seems rather against Draper than otherwise. He admits that he is an old criminal, and it appears that he was being persecuted and blackmailed by the man Hearn. It is true that he represents Jezzard as being the leading spirit and prime mover in the persecution, but we have only his word for that. Hearn was in lodgings near him, and was undoubtedly taking the most active part in the business, and it is quite possible, and indeed probable, that Hearn was the actual deus ex machina."

Thorndyke nodded. "Yes," he said, "that is certainly the line the prosecution will take if we allow the story to become known. Ha! what is this? We are going to have some rain."

"Yes, and wind too. We are in for an autumn gale, I think."

"And that," said Thorndyke, "may turn out to be an important factor in our case."

"How can the weather affect your case?" I asked in some surprise. But, as the rain suddenly descended in a pelting shower, my companion broke into a run, leaving my question unanswered.

On the following morning, which was fair and sunny after the stormy night, Dr. Burrows called for my friend. He was on his way to the extemporized mortuary to make the post-mortem examination of the murdered man's body. Thorndyke, having notified the coroner that he was watching the case on behalf of the accused, had been authorized to be present at the autopsy; but the authorization did not include me, and, as Dr. Burrows did not issue any invitation, I was not able to be present. I met them, however, as they were returning, and it seemed to me that Dr. Burrows appeared a little huffy.

"Your friend," said he, in a rather injured tone, "is really the most outrageous stickler for forms and ceremonies that I have ever met."
Thorndyke looked at him with an amused twinkle, and chuckled indulgently.

"Here was a body," Dr. Burrows continued irritably, "found under circumstances clearly indicative of murder, and bearing a knife-wound that nearly divided the arch of the aorta; in spite of which, I assure you that Dr. Thorndyke insisted on weighing the body, and examining every organ—lungs, liver, stomach, and brain—yes, actually the brain!—as if there had been no clue whatever to the cause of death. And then, as a climax, he insisted on sending the contents of the stomach in a jar, sealed with our respective seals, in charge of a special messenger, to Professor Copland, for analysis and report. I thought he was going to demand an examination for the tubercle bacillus, but he didn't; which," concluded Dr. Burrows, suddenly becoming sourly facetious, "was an oversight, for, after all, the fellow may have died of consumption."

Thorndyke chuckled again, and I murmured that the precautions appeared to have been somewhat excessive.

"Not at all," was the smiling response. "You are losing sight of our function. We are the expert and impartial umpires, and it is our business to ascertain, with scientific accuracy, the cause of death. The prima facie appearances in this case suggest that the deceased was murdered by Draper, and that is the hypothesis advanced. But that is no concern of ours. It is not our function to confirm an hypothesis suggested by outside circumstances, but rather, on the contrary, to make certain that no other explanation is possible. And that is my invariable practice. No matter how glaringly obvious the appearances may be, I refuse to take anything for granted."

Dr. Burrows received this statement with a grunt of dissent, but the arrival of his dogcart put a stop to further discussion.

Thorndyke was not subpoenaed for the inquest. Dr. Burrows and the sergeant having been present immediately after the finding of the body, his evidence was not considered necessary, and, moreover, he was known to be watching the case in the interests of the accused. Like myself, therefore, he was present as a spectator, but as a highly interested one, for he took very complete shorthand notes of the whole of the evidence and the coroner's comments.

I shall not describe the proceedings in detail. The jury, having been taken to view the body, trooped into the room on tiptoe, looking pale and awe-stricken, and took their seats; and thereafter, from time to time, directed glances of furtive curiosity at Draper as he stood, pallid and haggard, confronting the court, with a burly rural constable on either side.

The medical evidence was taken first. Dr. Burrows, having been sworn, began, with sarcastic emphasis, to describe the condition of the lungs and liver, until he was interrupted by the coroner.

"Is all this necessary?" the latter inquired. "I mean, is it material to the subject of the inquiry?"

"I should say not," replied Dr. Burrows. "It appears to me to be quite irrelevant, but Dr. Thorndyke, who is watching the case for the defence, thought it necessary."

"I think," said the coroner, "you had better give us only the facts that are material. The jury want you to tell them what you consider to have been the cause of death. They don't want a lecture on pathology."

"The cause of death," said Dr. Burrows, "was a penetrating wound of the chest, apparently inflicted with a large knife. The weapon entered between the second and third ribs on the left side close to the sternum or breast-bone. It wounded the left lung, and partially divided both the pulmonary artery and the aorta—the two principal arteries of the body."

"Was this injury alone sufficient to cause death?" the coroner asked.

"Yes," was the reply; "and death from injury to these great vessels would be practically instantaneous."

"Could the injury have been self-inflicted?"

"So far as the position and nature of the wound are concerned," replied the witness, "self-infliction would be quite possible. But since death would follow in a few seconds at the most, the weapon would be found either in the wound, or graspèd in the hand, or, at least, quite close to the body. But in this case no weapon was found at all, and the wound must therefore certainly have been homicidal."

"Did you see the body before it was moved?"

"Yes. It was lying on its back, with the arms extended and the legs nearly straight; and the sand in the neighbourhood of the body was trampled as if a furious struggle had taken place."

"Did you notice anything remarkable about the footprints in the sand?"

"I did," replied Dr. Burrows. "They were the footprints of two persons only. One of these was evidently the deceased, whose footmarks could be easily identified by the circular rubber heels. The other footprints were those of a person—apparently a man—who wore shoes, or boots, the soles of which were studded with nails; and these nails were arranged in a very peculiar and unusual manner, for those on the soles formed a lozenge or diamond shape, and those on the heel were set out in the form of a cross."

"Have you ever seen shoes or boots with the nails arranged in this manner?"

"Yes. I have seen a pair of shoes which I am informed belong to the accused; the nails in them are arranged as I have described."

"Would you say that the footprints of which you have spoken were made by those shoes?"
“No; I could not say that. I can only say that, to the best of my belief, the pattern on the shoes is similar to that in the footprints.”

This was the sum of Dr. Burrows’ evidence, and to all of it Thorndyke listened with an immovable countenance, though with the closest attention. Equally attentive was the accused man, though not equally impassive; indeed, so great was his agitation that presently one of the constables asked permission to get him a chair.

The next witness was Arthur Jezzard. He testified that he had viewed the body, and identified it as that of Charles Hearn; that he had been acquainted with deceased for some years, but knew practically nothing of his affairs. At the time of his death deceased was lodging in the village.

“Why did he leave the yacht?” the coroner inquired. “Was there any kind of disagreement?”

“Not in the least,” replied Jezzard. “He grew tired of the confinement of the yacht, and came to live ashore for a change. But we were the best of friends, and he intended to come with us when we sailed.”

“When did you see him last?”

“On the night before the body was found—that is, last Monday. He had been dining on the yacht, and we put him ashore about midnight. He said as we were rowing him ashore that he intended to walk home along the sands as the tide was out. He went up the stone steps by the watch-house, and turned at the top to wish us good-night. That was the last time I saw him alive.”

“Do you know anything of the relations between the accused and the deceased?” the coroner asked.

“Very little,” replied Jezzard. “Mr. Draper was introduced to us by the deceased about a month ago. I believe they had been acquainted some years, and they appeared to be on excellent terms. There was no indication of any quarrel or disagreement between them.”

“What time did the accused leave the yacht on the night of the murder?”

“About ten o’clock. He said that he wanted to get home early, as his housekeeper was away and he did not like the house to be left with no one in it.”

This was the whole of Jezzard’s evidence, and was confirmed by that of Leach and Pitford. Then, when the fisherman had deposed to the discovery of the body, the sergeant was called, and stepped forward, grasping a carpet-bag, and looking as uncomfortable as if he had been the accused instead of a witness. He described the circumstances under which he saw the body, giving the exact time and place with official precision.

“You have heard Dr. Burrows’ description of the footprints?” the coroner inquired.

“Yes. There were two sets. One set were evidently made by deceased. They showed that he entered St. Bridget’s Bay from the direction of Port Marston. He had been walking along the shore just about high-water mark, sometimes above and sometimes below. Where he had walked below high-water mark the footprints had of course been washed away by the sea.”

“How far back did you trace the footprints of deceased?”

“About two-thirds of the way to Sundersley Gap. Then they disappeared below high-water mark. Later in the evening I walked from the Gap into Port Marston, but could not find any further traces of deceased. He must have walked between the tide-marks all the way from Port Marston to beyond Sundersley. When these footprints entered St. Bridget’s Bay they became mixed up with the footprints of another man, and the shore was trampled for a space of a dozen yards as if a furious struggle had taken place. The strange man’s tracks came down from the Shepherd’s Path, and went up it again; but, owing to the hardness of the ground from the dry weather, the tracks disappeared a short distance up the path, and I could not find them again.”

“What were these strange footprints like?” inquired the coroner.

“They were very peculiar,” replied the sergeant. “They were made by shoes armed with smallish hob-nails, which were arranged in a diamond-shaped pattern on the holes and in a cross on the heels. I measured the footprints carefully, and made a drawing of each foot at the time.” Here the sergeant produced a long notebook of funereal aspect, and, having opened it at a marked place, handed it to the coroner, who examined it attentively, and then passed it on to the jury. From the jury it was presently transferred to Thorndyke, and, looking over his shoulder, I saw a very workmanlike sketch of a pair of footprints with the principal dimensions inserted.

Thorndyke surveyed the drawing critically, jotted down a few brief notes, and returned the sergeant’s notebook to the coroner, who, as he took it, turned once more to the officer.

“Have you any clue, sergeant, to the person who made these footprints?” he asked.

By way of reply the sergeant opened his carpet-bag, and, extracting therefrom a pair of smart but stoutly made shoes, laid them on the table.

“Those shoes,” he said, “are the property of the accused; he was wearing them when I arrested him. They appear to correspond exactly to the footprints of the murderer. The measurements are the same, and the nails with which they are studded are arranged in a similar pattern.”
"Would you swear that the footprints were made with these shoes?" asked the coroner.

"No, sir, I would not," was the decided answer. "I would only swear to the similarity of size and pattern."

"Had you ever seen these shoes before you made the drawing?"

"No, sir," replied the sergeant; and he then related the incident of the footprints in the soft earth by the pond which led him to make the arrest.

The coroner gazed reflectively at the shoes which he held in his hand, and from them to the drawing; then, passing them to the foreman of the jury, he remarked:

"Well, gentlemen, it is not for me to tell you whether these shoes answer to the description given by Dr. Burrows and the sergeant, or whether they resemble the drawing which, as you have heard, was made by the officer on the spot and before he had seen the shoes; that is a matter for you to decide. Meanwhile, there is another question that we must consider." He turned to the sergeant and asked: "Have you made any inquiries as to the movements of the accused on the night of the murder?"

"I have," replied the sergeant, "and I find that, on that night, the accused was alone in the house, his housekeeper having gone over to Eastwich. Two men saw him in the town about ten o'clock, apparently walking in the direction of Sundersley."

This concluded the sergeant's evidence, and when one or two more witnesses had been examined without eliciting any fresh facts, the coroner briefly recapitulated the evidence, and requested the jury to consider their verdict. Thereupon a solemn hush fell upon the court, broken only by the whispers of the jurymen, as they consulted together; and the spectators gazed in awe of expectancy from the accused to the whispering jury. I glanced at Draper, sitting huddled in his chair, his clammy face as pale as that of the corpse in the mortuary hard by, his hands tremulous and restless; and, scoundrel as I believed him to be, I could not but pity the abject misery that was written large all over him, from his damp hair to his incessantly shifting feet.

The jury took but a short time to consider their verdict. At the end of five minutes the foreman announced that they were agreed, and, in answer to the coroner's formal inquiry, stood up and replied:

"We find that the deceased met his death by being stabbed in the chest by the accused man, Alfred Draper."

"That is a verdict of wilful murder," said the coroner, and he entered it accordingly in his notes. The Court now rose. The spectators reluctantly trooped out, the jurymen stood up and stretched themselves, and the two constables, under the guidance of the sergeant, carried the wretched Draper in a fainting condition to a closed fly that was waiting outside.
“I was not greatly impressed by the activity of the defence,” I remarked maliciously as we walked home.

Thorndyke smiled. “You surely did not expect me to cast my pearls of forensic learning before a coroner’s jury,” said he.

“I expected that you would have something to say on behalf of your client,” I replied. “As it was, his accusers had it all their own way.”

“And why not?” he asked. “Of what concern to us is the verdict of the coroner’s jury?”

“It would have seemed more decent to make some sort of defence,” I replied.

“My dear Jervis,” he rejoined, “you do not seem to appreciate the great virtue of what Lord Beaconsfield so felicitously called a policy of masterly inactivity; and yet that is one of the great lessons that a medical training impresses on the student.”

“That may be so,” said I. “But the result, up to the present, of your masterly policy is that a verdict of wilful murder stands against your client, and I don’t see what other verdict the jury could have found.”

“Neither do I,” said Thorndyke.

I had written to my principal, Dr. Cooper, describing the stirring events that were taking place in the village, and had received a reply from him instructing me to place the house at Thorndyke’s disposal, and to give him every facility for his work. In accordance with which edict my colleague took possession of a well-lighted, disused stable-loft, and announced his intention of moving his things into it. Now, as these “things” included the mysterious contents of the hamper that the housemaid had seen, I was possessed with a consuming desire to be present at the “flitting,” and I do not mind confessing that I purposely lurked about the stairs in the hopes of thus picking up a few crumbs of information.

But Thorndyke was one too many for me. A misbegotten infant in the village having been seized with inopportune convulsions, I was compelled, most reluctantly, to hasten to its relief; and I returned only in time to find Thorndyke in the act of locking the door of the loft.

“A nice light, roomy place to work in,” he remarked, as he descended the steps, slipping the key into his pocket.

“Yes,” I replied, and added boldly: “What do you intend to do up there?”

“Work up the case for the defence,” he replied, “and, as I have now heard all that the prosecution have to say, I shall be able to forge ahead.”

This was vague enough, but I consoled myself with the reflection that in a very few days I should, in common with the rest of the world, be in possession of the results of his mysterious proceedings. For, in view of the approaching assizes, preparations were being made to push the case through the magistrate’s court as quickly as possible in order to obtain a committal in time for the ensuing sessions. Draper had, of course, been already charged before a justice of the peace and evidence of arrest taken, and it was expected that the adjourned hearing would commence before the local magistrates on the fifth day after the inquest.

The events of these five days kept me in a positive ferment of curiosity. In the first place an inspector of the Criminal Investigation Department came down and browsed about the place in company with the sergeant. Then Mr. Bashfield, who was to conduct the prosecution, came and took up his abode at the “Cat and Chicken.” But the most surprising visitor was Thorndyke’s laboratory assistant, Polton, who appeared one evening with a large trunk and a sailor’s hammock, and announced that he was going to take up his quarters in the loft.

As to Thorndyke himself, his proceedings were beyond speculation. From time to time he made mysterious appearances at the windows of the loft, usually arrayed in what looked suspiciously like a nightshirt. Sometimes I would see him holding a negative up to the light, at others manipulating a photographic printing-frame; and once I observed him with a paintbrush and a large gallipot; on which I turned away in despair, and nearly collided with the inspector.

“Dr. Thorndyke is staying with you, I hear,” said the latter, gazing earnestly at my colleague’s back, which was presented for his inspection at the window.

“Yes,” I answered. “Those are his temporary premises.”

“That is where he does his bedevilments, I suppose?” the officer suggested.

“He conducts his experiments there,” I corrected haughtily.

“That’s what I mean,” said the inspector; and, as Thorndyke at this moment turned and opened the window, our visitor began to ascend the steps.

“I’ve just called to ask if I could have a few words with you, Doctor,” said the inspector, as he reached the door.

“Certainly,” Thorndyke replied blandly. “If you will go down and wait with Dr. Jervis, I will be with you in five minutes.”

The officer came down the steps grinning, and I thought I heard him murmur “Sold!” But this may have been an illusion. However, Thorndyke presently emerged, and he and the officer strode away into the shrubbery. What the inspector’s business was, or whether he had any business at all, I never learned; but the incident seemed to throw some light on the presence of Polton and the sailor’s hammock. And this reference to Polton reminds me of a very singular change that took place about this time in the habits of this usually staid and sedate little man; who, abandoning the somewhat clerical style
of dress that he ordinarily affected, broke out into a semi-nautical costume, in which he would sally forth every morning in the direction of Port Marston. And there, on more than one occasion, I saw him leaning against a post by the harbour, or lounging outside a waterside tavern in earnest and amicable conversation with sundry nautical characters.

On the afternoon of the day before the opening of the proceedings we had two new visitors. One of them, a grey-haired spectated man, was a stranger to me, and for some reason I failed to recall his name, Copland, though I was sure I had heard it before. The other was Anstey, the barrister who usually worked with Thorndyke in cases that went into Court. I saw very little of either of them, however, for they retired almost immediately to the loft, where, with short intervals for meals, they remained for the rest of the day, and, I believe, far into the night. Thorndyke requested me not to mention the names of his visitors to anyone, and at the same time apologized for the secrecy of his proceedings.

“But you are a doctor, Jervis,” he concluded, “and you know what professional confidences are; and you will understand how greatly it is in our favour that we know exactly what the prosecution can do, while they are absolutely in the dark as to our line of defence.”

I assured him that I fully understood his position, and with this assurance he retired, evidently relieved, to the council chamber.

The proceedings, which opened on the following day, and at which I was present throughout, need not be described in detail. The evidence for the prosecution was, of course, mainly a repetition of that given at the inquest. Mr. Bashfield’s opening statement, however, I shall give at length, inasmuch as it summarized very clearly the whole of the case against the prisoner.

“The case that is now before the Court,” said the counsel, “involves a charge of wilful murder against the prisoner Alfred Draper, and the facts, in so far as they are known, are briefly these: On the night of Monday, the 27th of September, the deceased, Charles Hearn, dined with some friends on board the yacht Otter. About midnight he came ashore, and proceeded to walk towards Sunderley along the beach. As he entered St. Bridget’s Bay, a man, who appears to have been lying in wait, and who came down the Shepherd’s Path, met him, and a deadly struggle seems to have taken place. The deceased received a wound of a kind calculated to cause almost instantaneous death, and apparently fell down dead.

“And now, what was the motive of this terrible crime? It was not robbery, for nothing appears to have been taken from the corpse. Money and valuables were found, as far as is known, intact. Nor, clearly, was it a case of a casual affray. We are, consequently, driven to the conclusion that the motive was a personal one, a motive of interest or revenge, and with this view the time, the place, and the evident deliberateness of the murder are in full agreement.

“So much for the motive. The next question is, Who was the perpetrator of this shocking crime? And the answer to that question is given in a very singular and dramatic circumstance, a circumstance that illustrates once more the amazing lack of precaution shown by persons who commit such crimes. The murderer was wearing a very remarkable pair of shoes, and those shoes left very remarkable footprints in the smooth sand, and those footprints were seen and examined by a very acute and painstaking police-officer, Sergeant Payne, whose evidence you will hear presently. The sergeant not only examined the footprints, he made careful drawings of them on the spot—on the spot, mind you, not from memory—and he made very exact measurements of them, which he duly noted down. And from those drawings and those measurements, those tell-tale shoes have been identified, and are here for your inspection.

“And now, who is the owner of those very singular, those almost unique shoes? I have said that the motive of this murder must have been a personal one, and, behold! the owner of those shoes happens to be the one person in the whole of this district who could have had a motive for compassing the murdered man’s death. Those shoes belong to, and were taken from the foot of, the prisoner, Alfred Draper, and the prisoner, Alfred Draper, is the only person living in this neighbourhood who was acquainted with the deceased.

“It has been stated in evidence at the inquest that the relations of these two men, the prisoner and the deceased, were entirely friendly; but I shall prove to you that they were not so friendly as has been supposed. I shall prove to you, by the evidence of the prisoner’s housekeeper, that the deceased was often an unwelcome visitor at the house, that the prisoner often denied himself when he was really at home and disengaged, and, in short, that he appeared constantly to shun and avoid the deceased.

“One more question and I have finished. Where was the prisoner on the night of the murder? The answer is that he was in a house little more than half a mile from the scene of the crime. And who was with him in that house? Who was there to observe and testify to his going forth and his coming home? No one. He was alone in the house. On that night, of all nights, he was alone. Not a soul was there to rouse at the crack of a door or the tread of a shoe—to tell as whether he slept or whether he stole forth in the dead of the night.

“Such are the facts of this case. I believe that they are not disputed, and I assert that, taken together, they are susceptible of only one explanation, which is that the prisoner, Alfred Draper, is the man who murdered the deceased, Charles Hearn.”

Immediately on the conclusion of this address, the witnesses were called, and the evidence given was identical with that at the inquest. The only new witness for the prosecution was Draper’s housekeeper, and her evidence fully bore out Mr. Bashfield’s statement. The sergeant’s account of the footprints was listened to with breathless interest, and at its conclusion the presiding magistrate—a retired solicitor, once well known in criminal practice—put a question which interested me as showing how clearly Thorndyke had foreseen the course of events, recalling, as it did, his remark on the night when we were caught in the rain.
“Did you,” the magistrate asked, “take these shoes down to the beach and compare them with the actual footprints?”

“I obtained the shoes at night,” replied the sergeant, “and I took them down to the shore at daybreak the next morning. But, unfortunately, there had been a storm in the night, and the footprints were almost obliterated by the wind and rain.”

When the sergeant had stepped down, Mr. Bashfield announced that that was the case for the prosecution. He then resumed his seat, turning an inquisitive eye on Anstey and Thorndyke.

The former immediately rose and opened the case for the defence with a brief statement.

“The learned counsel for the prosecution,” said he, “has told us that the facts now in the possession of the Court admit of but one explanation—that of the guilt of the accused. That may or may not be; but I shall now proceed to lay before the Court certain fresh facts—facts, I may say, of the most singular and startling character, which will, I think, lead to a very different conclusion. I shall say no more, but call the witnesses forthwith, and let the evidence speak for itself.”

The first witness for the defence was Thorndyke; and as he entered the box I observed Polton take up a position close behind him with a large wicker trunk. Having been sworn, and requested by Anstey to tell the Court what he knew about the case, he commenced without preamble:

“About half-past four in the afternoon of the 28th of September I walked down Sundersley Gap with Dr. Jervis. Our attention was attracted by certain footprints in the sand, particularly those of a man who had landed from a boat, had walked up the Gap, and presently returned, apparently to the boat.

“As we were standing there Sergeant Payne and Dr. Burrows passed down the Gap with two constables carrying a stretcher. We followed at a distance, and as we walked along the shore we encountered another set of footprints—those which the sergeant has described as the footprints of the deceased. We examined these carefully, and endeavoured to frame a description of the person by whom they had been made.”

“And did your description agree with the characters of the deceased?” the magistrate asked.

“Not in the least,” replied Thorndyke, whereupon the magistrate, the inspector, and Mr. Bashfield laughed long and heartily.

“When we turned into St. Bridget’s Bay, I saw the body of deceased lying on the sand close to the cliff. The sand all round was covered with footprints, as if a prolonged, fierce struggle had taken place. There were two sets of footprints, one set being apparently those of the deceased and the other those of a man with nailed shoes of a very peculiar and conspicuous pattern. The incredible folly that the wearing of such shoes indicated caused me to look more closely at the footprints, and then I made the surprising discovery that there had in reality been no struggle; that, in fact, the two sets of footprints had been made at different times.”

“At different times!” the magistrate exclaimed in astonishment.

“Yes. The interval between them may have been one of hours or one only of seconds, but the undoubted fact is that the two sets of footprints were made, not simultaneously, but in succession.”

“But how did you arrive at that fact?” the magistrate asked.

“It was very obvious when one looked,” said Thorndyke. “The marks of the deceased man’s shoes showed that he repeatedly trod in his own footprints; but never in a single instance did he tread in the footprints of the other man, although they covered the same area. The man with the nailed shoes, on the contrary, not only trod in his own footprints, but with equal frequency in those of the deceased. Moreover, when the body was removed, I observed that the footprints in the sand on which it was lying were exclusively those of the deceased. There was not a sign of any nail-marked footprint under the corpse, although there were many close around it. It was evident, therefore, that the footprints of the deceased were made first and those of the nailed shoes afterwards.”

As Thorndyke paused the magistrate rubbed his nose thoughtfully, and the inspector gazed at the witness with a puzzled frown.

“The singularity of this fact,” my colleague resumed, “made me look at the footprints yet more critically, and then I made another discovery. There was a double track of the nailed shoes, leading apparently from and back to the Shepherd’s Path. But on examining these tracks more closely, I was astonished to find that the man who had made them had been walking backwards; that, in fact, he had walked backwards from the body to the Shepherd’s Path, had ascended it for a short distance, had turned round, and returned, still walking backwards, to the face of the cliff near the corpse, and there the tracks vanished altogether. On the sand at this spot were some small, inconspicuous marks which might have been made by the end of a rope, and there were also a few small fragments which had fallen from the cliff above. Observing these, I examined the surface of the cliff, and at one spot, about six feet above the beach, I found a freshly rubbed spot on which were parallel scratches such as might have been made by the nailed sole of a boot. I then ascended the Shepherd’s Path, and examined the cliff from above, and here I found on the extreme edge a rather deep indentation, such as would be made by a taut rope, and, on lying down and looking over, I could see, some five feet from the top, another rubbed spot with very distinct parallel scratches.”

“You appear to infer,” said the chairman, “that this man performed these astonishing evolutions and was then hauled up the cliff?”
“That is what the appearances suggested,” replied Thorndyke.

The chairman pursed up his lips, raised his eyebrows, and glanced doubtfully at his brother magistrates. Then, with a resigned air, he bowed to the witness to indicate that he was listening.

“That same night,” Thorndyke resumed, “I cycled down to the shore, through the Gap, with a supply of plaster of Paris, and proceeded to take plaster moulds of the more important of the footprints.” (Here the magistrates, the inspector, and Mr. Bashfield with one accord sat up at attention; Sergeant Payne swore quite audibly; and I experienced a sudden illumination respecting a certain basin and kitchen spoon which had so puzzled me on the night of Thorndyke’s arrival.) “As I thought that liquid plaster might confuse or even obliterate the prints in sand, I filled up the respective footprints with dry plaster, pressed it down lightly, and then cautiously poured water on to it. The moulds, which are excellent impressions, of course show the appearance of the boots which made the footprints, and from these moulds I have prepared casts which reproduce the footprints themselves.

“The first mould that I made was that of one of the tracks from the boat up to the Gap, and of this I shall speak presently. I next made a mould of one of the footprints which have been described as those of the deceased.”

“Have been described!” exclaimed the chairman. “The deceased was certainly there, and there were no other footprints, so, if they were not his, he must have flown to where he was found.”

“I will call them the footprints of the deceased,” replied Thorndyke imperturbably. “I took a mould of one of them, and with it, on the same mould, one of my own footprints. Here is the mould, and here is a cast from it.” (He turned and took them from the triumphant Polton, who had tenderly lifted them out of the trunk in readiness.) “On looking at the cast, it will be seen that the appearances are not such as would be expected. The deceased was five feet nine inches high, but was very thin and light, weighing only nine stone six pounds, as I ascertained by weighing the body, whereas I am five feet eleven and weigh nearly thirteen stone. But yet the footprint of the deceased is nearly twice as deep as mine—that is to say, the lighter man has sunk into the sand nearly twice as deeply as the heavier man.”

The magistrates were now deeply attentive. They were no longer simply listening to the despised utterances of a mere scientific expert. The cast lay before them with the two footprints side by side; the evidence appealed to their own senses and was proportionately convincing.

“This is very singular,” said the chairman; “but perhaps you can explain the discrepancy?”

“I think I can,” replied Thorndyke; “but I should prefer to place all the facts before you first.”

“Undoubtedly that would be better,” the chairman agreed. “Pray proceed.”

“There was another remarkable peculiarity about these footprints,” Thorndyke continued, “and that was their distance apart—the length of the stride, in fact. I measured the steps carefully from heel to heel, and found them only nineteen and a half inches. But a man of Hearn’s height would have an ordinary stride of about thirty-six inches—more if he was walking fast. Walking with a stride of nineteen and a half inches he would look as if his legs were tied together.

“I next proceeded to the Bay, and took two moulds from the footprints of the man with the nailed shoes, a right and a left. Here is a cast from the mould, and it shows very clearly that the man was walking backwards.”

“How does it show that?” asked the magistrate.

“There are several distinctive points. For instance, the absence of the usual ‘kick off’ at the toe, the slight drag behind the heel, showing the direction in which the foot was lifted, and the undisturbed impression of the sole.”

“You have spoken of moulds and casts. What is the difference between them?”

“A mould is a direct, and therefore reversed, impression. A cast is the impression of a mould, and therefore a facsimile of the object. If I pour liquid plaster on a coin, when it sets I have a mould, a sunk impression, of the coin. If I pour melted wax into the mould I obtain a cast, a facsimile of the coin. A footprint is a mould of the foot. A mould of the footprint is a cast of the foot, and a cast from the mould reproduces the footprint.”

“Thank you,” said the magistrate. “Then your moulds from these two footprints are really facsimiles of the murderer’s shoes, and can be compared with these shoes which have been put in evidence?”

“Yes, and when we compare them they demonstrate a very important fact.”

“What is that?”

“It is that the prisoner’s shoes were not the shoes that made those footprints.” A buzz of astonishment ran through the court, but Thorndyke continued stolidly: “The prisoner’s shoes were not in my possession, so I went on to Barker’s pond, on the clay margin of which I had seen footprints actually made by the prisoner. I took moulds of those footprints, and compared them with these from the sand. There are several important differences, which you will see if you compare them. To facilitate the comparison I have made transparent photographs of both sets of moulds to the same scale. Now, if we put the photograph of the mould of the prisoner’s right shoe over that of the murderer’s right shoe, and hold the two superposed photographs up to the light, we cannot make the two pictures coincide. They are exactly of the same length, but the shoes are of different shape. Moreover, if we put one of the nails in one photograph over the corresponding nail in the other photograph, we cannot make the rest of the nails coincide. But the most conclusive fact of all—from which there is no possible escape—is that the number of nails in the two shoes is not the same. In the sole of the prisoner’s right shoe there
are forty nails; in that of the murderer there are forty-one. The murderer has one nail too many."

There was a deathly silence in the court as the magistrates and Mr. Bashfield pored over the moulds and the prisoner's shoes, and examined the photographs against the light. Then the chairman asked: "Are these all the facts, or have you something more to tell us?" He was evidently anxious to get the key to this riddle.

"There is more evidence, your Worship," said Anstey. "The witness examined the body of deceased." Then, turning to Thorndyke, he asked:

"You were present at the post-mortem examination?"

"I was."

"Did you form any opinion as to the cause of death?"

"Yes. I came to the conclusion that death was occasioned by an overdose of morphia."

A universal gasp of amazement greeted this statement. Then the presiding magistrate protested breathlessly:

"But there was a wound, which we have been told was capable of causing instantaneous death. Was that not the case?"

"There was undoubtedly such a wound," replied Thorndyke. "But when that wound was inflicted the deceased had already been dead from a quarter to half an hour."

"This is incredible!" exclaimed the magistrate. "But, no doubt, you can give us your reasons for this amazing conclusion?"

"My opinion," said Thorndyke, "was based on several facts. In the first place, a wound inflicted on a living body gapes rather widely, owing to the retraction of the living skin. The skin of a dead body does not retract, and the wound, consequently, does not gape. This wound gaped very slightly, showing that death was recent, I should say, within half an hour. Then a wound on the living body becomes filled with blood, and blood is shed freely on the clothing. But the wound on the deceased contained only a little blood-clot. There was hardly any blood on the clothing, and I had already noticed that there was none on the sand where the body had lain."

"And you consider this quite conclusive?" the magistrate asked doubtfully.

"I do," answered Thorndyke. "But there was other evidence which was beyond all question. The weapon had partially divided both the aorta and the pulmonary artery—the main arteries of the body. Now, during life, these great vessels are full of blood at a high internal pressure, whereas after death they become almost empty. It follows that, if this wound had been inflicted during life, the cavity in which those vessels lie would have become filled with blood. As a matter of fact, it contained practically no blood, only the merest oozing from some small veins, so that it is certain that the wound was inflicted after death. The presence and nature of the poison I ascertained by analyzing certain secretions from the body, and the analysis enabled me to judge that the quantity of the poison was large; but the contents of the stomach were sent to Professor Copland for more exact examination."

"Is the result of Professor Copland's analysis known?" the magistrate asked Anstey.

"The professor is here, your Worship," replied Anstey, "and is prepared to swear to having obtained over one grain of morphia from the contents of the stomach; and as this, which is in itself a poisonous dose, is only the unabsorbed residue of what was actually swallowed, the total quantity taken must have been very large indeed."

"Thank you," said the magistrate. "And now, Dr. Thorndyke, if you have given us all the facts, perhaps you will tell us what conclusions you have drawn from them."

"The facts which I have stated," said Thorndyke, "appear to me to indicate the following sequence of events. The deceased died about midnight on September 27, from the effects of a poisonous dose of morphia, how or by whom administered I offer no opinion. I think that his body was conveyed in a boat to Sundersley Gap. The boat probably contained three men, of whom one remained in charge of it, one walked up the Gap and along the cliff towards St. Bridget's Bay, and the third, having put on the shoes of the deceased, carried the body along the shore to the Bay. This would account for the great depth and short stride of the tracks that have been spoken of as those of the deceased. Having reached the Bay, I believe that this man laid the corpse down on his tracks, and then trampled the sand in the neighbourhood. He next took off deceased's shoes and put them on the corpse; then he put on a pair of boots or shoes which he had been carrying—perhaps hung round his neck—and which had been prepared with nails to imitate Draper's shoes. In these shoes he again trampled over the area near the corpse. Then he walked backwards to the Shepherd's Path, and from it again, still backwards, to the face of the cliff. Here his accomplice had lowered a rope, by which he climbed up to the top. At the top he took off the nailed shoes, and the two men walked back to the Gap, where the man who had carried the rope took his confederate on his back, and carried him down to the boat to avoid leaving the tracks of stockinged feet. The tracks that I saw at the Gap certainly indicated that the man was carrying something very heavy when he returned to the boat."

"But why should the man have climbed a rope up the cliff when he could have walked up the Shepherd's Path?" the magistrate asked.

"Because," replied Thorndyke, "there would then have been a set of tracks leading out of the Bay without a corresponding set leading into it; and this would have instantly suggested to a smart police-officer—such as Sergeant..."
Payne—a landing from a boat."

"Your explanation is highly ingenious," said the magistrate, "and appears to cover all the very remarkable facts. Have you anything more to tell us?"

"No, your Worship," was the reply, "excepting" (here he took from Polton the last pair of moulds and passed them up to the magistrate) "that you will probably find these moulds of importance presently."

As Thorndyke stepped from the box—for there was no cross-examination—the magistrates scrutinized the moulds with an air of perplexity; but they were too discreet to make any remark.

When the evidence of Professor Copland (which showed that an unquestionably lethal dose of morphia must have been swallowed) had been taken, the clerk called out the—to me—unfamiliar name of Jacob Gummer. Thereupon an enormous pair of brown dreadnought trousers, from the upper end of which a smack-boy's head and shoulders protruded, walked into the witness-box.

Jacob admitted at the outset that he was a smack-master's apprentice, and that he had been "hired out" by his master to one Mr. Jezzard as deck-hand and cabin-boy of the yacht Otter.

"Now, Gummer," said Anstey, "do you remember the prisoner coming on board the yacht?"

"Yes. He has been on board twice. The first time was about a month ago. He went for a sail with us then. The second time was on the night when Mr. Hearn was murdered."

"Do you remember what sort of boots the prisoner was wearing the first time he came?"

"Yes. They were shoes with a lot of nails in the soles. I remember them because Mr. Jezzard made him take them off and put on a canvas pair."

"What was done with the nailed shoes?"

"Mr. Jezzard took 'em below to the cabin."

"And did Mr. Jezzard come up on deck again directly?"

"No. He stayed down in the cabin about ten minutes."

"Do you remember a parcel being delivered on board from a London boot-maker?"

"Yes. The postman brought it about four or five days after Mr. Draper had been on board. It was labelled 'Walker Bros., Boot and Shoe Makers, London.' Mr. Jezzard took a pair of shoes from it, for I saw them on the locker in the cabin the same day."

"Did you ever see him wear them?"

"No. I never see 'em again."

"Have you ever heard sounds of hammering on the yacht?"

"Yes. The night after the parcel came I was on the quay alongside, and I heard someone a-hammering in the cabin."

"What did the hammering sound like?"

"It sounded like a cobbler a-hammering in nails."

"Have you over seen any boot-nails on the yacht?"

"Yes. When I was a-clearin' up the cabin the next mornin', I found a hobnail on the floor in a corner by the locker."

"Were you on board on the night when Mr. Hearn died?"

"Yes. I'd been ashore, but I came aboard about half-past nine."

"Did you see Mr. Hearn go ashore?"

"I see him leave the yacht. I had turned into my bunk and gone to sleep, when Mr. Jezzard calls down to me: 'We're putting Mr. Hearn ashore,' says he; 'and then,' he says, 'we're a-going for an hour's fishing. You needn't sit up,' he says, and with that he shuts the scuttle. Then I got up and slid back the scuttle and put my head out, and I see Mr. Jezzard and Mr. Leach a-helpin' Mr. Hearn acrost the deck. Mr. Hearn he looked as if he was drunk. They got him into the boat—and a rare job they had—and Mr. Pittford, what was in the boat already, he pushed off. And then I popped my head in again, 'cause I didn't want them to see me."

"Did they row to the steps?"

"No. I put my head out again when they were gone, and I heard 'em row round the yacht, and then pull out towards the mouth of the harbour. I couldn't see the boat, 'cause it was a very dark night."

"Very well. Now I am going to ask you about another matter. Do you know anyone of the name of Polton?"

"Yes," replied Gummer, turning a dusky red. "I've just found out his real name. I thought he was called Simmons."

"Tell us what you know about him," said Anstey, with a mischievous smile.
"Well," said the boy, with a ferocious scowl at the bland and smiling Polton, "one day he come down to the yacht when the gentlemen had gone ashore. I believe he'd seen 'em go. And he offers me ten shillin' to let him see all the boots and shoes we'd got on board. I didn't see no harm, so I turns out the whole lot in the cabin for him to look at. While he was lookin' at 'em he asks me to fetch a pair of mine from the fo'c'sle, so I fetches 'em. When I come back he was pitchin' the boots and shoes back into the locker. Then, presently, he nips off, and when he was gone I looked over the shoes, and then I found there was a pair missing. They was an old pair of Mr. Jezzard's, and what made him nick 'em is more than I can understand."

"Would you know those shoes if you saw them?"

"Yes, I should," replied the lad.

"Are these the pair?" Anstey handed the boy a pair of dilapidated canvas shoes, which he seized eagerly.

"Yes, these is the ones what he stole!" he exclaimed.

Anstey took them back from the boy's reluctant hands, and passed them up to the magistrate's desk. "I think," said he, "that if your Worship will compare these shoes with the last pair of moulds, you will have no doubt that these are the shoes which made the footprints from the sea to Sundersley Gap and back again."

The magistrates together compared the shoes and the moulds amidst a breathless silence. At length the chairman laid them down on the desk.

"It is impossible to doubt it," said he. "The broken heel and the tear in the rubber sole, with the remains of the chequered pattern, make the identity practically certain."

As the chairman made this statement I involuntarily glanced round to the place where Jezzard was sitting. But he was not there; neither he, nor Pitford, nor Leach. Taking advantage of the preoccupation of the Court, they had quietly slipped out of the door. But I was not the only person who had noted their absence. The inspector and the sergeant were already in earnest consultation, and a minute later they, too, hurriedly departed.

The proceedings now speedily came to an end. After a brief discussion with his brother-magistrates, the chairman addressed the Court.

"The remarkable and I may say startling evidence, which has been heard in this court to-day, if it has not fixed the guilt of this crime on any individual, has, at any rate, made it clear to our satisfaction that the prisoner is not the guilty person, and he is accordingly discharged. Mr. Draper, I have great pleasure in informing you that you are at liberty to leave the court, and that you do so entirely clear of all suspicion; and I congratulate you very heartily on the skill and ingenuity of your legal advisers, but for which the decision of the Court would, I am afraid, have been very different."

That evening, lawyers, witnesses, and the jubilant and grateful client gathered round a truly festive board to dine, and fight over again the battle of the day. But we were scarcely halfway through our meal when, to the indignation of the servants, Sergeant Payne burst breathlessly into the room.

"They've gone, sir!" he exclaimed, addressing Thorndyke. "They've given us the slip for good."

"Why, how can that be?" asked Thorndyke.

"They're dead, sir! All three of them!"

"Dead!" we all exclaimed.

"Yes. They made a burst for the yacht when they left the court, and they got on board and put out to sea at once, hoping, no doubt, to get clear as the light was just failing. But they were in such a hurry that they did not see a steam trawler that was entering, and was hidden by the pier. Then, just at the entrance, as the yacht was creeping out, the trawler hit her amidships, and fairly cut her in two. The three men were in the water in an instant, and were swept away in the eddy behind the north pier; and before any boat could put out to them they had all gone under. Jezzard's body came up on the beach just as I was coming away."

We were all silent and a little awed, but if any of us felt regret at the catastrophe, it was at the thought that three such cold-blooded villains should have made so easy an exit; and to one of us, at least, the news came as a blessed relief.

II. — THE STRANGER’S LATCHKEY

THE contrariety of human nature is a subject that has given a surprising amount of occupation to makers of proverbs and to those moral philosophers who make it their province to discover and expound the glaringly obvious; and especially have they been concerned to enlarge upon that form of perverseness which engenders dislike of things offered under compulsion, and arouses desire of them as soon as their attainment becomes difficult or impossible. They assure us that a man who has had a given thing within his reach and put it by, will, as soon as it is beyond his reach, find it the one thing necessary and desirable; even as the domestic cat which has turned disdainfully from the preferred saucer, may presently be seen with her head jammed hard in the milk-jug, or, secretly and with horrible relish, slaking her thirst at the scullery sink.

To this peculiarity of the human mind was due, no doubt, the fact that no sooner had I abandoned the clinical side of my
profession in favour of the legal, and taken up my abode in the chambers of my friend Thorndyke, the famous medico-legal expert, to act as his assistant or junior, than my former mode of life—that of a locum tenens, or minder of other men’s practices—which had, when I was following it, seemed intolerably irksome, now appeared to possess many desirable features; and I found myself occasionally hankering to sit once more by the bedside, to puzzle out the perplexing train of symptoms, and to wield that power—the greatest, after all, possessed by man—the power to banish suffering and ward off the approach of death itself.

Hence it was that on a certain morning of the long vacation I found myself installed at The Larches, Burling, in full charge of the practice of my old friend Dr. Hanshaw, who was taking a fishing holiday in Norway. I was not left desolate, however, for Mrs. Hanshaw remained at her post, and the roomy, old-fashioned house accommodated three visitors in addition. One of these was Dr. Hanshaw’s sister, a Mrs. Haldean, the widow of a wealthy Manchester cotton factor; the second was her niece by marriage, Miss Lucy Haldean, a very handsome and charming girl of twenty-three; while the third was no less a person than Master Fred, the only child of Mrs. Haldean, and a strapping boy of six.

“It is quite like old times—and very pleasant old times, too—to see you sitting at our breakfast-table, Dr. Jervis.” With these gracious words and a friendly smile, Mrs. Hanshaw handed me my tea-cup.

I bowed. “The highest pleasure of the altruist,” I replied, “is in contemplating the good fortune of others.”

Mrs. Haldean laughed. “Thank you,” she said. “You are quite unchanged, I perceive. Still as suave and as—shall I say oleaginous?”

“No, please don’t!” I exclaimed in a tone of alarm.

“Then I won’t. But what does Dr. Thorndyke say to this backsliding on your part? How does he regard this relapse from medical jurisprudence to common general practice?”

“Thorndyke,” said I, “is unmoved by any catastrophe; and he not only regards the ‘Decline and Fall-off of the Medical Jurist’ with philosophic calm, but he even favours the relapse, as you call it. He thinks it may be useful to me to study the application of medico-legal methods to general practice.”

“That sounds rather unpleasant—for the patients, I mean,” remarked Miss Haldean.

“Very,” agreed her aunt. “Most cold-blooded. What sort of man is Dr. Thorndyke? I feel quite curious about him. Is he at all human, for instance?”

“He is entirely human,” I replied; “the accepted tests of humanity being, as I understand, the habitual adoption of the erect posture in locomotion, and the relative position of the end of the thumb—”

“I don’t mean that,” interrupted Mrs. Haldean. “I mean human in things that matter.”

“I think those things matter,” I rejoined. “Consider, Mrs. Haldean, what would happen if my learned colleague were to be seen in wig and gown, walking towards the Law Courts in any posture other than the erect. It would be a public scandal.”

“Don’t talk to him, Mabel,” said Mrs. Hanshaw; “he is incorrigible. What are you doing with yourself this morning, Lucy?”

Miss Haldean (who had hastily set down her cup to laugh at my imaginary picture of Dr. Thorndyke in the character of a quadruped) considered a moment.

“I think I shall sketch that group of birches at the edge of Bradham Wood,” she said.

“Then, in that case,” said I, “I can carry your traps for you, for I have to see a patient in Bradham.”

“He is making the most of his time,” remarked Mrs. Haldean maliciously to her hostess. “He knows that when Mr. Winter arrives he will retire into the extreme background.”

Douglas Winter, whose arrival was expected in the course of the week, was Miss Haldean’s fiancé. Their engagement had been somewhat protracted, and was likely to be more so, unless one of them received some unexpected accession of means; for Douglas was a subaltern in the Royal Engineers, living, with great difficulty, on his pay, while Lucy Haldean subsisted on an almost invisible allowance left her by an uncle.

I was about to reply to Mrs. Haldean when a patient was announced, and, as I had finished my breakfast, I made my excuses and left the table.

Half an hour later, when I started along the road to the village of Bradham, I had two companions. Master Freddy had joined the party, and he disputed with me the privilege of carrying the “traps,” with the result that a compromise was effected, by which he carried the camp-stool, leaving me in possession of the easel, the bag, and a large bound sketching-block.

“Where are you going to work this morning?” I asked, when we had trudged on some distance.

“Just off the road to the left there, at the edge of the wood. Not very far from the house of the mysterious stranger.” She glanced at me mischievously as she made this reply, and chuckled with delight when I rose at the bait.

“What house do you mean?” I inquired.

“Ha!” she exclaimed, “the investigator of mysteries is aroused. He saith, ‘Ha! ha!’ amidst the trumpets; he smelheth the
battle afar off.

“Explain instantly,” I commanded, “or I drop your sketch-block into the very next puddle.”

“You terrify me,” said she. “But I will explain, only there isn’t any mystery except to the bucolic mind. The house is called Lavender Cottage, and it stands alone in the fields behind the wood. A fortnight ago it was let furnished to a stranger named Whitelock, who has taken it for the purpose of studying the botany of the district; and the only really mysterious thing about him is that no one has seen him. All arrangements with the house-agent were made by letter, and, as far as I can make out, none of the local tradespeople supply him, so he must get his things from a distance—even his bread, which really is rather odd. Now say I am an inquisitive, gossiping country bumpkin.”

“I was going to,” I answered, “but it is no use now.”

She relieved me of her sketching appliances with pretended indignation, and crossed into the meadow, leaving me to pursue my way alone; and when I presently looked back, she was setting up her easel and stool, gravely assisted by Freddy.

My “round,” though not a long one, took up more time than I had anticipated, and it was already past the luncheon hour when I passed the place where I had left Miss Haldean. She was gone, as I had expected, and I hurried homewards, anxious to be as nearly punctual as possible. When I entered the dining-room, I found Mrs. Haldean and our hostess seated at the table, and both looked up at me expectantly.

“Have you seen Lucy?” the former inquired.

“No,” I answered. “Hasn’t she come back? I expected to find her here. She had left the wood when I passed just now.”

Mrs. Haldean knitted her brows anxiously. “It is very strange,” she said, “and very thoughtless of her. Freddy will be famished.”

I hurried over my lunch, for two fresh messages had come in from outlying hamlets, effectually dispelling my visions of a quiet afternoon; and as the minutes passed without bringing any signs of the absentees, Mrs. Haldean became more and more restless and anxious. At length her suspense became unbearable; she rose suddenly, announcing her intention of cycling up the road to look for the defaulters, but as she was moving towards the door, it burst open, and Lucy Haldean staggered into the room.

Her appearance filled us with alarm. She was deadly pale, breathless, and wild-eyed; her dress was draggled and torn, and she trembled from head to foot.

“Good God, Lucy!” gasped Mrs. Haldean. “What has happened? And where is Freddy?” she added in a sterner tone.

“He is lost!” replied Miss Haldean in a faint voice, and with a catch in her breath. “He strayed away while I was painting. I have searched the wood through, and called to him, and looked in all the meadows. Oh! where can he have gone?” Her sketching “kit,” with which she was loaded, slipped from her grasp and rattled on to the floor, and she buried her face in her hands and sobbed hysterically.

“And you have dared to come back without him?” exclaimed Mrs. Haldean.

“I was getting exhausted. I came back for help,” was the faint reply.

“Of course she was exhausted,” said Mrs. Hanshaw. “Come, Lucy; come, Mabel; don’t make mountains out of molehills. The little man is safe enough. We shall find him presently, or he will come home by himself. Come and have some food, Lucy.”

Miss Haldean shook her head. “I can’t, Mrs. Hanshaw—really I can’t,” she said; and, seeing that she was in a state of utter exhaustion, I poured out a glass of wine and made her drink it.

Mrs. Haldean darted from the room, and returned immediately, putting on her hat. “You have got to come with me and show me where you lost him,” she said.

“She can’t do that, you know,” I said rather brusquely. “She will have to lie down for the present. But I know the place, and will cycle up with you.”

“Very well,” replied Mrs. Haldean, “that will do. What time was it,” she asked, turning to her niece, “when you lost the child? and which way—”

She paused abruptly, and I looked at her in surprise. She had suddenly turned ashen and ghastly; her face had set like a mask of stone, with parted lips and staring eyes that were fixed in horror on her niece.

There was a deathly silence for a few seconds. Then, in a terrible voice, she demanded: “What is that on your dress, Lucy?” And, after a pause, her voice rose into a shriek. “What have you done to my boy?”

I glanced in astonishment at the dazed and terrified girl, and then I saw what her aunt had seen—a good-sized blood-stain halfway down the front of her skirt, and another smaller one on her right sleeve. The girl herself looked down at the sinister patch of red and then up at her aunt. “It looks like—like blood,” she stammered. “Yes, it is—I think—of course it is. He struck his nose—and it bled—”

“Come,” interrupted Mrs. Haldean, “let us go,” and she rushed from the room, leaving me to follow.

I lifted Miss Haldean, who was half fainting with fatigue and agitation, on to the sofa, and, whispering a few words of
encouragement into her ear, turned to Mrs. Hanshaw.

“I can’t stay with Mrs. Haldean,” I said. “There are two visits to be made at Rebworth. Will you send the dogcart up the road with somebody to take my place?”

“Yes,” she answered. “I will send Giles, or come myself if Lucy is fit to be left.”

I ran to the stables for my bicycle, and as I pedalled out into the road I could see Mrs. Haldean already far ahead, driving her machine at frantic speed. I followed at a rapid pace, but it was not until we approached the commencement of the wood, when she slowed down somewhat, that I overtook her.

“This is the place,” I said, as we reached the spot where I had parted from Miss Haldean. We dismounted and wheeled our bicycles through the gate, and laying them down beside the hedge, crossed the meadow and entered the wood.

It was a terrible experience, and one that I shall never forget—the white-faced, distracted woman, tramping in her flimsy house-shoes over the rough ground, bursting through the bushes, regardless of the thorny branches that dragged at skin and hair and dainty clothing, and sending forth from time to time a tremulous cry, so dreadfully pathetic in its mingling of terror and coaxing softness, that a lump rose in my throat, and I could barely keep my self-control.

“Freddy! Freddy-boy! Mummy’s here, darling!” The wailing cry sounded through the leafy solitude; but no answer came save the whirr of wings or the chatter of startled birds. But even more shocking than that terrible cry—more disturbing and eloquent with dreadful suggestion—was the way in which she peered, furtively, but with fearful expectation, among the roots of the bushes, or halted to gaze upon every molehill and hummock, every depression or disturbance of the ground.

So we stumbled on for a while, with never a word spoken, until we came to a beaten track or footpath leading across the wood. Here I paused to examine the footprints, of which several were visible in the soft earth, though none seemed very recent; but, proceeding a little way down the track, I perceived, crossing it, a set of fresh imprints, which I recognized at once as Miss Haldean’s. She was wearing, as I knew, a pair of brown golf-boots, with rubber pads in the leather soles, and the prints made by them were unmistakable.

“Miss Haldean crossed the path here,” I said, pointing to the footprints.

“Don’t speak of her before me!” exclaimed Mrs. Haldean; but she gazed eagerly at the footprints, nevertheless, and immediately plunged into the wood to follow the tracks.

“You are very unjust to your niece, Mrs. Haldean,” I ventured to protest.

She halted, and faced me with an angry frown.

“You don’t understand!” she exclaimed. “You don’t know, perhaps, that if my poor child is really dead, Lucy Haldean will be a rich woman, and may marry to-morrow if she chooses?”

“I did not know that,” I answered, “but if I had, I should have said the same.”

“Of course you would,” she retorted bitterly. “A pretty face can muddle any man’s judgment.”

She turned away abruptly to resume her pursuit, and I followed in silence. The trail which we were following zigzagged through the thickest part of the wood, but its devious windings eventually brought us out on to an open space on the farther side. Here we at once perceived traces of another kind. A litter of dirty rags, pieces of paper, scraps of stale bread, bones and feathers, with hoof-marks, wheel ruts, and the ashes of a large wood fire, pointed clearly to a gipsy encampment recently broken up. I laid my hand on the heap of ashes, and found it still warm, and on scattering it with my foot a layer of glowing cinders appeared at the bottom.

“These people have only been gone an hour or two,” I said. “It would be well to have them followed without delay.”

A gleam of hope shone on the drawn, white face as the bereaved mother caught eagerly at my suggestion.

“Yes,” she exclaimed breathlessly; “she may have bribed them to take him away. Let us see which way they went.”

We followed the wheel tracks down to the road, and found that they turned towards London. At the same time I perceived the dogcart in the distance, with Mrs. Hanshaw standing beside it; and, as the coachman observed me, he whipped up his horse and approached.

“I shall have to go,” I said, “but Mrs. Hanshaw will help you to continue the search.”

“And you will make inquiries about the gipsies, won’t you?” she said.

I promised to do so, and as the dogcart now came up, I climbed to the seat, and drove off briskly up the London Road.

The extent of a country doctor’s round is always an unknown quantity. On the present occasion I picked up three additional patients, and as one of them was a case of incipient pleurisy, which required to have the chest strapped, and another was a neglected dislocation of the shoulder, a great deal of time was taken up. Moreover, the gipsies, whom I ran to earth on Rebworth Common, delayed me considerably, though I had to leave the rural constable to carry out the actual search, and, as a result, the clock of Burling Church was striking six as I drove through the village on my way home.

I got down at the front gate, leaving the coachman to take the dogcart round, and walked up the drive; and my astonishment may be imagined when, on turning the corner, I came suddenly upon the inspector of the local police in earnest conversation with no less a person than John Thorndyke.
“What on earth has brought you here?” I exclaimed, my surprise getting the better of my manners.

“The ultimate motive-force,” he replied, “was an impulsive lady named Mrs. Haldean. She telegraphed for me—in your name.”

“She oughtn’t to have done that,” I said.

“Perhaps not. But the ethics of an agitated woman are not worth discussing, and she has done something much worse—she has applied to the local J.P. (a retired Major-General), and our gallant and unlearned friend has issued a warrant for the arrest of Lucy Haldean on the charge of murder.”

“But there has been no murder!” I exclaimed.

“That,” said Thorndyke, “is a legal subtlety that he does not appreciate. He has learned his law in the orderly-room, where the qualifications to practise are an irritable temper and a loud voice. However, the practical point is, inspector, that the warrant is irregular. You can’t arrest people for hypothetical crimes.”

The officer drew a deep breath of relief. He knew all about the irregularity, and now joyfully took refuge behind Thorndyke’s great reputation.

When he had departed—with a brief note from my colleague to the General—Thorndyke slipped his arm through mine, and we strolled towards the house.

“This is a grim business, Jervis,” said he. “That boy has got to be found for everybody’s sake. Can you come with me when you have had some food?”

“Of course I can. I have been saving myself all the afternoon with a view to continuing the search.”

“Good,” said Thorndyke. “Then come in and feed.”

A nondescript meal, half tea and half dinner, was already prepared, and Mrs. Hanshaw, grave but self-possessed, presided at the table.

“Mabel is still out with Giles, searching for the boy,” she said. “You have heard what she has done!”

I nodded.

“It was dreadful of her,” continued Mrs. Hanshaw, “but she is half mad, poor thing. You might run up and say a few kind words to poor Lucy while I make the tea.”

I went up at once and knocked at Miss Haldean’s door, and, being hidden to enter, found her lying on the sofa, red-eyed and pale, the very ghost of the merry, laughing girl who had gone out with me in the morning. I drew up a chair, and sat down by her side, and as I took the hand she held out to me, she said:

“It is good of you to come and see a miserable wretch like me. And Jane has been so sweet to me, Dr. Jervis; but Aunt Mabel thinks I have killed Freddy—you know she does—and it was really my fault that he was lost. I shall never forgive myself!”

She burst into a passion of sobbing, and I proceeded to chide her gently.

“You are a silly little woman,” I said, “to take this nonsense to heart as you are doing. Your aunt is not responsible just now, as you must know; but when we bring the boy home she shall make you a handsome apology. I will see to that.”

She pressed my hand gratefully, and as the bell now rang for tea, I bade her have courage and went downstairs.

“You need not trouble about the practice,” said Mrs. Hanshaw, as I concluded my lightning repast, and Thorndyke went off to get our bicycles. “Dr. Symons has heard of our trouble, and has called to say that he will take anything that turns up; so we shall expect you when we see you.”

“How do you like Thorndyke?” I asked.

“He is quite charming,” she replied enthusiastically; “so tactful and kind, and so handsome, too. You didn’t tell us that. But here he is. Good-bye, and good luck.”

She pressed my hand, and I went out into the drive, where Thorndyke and the coachman were standing with three bicycles.

“I see you have brought your outfit,” I said as we turned into the road; for Thorndyke’s machine bore a large canvas-covered case strapped on to a strong bracket.

“Yes; there are many things that we may want on a quest of this kind. How did you find Miss Haldean?”

“Very miserable, poor girl. By the way, have you heard anything about her pecuniary interest in the child’s death?”

“Yes,” said Thorndyke. “It appears that the late Mr. Haldean used up all his brains on his business, and had none left for the making of his will—as often happens. He left almost the whole of his property—about eighty thousand pounds—to his son, the widow to have a life-interest in it. He also left to his late brother’s daughter, Lucy, fifty pounds a year, and to his surviving brother Percy, who seems to have been a good-for-nothing, a hundred a year for life. But—and here is the utter folly of the thing—if the son should die, the property was to be equally divided between the brother and the niece, with the exception of five hundred a year for life to the widow. It was an insane arrangement.”
“Quite,” I agreed, “and a very dangerous one for Lucy Haldean, as things are at present.”

“Very; especially if anything should have happened to the child.”

“What are you going to do now?” I inquired, seeing that Thorndyke rode on as if with a definite purpose.

“There is a footpath through the wood,” he replied. “I want to examine that. And there is a house behind the wood which I should like to see.”

“The house of the mysterious stranger,” I suggested.

“Precisely. Mysterious and solitary strangers invite inquiry.”

We drew up at the entrance to the footpath, leaving Willett the coachman in charge of the three machines, and proceeded up the narrow track. As we went, Thorndyke looked back at the prints of our feet, and nodded approvingly.

“This soft loam,” he remarked, “yields beautifully clear impressions, and yesterday’s rain has made it perfect.”

We had not gone far when we perceived a set of footprints which I recognized, as did Thorndyke also, for he remarked: “Miss Haldean—running, and alone.” Presently we met them again, crossing in the opposite direction, together with the prints of small shoes with very high heels. “Mrs. Haldean on the track of her niece,” was Thorndyke’s comment; and a minute later we encountered them both again, accompanied by my own footprints.

“The boy does not seem to have crossed the path at all,” I remarked as we walked on, keeping off the track itself to avoid confusing the footprints.

“We shall know when we have examined the whole length,” replied Thorndyke, plodding on with his eyes on the ground. “Ha! here is something new,” he added, stopping short and stooping down eagerly—“a man with a thick stick—a smallish man, rather lame. Notice the difference between the two feet, and the peculiar way in which he uses his stick. Yes, Jervis, there is a great deal to interest us in these footprints. Do you notice anything very suggestive about them?”

“Nothing but what you have mentioned,” I replied. “What do you mean?”

“Well, first there is the very singular character of the prints themselves, which we will consider presently. You observe that this man came down the path, and at this point turned off into the wood; then he returned from the wood and went up the path again. The imposition of the prints makes that clear. But now look at the two sets of prints, and compare them. Do you notice any difference?”

“The returning footprints seem more distinct—better impressions.”

“Yes; they are noticeably deeper. But there is something else.” He produced a spring tape from his pocket, and took half a dozen measurements. “You see,” he said, “the first set of footprints have a stride of twenty-one inches from heel to heel—a short stride; but he is a smallish man, and lame; the returning ones have a stride of only nineteen and a half inches; hence the returning footprints are deeper than the others, and the steps are shorter. What do you make of that?”

“It would suggest that he was carrying a burden when he returned,” I replied.

“Yes; and a heavy one, to make that difference in the depth. I think I will get you to go and fetch Willett and the bicycles.”

I strode off down the path to the entrance, and, taking possession of Thorndyke’s machine, with its precious case of instruments, bade Willett follow with the other two.

When I returned, my colleague was standing with his hands behind him, gazing with intense preoccupation at the footprints. He looked up sharply as we approached, and called out to us to keep off the path if possible.

“Stay here with the machines, Willett,” said he. “You and I, Jervis, must go and see where our friend went to when he left the path, and what was the burden that he picked up.”

We struck off into the wood, where last year’s dead leaves made the footprints almost indistinguishable, and followed the faint double track for a long distance between the dense clumps of bushes. Suddenly my eye caught, beside the double trail, a third row of tracks, smaller in size and closer together. Thorndyke had seen them, too, and already his measuring-tape was in his hand.

“Eleven and a half inches to the stride,” said he. “That will be the boy, Jervis. But the light is getting weak. We must press on quickly, or we shall lose it.”

Some fifty yards farther on, the man’s tracks ceased abruptly, but the small ones continued alone; and we followed them as rapidly as we could in the fading light.

“There can be no reasonable doubt that these are the child’s tracks,” said Thorndyke; “but I should like to find a definite footprint to make the identification absolutely certain.”

A few seconds later he halted with an exclamation, and stooped on one knee. A little heap of fresh earth from the surface-burrow of a mole had been thrown up over the dead leaves; and fairly planted on it was the clean and sharp impression of a diminutive foot, with a rubber heel showing a central star. Thorndyke drew from his pocket a tiny shoe, and pressed it on the soft earth beside the footprint; and when he raised it the second impression was identical with the first.
“The boy had two pairs of shoes exactly alike,” he said, “so I borrowed one of the duplicate pair.”

He turned, and began to retrace his steps rapidly, following our own fresh tracks, and stopping only once to point out the place where the unknown man had picked the child up. When we regained the path we proceeded without delay until we emerged from the wood within a hundred yards of the cottage.

“I see Mrs. Haldean has been here with Giles,” remarked Thorndyke, as he pushed open the garden-gate. “I wonder if they saw anybody.”

He advanced to the door, and having first rapped with his knuckles and then kicked at it vigorously, tried the handle.

“Locked,” he observed, “but I see the key is in the lock, so we can get in if we want to. Let us try the back.”

The back door was locked, too, but the key had been removed.

“He came out this way, evidently,” said Thorndyke, “though he went in at the front, as I suppose you noticed. Let us see where he went.”

The back garden was a small, fenced patch of ground, with an earth path leading down to the back gate. A little way beyond the gate was a small barn or outhouse.

“We are in luck,” Thorndyke remarked, with a glance at the path. “Yesterday’s rain has cleared away all old footprints, and prepared the surface for new ones. You see there are three sets of excellent impressions—two leading away from the house, and one set towards it. Now, you notice that both of the sets leading from the house are characterized by deep impressions and short steps, while the set leading to the house has lighter impressions and longer steps. The obvious inference is that he went down the path with a heavy burden, came back empty-handed, and went down again—and finally—with another heavy burden. You observe, too, that he walked with his stick on each occasion.”

By this time we had reached the bottom of the garden. Opening the gate, we followed the tracks towards the outhouse, which stood beside a cart-track; but as we came round the corner we both stopped short and looked at one another. On the soft earth were the very distinct impressions of the tyres of a motor-car leading from the wide door of the outhouse. Finding that the door was unfastened, Thorndyke opened it, and looked in, to satisfy himself that the place was empty. Then he fell to studying the tracks.

“The course of events is pretty plain,” he observed. “First the fellow brought down his luggage, started the engine, and got the car out—you can see where it stood, both by the little pool of oil, and by the widening and blurring of the wheel-tracks from the vibration of the free engine; then he went back and fetched the boy—carried him pick-a-back, I should say, judging by the depth of the toe-marks in the last set of footprints. That was a tactical mistake. He should have taken the boy straight into the shed.”

He pointed as he spoke to one of the footprints beside the wheel-tracks, from the toe of which projected a small segment of the print of a little rubber heel.

We now made our way back to the house, where we found Willett pensively rapping at the front door with a cycle-spanner. Thorndyke took a last glance, with his hand in his pocket, at an open window above, and then, to the coachman’s intense delight, brought forth what looked uncommonly like a small bunch of skeleton keys. One of these he inserted into the keyhole, and as he gave it a turn, the lock clicked, and the door stood open.

The little sitting-room, which we now entered, was furnished with the barest necessities. Its centre was occupied by an oilcloth-covered table, on which I observed with surprise a dismembered “Bee” clock (the works of which had been taken apart with a tin-opener that lay beside them) and a box-wood bird-call. At these objects Thorndyke glanced and nodded, as though they fitted into some theory that he had formed; examined carefully the oilcloth around the litter of wheels and pinions, and then proceeded on a tour of inspection round the room, peering inquisitively into the kitchen and store-cupboard.

“Nothing very distinctive or personal here,” he remarked. “Let us go upstairs.”

There were three bedrooms on the upper floor, of which two were evidently disused, though the windows were wide open. The third bedroom showed manifest traces of occupation, though it was as bare as the others, for the water still stood in the wash-hand basin, and the bed was unmade. To the latter Thorndyke advanced, and, having turned back the bedclothes, examined the interior attentively, especially at the foot and the pillow. The latter was soiled—not to say grimy—though the rest of the bed-linen was quite clean.

“Hair-dye,” remarked Thorndyke, noting my glance at it; then he turned and looked out of the open window. “Can you see the place where Miss Haldean was sitting to sketch?” he asked.

“Yes,” I replied; “there is the place well in view, and you can see right up the road. I had no idea this house stood so high. From the three upper windows you can see all over the country excepting through the wood.”

“Yes,” Thorndyke rejoined, “and he has probably been in the habit of keeping watch up here with a telescope or a pair of field-glasses. Well, there is not much of interest in this room. He kept his effects in a cabin trunk which stood there under the window. He shaved this morning. He has a white beard, to judge by the stubble on the shaving-paper, and that is all. Wait, though. There is a key hanging on that nail. He must have overlooked that, for it evidently does not belong to this house. It is an ordinary town latchkey.”
He took the key down, and having laid a sheet of notepaper, from his pocket, on the dressing-table, produced a pin, with which he began carefully to probe the interior of the key-barrel. Presently there came forth, with much coaxing, a large ball of grey fluff, which Thorndyke folded up in the paper with infinite care.

“I suppose we mustn’t take away the key,” he said, “but I think we will take a wax mould of it.”

He hurried downstairs, and, unstrapping the case from his bicycle, brought it in and placed it on the table. As it was now getting dark, he detached the powerful acetylene lamp from his machine, and, having lighted it, proceeded to open the mysterious case. First he took from it a small insufflutor, or powder-blower, with which he blew a cloud of light yellow powder over the table around the remains of the clock. The powder settled on the table in an even coating, but when he blew at it smartly with his breath, it cleared off, leaving, however, a number of smeary impressions which stood out in strong yellow against the black oilcloth. To one of these impressions he pointed significantly. It was the print of a child’s hand.

He next produced a small, portable microscope and some glass slides and cover-slips, and having opened the paper and tipped the ball of fluff from the key-barrel on to a slide, set to work with a pair of mounted needles to tease it out into its component parts. Then he turned the light of the lamp on to the microscope mirror and proceeded to examine the specimen.

“A curious and instructive assortment this, Jervis,” he remarked, with his eye at the microscope: “woollen fibres—no cotton or linen; he is careful of his health to have woollen pockets—and two hairs; very curious ones, too. Just look at them, and observe the root bulbs.”

I applied my eye to the microscope, and saw, among other things, two hairs—originally white, but encrusted with a black, opaque, glistening stain. The root bulbs, I noticed, were shrivelled and atrophied.

“But how on earth,” I exclaimed, “did the hairs get into his pocket?”

“I think the hairs themselves answer that question,” he replied, “when considered with the other curios. The stain is obviously lead sulphide; but what else do you see?”

“I see some particles of metal—a white metal apparently—and a number of fragments of woody fibre and starch granules, but I don’t recognize the starch. It is not wheat-starch, nor rice, nor potato. Do you make out what it is?”

Thorndyke chuckled. “Experientia does it,” said he. “You will have, Jervis, to study the minute properties of dust and dirt. Their evidential value is immense. Let us have another look at that starch; it is all alike, I suppose.”

It was; and Thorndyke had just ascertained the fact when the door burst open and Mrs. Haldean entered the room, followed by Mrs. Hanshaw and the police inspector. The former lady regarded my colleague with a glance of extreme
disfavour.

"We heard that you had come here, sir," said she, "and we supposed you were engaged in searching for my poor child. But it seems we were mistaken, since we find you here amusing yourselves fiddling with these nonsensical instruments."

"Perhaps, Mabel," said Mrs. Hanshaw stiffly, "it would be wiser, and infinitely more polite, to ask if Dr. Thorndyke has any news for us."

"That is undoubtedly so, madam," agreed the inspector, who had apparently suffered also from Mrs. Haldean's impulsiveness.

"Then perhaps," the latter lady suggested, "you will inform us if you have discovered anything."

"I will tell you," replied Thorndyke, "all that we know. The child was abducted by the man who occupied this house, and who appears to have watched him from an upper window, probably through a glass. This man lured the child into the wood by blowing this bird-call; he met him in the wood, and induced him—by some promises, no doubt—to come with him. He picked the child up and carried him—on his back, I think—up to the house, and brought him in through the front door, which he locked after him. He gave the boy this clock and the bird-call to amuse him while he went up-stairs and packed his trunk. He took the trunk out through the back door and down the garden to the shed there, in which he had a motor-car. He got the car out and came back for the boy, whom he carried down to the car, locking the back door after him. Then he drove away."

"You know he has gone," cried Mrs. Haldean, "and yet you stay here playing with these ridiculous toys. Why are you not following him?"

"We have just finished ascertaining the facts," Thorndyke replied calmly, "and should by now be on the road if you had not come."

Here the inspector interposed anxiously. "Of course, sir, you can't give any description of the man. You have no clue to his identity, I suppose?"

"We have only his footprints," Thorndyke answered, "and this fluff which I raked out of the barrel of his latchkey, and have just been examining. From these data I conclude that he is a rather short and thin man, and somewhat lame. He walks with the aid of a thick stick, which has a knob, not a crook, at the top, and which he carries in his left hand. I think that his left leg has been amputated above the knee, and that he wears an artificial limb. He is elderly, he shaves his beard, has white hair dyed a greyish black, is partly bald, and probably combs a wisp of hair over the bald place; he takes snuff, and carries a leaden comb in his pocket."

As Thorndyke's description proceeded, the inspector's mouth gradually opened wider and wider, until he appeared the very type and symbol of astonishment. But its effect on Mrs. Haldean was much more remarkable. Rising from her chair, she leaned on the table and stared at Thorndyke with an expression of awe—even of terror; and as he finished she sank back into her chair, with her hands clasped, and turned to Mrs. Hanshaw.

"Jane!" she gasped, "it is Percy—my brother-in-law! He has described him exactly, even to his stick and his pocket-comb. But I thought he was in Chicago."

"If that is so," said Thorndyke, hastily repacking his case, "we had better start at once."

"We have the dogcart in the road," said Mrs. Hanshaw.

"Thank you," replied Thorndyke. "We will ride on our bicycles, and the inspector can borrow Willett's. We go out at the back by the cart-track, which joins the road farther on."

"Then we will follow in the dogcart," said Mrs. Haldean. "Come, Jane."

The two ladies departed down the path, while we made ready our bicycles and lit our lamps.

"With your permission, inspector," said Thorndyke, "we will take the key with us."

"It's hardly legal, sir," objected the officer. "We have no authority."

"It is quite illegal," answered Thorndyke; "but it is necessary; and necessity—like your military J.P.—knows no law."

The inspector grinned and went out, regarding me with a quivering eyelid as Thorndyke locked the door with his skeleton key. As we turned into the road, I saw the light of the dogcart behind us, and we pushed forward at a swift pace, picking up the trail easily on the soft, moist road.

"What beats me," said the inspector confidentially, as we rode along, "is how he knew the man was bald. Was it the footprints or the latchkey? And that comb, too, that was a regular knock-out."

These points were, by now, pretty clear to me. I had seen the hairs with their atrophied bulbs—such as one finds at the margin of a bald patch; and the comb was used, evidently, for the double purpose of keeping the bald patch covered and blackening the sulphur-charged hair. But the knobbed stick and the artificial limb puzzled me so completely that I presently overtook Thorndyke to demand an explanation.

"The stick," said he, "is perfectly simple. The ferrule of a knobbed stick wears evenly all round; that of a crooked stick wears on one side—the side opposite the crook. The impressions showed that the ferrule of this one was evenly convex;
This explanation, like the others, was quite simple when one had heard it, though it gave me material for much thought as we pedalled along the dark road, with Thorndyke’s light flickering in front, and the dogcart pattering in our wake. But there was ample time for reflection; for our pace rather precluded conversation, and we rode on, mile after mile, until my legs ached with fatigue. On and on we went through village after village, now losing the trail in some frequented street, but picking it up again unfailingly as we emerged on to the country road, until at last, in the paved High Street of the little town of Horsefield, we lost it for good. We rode on through the town out on to the country road; but although there were several tracks of motors, Thorndyke shook his head at them all. “I have been studying those tyres until I know them by heart,” he said. “No; either he is in the town, or he has left it by a side road.”

There was nothing for it but to put up the horse and the machines at the hotel, while we walked round to reconnoitre; and this we did, tramping up one street and down another, with eyes bent on the ground, fruitlessly searching for a trace of the missing car.

Suddenly, at the door of a blacksmith’s shop, Thorndyke halted. The shop had been kept open late for the shoeing of a carriage horse, which was just being led away, and the smith had come to the door for a breath of air. Thorndyke accosted him genially.

“Good-evening. You are just the man I wanted to see. I have mislaid the address of a friend of mine, who, I think, called on you this afternoon—a lame gentleman who walks with a stick. I expect he wanted you to pick a lock or make him a key.”

“Oh, I remember him!” said the man. “Yes, he had lost his latchkey, and wanted the lock picked before he could get into his house. Had to leave his motor-car outside while he came here. But I took some keys round with me, and fitted one to his latch.”

He then directed us to a house at the end of a street close by, and, having thanked him, we went off in high spirits.

“How did you know he had been there?” I asked.

“I didn’t; but there was the mark of a stick and part of a left foot on the soft earth inside the doorway, and the thing was inherently probable, so I risked a false shot.”

The house stood alone at the far end of a straggling street, and was enclosed by a high wall, in which, on the side facing the street, was a door and a wide carriage-gate. Advancing to the former, Thorndyke took from his pocket the purloined key, and tried it in the lock. It fitted perfectly, and when he had turned it and pushed open the door, we entered a small courtyard. Crossing this, we came to the front door of the house, the latch of which fortunately fitted the same key; and this having been opened by Thorndyke, we trooped into the hall. Immediately we heard the sound of an opening door above, and a reedy, nasal voice sang out:

“Hello, there! Who’s that below?”

The voice was followed by the appearance of a head projecting over the baluster rail.

“You are Mr. Percy Haldean, I think,” said the inspector.

At the mention of this name, the head was withdrawn, and a quick tread was heard, accompanied by the tapping of a stick on the floor. We started to ascend the stairs, the inspector leading, as the authorized official; but we had only gone up a few steps, when a fierce, wiry little man danced out on to the landing, with a thick stick in one hand and a very large revolver in the other.

“Move another step, either of you,” he shouted, pointing the weapon at the inspector, “and I let fly; and mind you, when I shoot I hit.”
He looked as if he meant it, and we accordingly halted with remarkable suddenness, while the inspector proceeded to parley.

“Now, what’s the good of this, Mr. Haldean?” said he. “The game’s up, and you know it.”

“You clear out of my house, and clear out sharp,” was the inhospitable rejoinder, “or you’ll give me the trouble of burying you in the garden.”

I looked round to consult with Thorndyke, when, to my amazement, I found that he had vanished—apparently through the open hall-door. I was admiring his discretion when the inspector endeavoured to reopen negotiations, but was cut short abruptly.

“I am going to count fifty,” said Mr. Haldean, “and if you aren’t gone then, I shall shoot.”

He began to count deliberately, and the inspector looked round at me in complete bewilderment. The flight of stairs was a long one, and well lighted by gas, so that to rush it was an impossibility. Suddenly my heart gave a bound and I held my breath, for out of an open door behind our quarry, a figure emerged slowly and noiselessly on to the landing. It was Thorndyke, shoeless, and in his shirt-sleeves.

Slowly and with cat-like stealthiness, he crept across the landing until he was within a yard of the unconscious fugitive,
and still the nasal voice droned on, monotonously counting out the allotted seconds.

“Forty-one, forty-two, forty-three—”

There was a lightning-like movement—a shout—a flash—a bang—a shower of falling plaster, and then the revolver came clattering down the stairs. The inspector and I rushed up, and in a moment the sharp click of the handcuffs told Mr. Percy Haldean that the game was really up.

*****

Five minutes later Freddy-boy, half asleep, but wholly cheerful, was borne on Thorndyke’s shoulders into the private sitting-room of the Black Horse Hotel. A shriek of joy saluted his entrance, and a shower of maternal kisses brought him to the verge of suffocation. Finally, the impulsive Mrs. Haldean, turning suddenly to Thorndyke, seized both his hands, and for a moment I hoped that she was going to kiss him, too. But he was spared, and I have not yet recovered from the disappointment.

III. — THE ANTHROPOLOGIST AT LARGE

THORNDYKE was not a newspaper reader. He viewed with extreme disfavour all scrappy and miscellaneous forms of literature, which, by presenting a disorderly series of unrelated items of information, tended, as he considered, to destroy the habit of consecutive mental effort.

“It is most important,” he once remarked to me, “habitually to pursue a definite train of thought, and to pursue it to a finish, instead of flitting indolently from one uncompleted topic to another, as the newspaper reader is so apt to do. Still, there is no harm in a daily paper—so long as you don’t read it.”

Accordingly, he patronized a morning paper, and his method of dealing with it was characteristic. The paper was laid on the table after breakfast, together with a blue pencil and a pair of office shears. A preliminary glance through the sheets enabled him to mark with the pencil those paragraphs that were to be read, and these were presently cut out and looked through, after which they were either thrown away or set aside to be pasted in an indexed book.

The whole proceeding occupied, on an average, a quarter of an hour.

On the morning of which I am now speaking he was thus engaged. The pencil had done its work, and the snick of the shears announced the final stage. Presently he paused with a newly-excised cutting between his fingers, and, after glancing at it for a moment, he handed it to me.

“Another art robbery,” he remarked. “Mysterious affairs, these—as to motive, I mean. You can’t melt down a picture or an ivory carving, and you can’t put them on the market as they stand. The very qualities that give them their value make them totally un negotiable.”

“Yet I suppose,” said I, “the really inveterate collector—the pottery or stamp maniac, for instance—will buy these contraband goods even though he dare not show them.”

“Probably. No doubt the cupiditas habendi, the mere desire to possess, is the motive force rather than any intelligent purpose—”

The discussion was at this point interrupted by a knock at the door, and a moment later my colleague admitted two gentlemen. One of these I recognized as a Mr. Marchmont, a solicitor, for whom we had occasionally acted; the other was a stranger—a typical Hebrew of the blonde type—good-looking, faultlessly dressed, carrying a bandbox, and obviously in a state of the most extreme agitation.

“Good-morning to you, gentlemen,” said Mr. Marchmont, shaking hands cordially. “I have brought a client of mine to see you, and when I tell you that his name is Solomon Löwe, it will be unnecessary for me to say what our business is.”

“Oddly enough,” replied Thorndyke, “we were, at the very moment when you knocked, discussing the bearings of his case.”

“It is a horrible affair!” burst in Mr. Löwe. “I am distracted! I am ruined! I am in despair!”

He banged the bandbox down on the table, and flinging himself into a chair, buried his face in his hands.

“Come, come,” remonstrated Marchmont, “we must be brave, we must be composed. Tell Dr. Thorndyke your story, and let us hear what he thinks of it.”

He leaned back in his chair, and looked at his client with that air of patient fortitude that comes to us all so easily when we contemplate the misfortunes of other people.

“You must help us, sir,” exclaimed Löwe, starting up again—“you must, indeed, or I shall go mad. But I shall tell you what has happened, and then you must act at once. Spare no effort and no expense. Money is no object—at least, not in reason,” he added, with native caution. He sat down once more, and in perfect English, though with a slight German accent, proceeded volubly: “My brother Isaac is probably known to you by name.”

Thorndyke nodded.
“He is a great collector, and to some extent a dealer—that is to say, he makes his hobby a profitable hobby.”

“What does he collect?” asked Thorndyke.

“Everything,” replied our visitor, flinging his hands apart with a comprehensive gesture—“everything that is precious and beautiful—pictures, ivories, jewels, watches, objects of art and vertu—everything. He is a Jew, and he has that passion for things that are rich and costly that has distinguished our race from the time of my namesake Solomon onwards. His house in Howard Street, Piccadilly, is at once a museum and an art gallery. The rooms are filled with cases of gems, of antique jewellery, of coins and historic relics—some of priceless value—and the walls are covered with paintings, every one of which is a masterpiece. There is a fine collection of ancient weapons and armour, both European and Oriental; rare books, manuscripts, papyri, and valuable antiquities from Egypt, Assyria, Cyprus, and elsewhere. You see, his taste is quite catholic, and his knowledge of rare and curious things is probably greater than that of any other living man. He is never mistaken. No forgery deceives him, and hence the great prices that he obtains; for a work of art purchased from Isaac Löwe is a work certified as genuine beyond all cavil.”

He paused to mop his face with a silk handkerchief, and then, with the same plaintive volubility, continued:

“My brother is unmarried. He lives for his collection, and he lives with it. The house is not a very large one, and the collection takes up most of it; but he keeps a suite of rooms for his own occupation, and has two servants—a man and wife—to look after him. The man, who is a retired police sergeant, acts as caretaker and watchman; the woman as housekeeper and cook, if required, but my brother lives largely at his club. And now I come to this present catastrophe.”

He ran his fingers through his hair, took a deep breath, and then, with the same plaintive volubility, continued:

“Yesterday morning Isaac started for Florence by way of Paris, but his route was not certain, and he intended to break his journey at various points as circumstances determined. Before leaving, he put his collection in my charge, and it was arranged that I should occupy his rooms in his absence. Accordingly, I sent my things round and took possession.

“Now, Dr. Thorndyke, I am closely connected with the drama, and it is my custom to spend my evenings at my club, of which most of the members are actors. Consequently, I am rather late in my habits; but last night I was earlier than usual in leaving my club, for I started for my brother’s house before half-past twelve. I felt, as you may suppose, the responsibility of the great charge I had undertaken; and you may, therefore, imagine my horror, my consternation, my despair, when, on letting myself in with my latchkey, I found a policeman-inspector, a sergeant, and a constable in the hall. There had been a robbery, sir, in my brief absence, and the account that the inspector gave of the affair was briefly this:

“While taking the round of his district, he had noticed an empty hansom proceeding in leisurely fashion along Howard Street. There was nothing remarkable in this, but when, about ten minutes later, he was returning, and met a hansom, which he believed to be the same, proceeding along the same street in the same direction, and at the same easy pace, the circumstance struck him as odd, and he made a note of the number of the cab in his pocket-book. It was 72,863, and the time was 11.35.

“At 11.45 a constable coming up Howard Street noticed a hansom standing opposite the door of my brother’s house, and, while he was looking at it, a man came out of the house carrying something, which he put in the cab. On this the constable quickened his pace, and when the man returned to the house and reappeared carrying what looked like a portmanteau, and closing the door softly behind him, the policeman’s suspicions were aroused, and he hurried forward, hauling the cabman to stop.

“The man put his burden into the cab, and sprang in himself. The cabman lashed his horse, which started off at a gallop, and the policeman broke into a run, blowing his whistle and flashing his lantern on to the cab. He followed it round the two turnings into Albemarle Street, and was just in time to see it turn into Piccadilly, where, of course, it was lost. However, he managed to note the number of the cab, which was 72,863, and he describes the man as short and thick-set, and thinks he was not wearing any hat.

“As he was returning, he met the inspector and the sergeant, who had heard the whistle, and on his report the three officers hurried to the house, where they knocked and rang for some minutes without any result. Being now more than suspicious, they went to the back of the house, through the mews, where, with great difficulty, they managed to force a window and effect an entrance into the house.

“Here their suspicions were soon changed to certainty, for, on reaching the first-floor, they heard strange muffled groans proceeding from one of the rooms, the door of which was locked, though the key had not been removed. They opened the door, and found the caretaker and his wife sitting on the floor, with their backs against the wall. Both were bound hand and foot, and the head of each was enveloped in a green-baize bag; and when the bags were taken off, each was found to be lightly but effectually gagged.

“Each told the same story. The caretaker, fancying he heard a noise, armed himself with a truncheon, and came downstairs to the first-floor, where he found the door of one of the rooms open, and a light burning inside. He stepped on tiptoe to the open door, and was peering in, when he was seized from behind, half suffocated by a pad held over his mouth, pinioned, gagged, and blindfolded with the bag.

“His assailant—whom he never saw—was amazingly strong and skilful, and handled him with perfect ease, although he—the caretaker—is a powerful man, and a good boxer and wrestler. The same thing happened to the wife, who had come down to look for her husband. She walked into the same trap, and was gagged, pinioned, and blindfolded without ever
having seen the robber. So the only description that we have of this villain is that furnished by the constable."

"And the caretaker had no chance of using his truncheon?" said Thorndyke.

"Well, he got in one backhanded blow over his right shoulder, which he thinks caught the burglar in the face; but the fellow caught him by the elbow, and gave his arm such a twist that he dropped the truncheon on the floor."

"Is the robbery a very extensive one?"

"Ah!" exclaimed Mr. Löwe, "that is just what we cannot say. But I fear it is. It seems that my brother had quite recently drawn out of his bank four thousand pounds in notes and gold. These little transactions are often carried out in cash rather than by cheque"—here I caught a twinkle in Thorndyke’s eye—"and the caretaker says that a few days ago Isaac brought home several parcels, which were put away temporarily in a strong cupboard. He seemed to be very pleased with his new acquisitions, and gave the caretaker to understand that they were of extraordinary rarity and value.

"Now, this cupboard has been cleared out. Not a vestige is left in it but the wrappings of the parcels, so, although nothing else has been touched, it is pretty clear that goods to the value of four thousand pounds have been taken; but when we consider what an excellent buyer my brother is, it becomes highly probable that the actual value of those things is two or three times that amount, or even more. It is a dreadful, dreadful business, and Isaac will hold me responsible for it all."

"Is there no further clue?" asked Thorndyke. "What about the cab, for instance?"

"Oh, the cab," groaned Löwe—"that clue failed. The police must have mistaken the number. They telephoned immediately to all the police stations, and a watch was set, with the result that number 72,863 was stopped as it was going home for the night. But it then turned out that the cab had not been off the rank since eleven o’clock, and the driver had been in the shelter all the time with several other men. But there is a clue; I have it here."

Mr. Löwe’s face brightened for once as he reached out for the bandbox.

"The houses in Howard Street," he explained, as he untied the fastening, "have small balconies to the first-floor windows at the back. Now, the thief entered by one of these windows, having climbed up a rain-water pipe to the balcony. It was a gusty night, as you will remember, and this morning, as I was leaving the house, the butler next door called to me and gave me this; he had found it lying in the balcony of his house."

He opened the bandbox with a flourish, and brought forth a rather shabby billycock hat.

"I understand," said he, "that by examining a hat it is possible to deduce from it, not only the bodily characteristics of the wearer, but also his mental and moral qualities, his state of health, his pecuniary position, his past history, and even his domestic relations and the peculiarities of his place of abode. Am I right in this supposition?"

The ghost of a smile flitted across Thorndyke’s face as he laid the hat upon the remains of the newspaper. "We must not expect too much," he observed. "Hats, as you know, have a way of changing owners. Your own hat, for instance" (a very spruce, hard felt), "is a new one, I think."

"Got it last week," said Mr. Löwe.

"Exactly. It is an expensive hat, by Lincoln and Bennett, and I see you have judiciously written your name in indelible marking-ink on the lining. Now, a new hat suggests a discarded predecessor. What do you do with your old hats?"

"My man has them, but they don’t fit him. I suppose he sells them or gives them away."

"Very well. Now, a good hat like yours has a long life, and remains serviceable long after it has become shabby; and the probability is that many of your hats pass from owner to owner; from you to the shabby-genteel, and from them to the shabby ungentee. And it is a fair assumption that there are, at this moment, an appreciable number of tramps and casuals wearing hats by Lincoln and Bennett, marked in indelible ink with the name S. Löwe; and anyone who should examine those hats, as you suggest, might draw some very misleading deductions as to the personal habits of S. Löwe."

Mr. Marchmont chuckled audibly, and then, remembering the gravity of the occasion, suddenly became portentously solemn.

"So you think that the hat is of no use, after all?" said Mr. Löwe, in a tone of deep disappointment.

"I won’t say that," replied Thorndyke. "We may learn something from it. Leave it with me, at any rate; but you must let the police know that I have it. They will want to see it, of course."

"And you will try to get those things, won’t you?" pleaded Löwe.

"I will think over the case. But you understand, or Mr. Marchmont does, that this is hardly in my province. I am a medical jurist, and this is not a medico-legal case."

"Just what I told him," said Marchmont. "But you will do me a great kindness if you will look into the matter. Make it a medico-legal case," he added persuasively.

Thorndyke repeated his promise, and the two men took their departure.

For some time after they had left, my colleague remained silent, regarding the hat with a quizzical smile. "It is like a game of forfeits," he remarked at length, "and we have to find the owner of this very pretty thing." He lifted it with a pair of forceps into a better light, and began to look at it more closely.
“Perhaps,” said he, “we have done Mr. Löwe an injustice, after all. This is certainly a very remarkable hat.”

“It is as round as a basin,” I exclaimed. “Why, the fellow’s head must have been turned in a lathe!”

Thorndyke laughed. “The point,” said he, “is this. This is a hard hat, and so must have fitted fairly, or it could not have been worn; and it was a cheap hat, and so was not made to measure. But a man with a head that shape has got to come to a clear understanding with his hat. No ordinary hat would go on at all.

“Now, you see what he has done—no doubt on the advice of some friendly hatter. He has bought a hat of a suitable size, and he has made it hot—probably steamed it. Then he has jammed it, while still hot and soft, on to his head, and allowed it to cool and set before removing it. That is evident from the distortion of the brim. The important corollary is, that this hat fits his head exactly—is, in fact, a perfect mould of it; and this fact, together with the cheap quality of the hat, furnishes the further corollary that it has probably only had a single owner.

“And now let us turn it over and look at the outside. You notice at once the absence of old dust. Allowing for the circumstance that it had been out all night, it is decidedly clean. Its owner has been in the habit of brushing it, and is therefore presumably a decent, orderly man. But if you look at it in a good light, you see a kind of bloom on the felt, and through this lens you can make out particles of a fine white powder which has worked into the surface.”

He handed me his lens, through which I could distinctly see the particles to which he referred.

“Then,” he continued, “under the curl of the brim and in the folds of the hatband, where the brush has not been able to reach it, the powder has collected quite thickly, and we can see that it is a very fine powder, and very white, like flour. What do you make of that?”

“I should say that it is connected with some industry. He may be engaged in some factory or works, or; at any rate, may live near a factory, and have to pass it frequently.”

“Yes; and I think we can distinguish between the two possibilities. For, if he only passed the factory, the dust will be on the outside of the hat only; the inside will be protected by his head. But if he is engaged in the works, the dust will be inside, too, as the hat will hang on a peg in the dust-laden atmosphere, and his head will also be powdered, and so convey the dust to the inside.”

He turned the hat over once more, and as I brought the powerful lens to bear upon the dark lining, I could clearly distinguish a number of white particles in the interstices of the fabric.

“The powder is on the inside, too,” I said.

He took the lens from me, and, having verified my statement, proceeded with the examination. “You notice,” he said, “that the leather head-lining is stained with grease, and this staining is more pronounced at the sides and back. His hair, therefore, is naturally greasy, or he greases it artificially; for if the staining were caused by perspiration, it would be most marked opposite the forehead.”

He peered anxiously into the interior of the hat, and eventually turned down the head-lining; and immediately there broke out upon his face a gleam of satisfaction.

“Ha!” he exclaimed. “This is a stroke of luck. I was afraid our neat and orderly friend had defeated us with his brush. Pass me the small dissecting forceps, Jervis.”

I handed him the instrument, and he proceeded to pick out daintily from the space behind the head-lining some half a dozen short pieces of hair, which he laid, with infinite tenderness, on a sheet of white paper.

“There are several more on the other side,” I said, pointing them out to him.

“Yes, but we must leave some for the police,” he answered, with a smile. “They must have the same chance as ourselves, you know.”

“But surely,” I said, as I bent down over the paper, “these are pieces of horsehair!”

“I think not,” he replied; “but the microscope will show. At any rate, this is the kind of hair I should expect to find with a head of that shape.”

“Well, it is extraordinarily coarse,” said I, “and two of the hairs are nearly white.”

“Yes; black hairs beginning to turn grey. And now, as our preliminary survey has given such encouraging results, we will proceed to more exact methods; and we must waste no time, for we shall have the police here presently to rob us of our treasure.”

He folded up carefully the paper containing the hairs, and taking the hat in both hands, as though it were some sacred vessel, ascended with me to the laboratory on the next floor.

“Now, Polton,” he said to his laboratory assistant, “we have here a specimen for examination, and time is precious. First of all, we want your patent dust-extractor.”

The little man bustled to a cupboard and brought forth a singular appliance, of his own manufacture, somewhat like a miniature vacuum cleaner. It had been made from a bicycle foot-pump, by reversing the piston-valve, and was fitted with a glass nozzle and a small detachable glass receiver for collecting the dust, at the end of a flexible metal tube.
We will sample the dust from the outside first,” said Thorndyke, laying the hat upon the work-bench. “Are you ready, Polton?”

The assistant slipped his foot into the stirrup of the pump and worked the handle vigorously, while Thorndyke drew the glass nozzle slowly along the hat-brim under the curled edge. And as the nozzle passed along, the white coating vanished as if by magic, leaving the felt absolutely clean and black, and simultaneously the glass receiver became clouded over with a white deposit.

“We will leave the other side for the police,” said Thorndyke, and as Polton ceased pumping he detached the receiver, and laid it on a sheet of paper, on which he wrote in pencil, “Outside,” and covered it with a small bell-glass. A fresh receiver having been fitted on, the nozzle was now drawn over the silk lining of the hat, and then through the space behind the leather head-lining on one side; and now the dust that collected in the receiver was much of the usual grey colour and fluffy texture, and included two more hairs.

“And now,” said Thorndyke, when the second receiver had been detached and set aside, “we want a mould of the inside of the hat, and we must make it by the quickest method; there is no time to make a paper mould. It is a most astonishing head,” he added, reaching down from a nail a pair of large callipers, which he applied to the inside of the hat; “six inches and nine-tenths long by six and six-tenths broad, which gives us”—he made a rapid calculation on a scrap of paper—“the extraordinarily high cephalic index of 95·6.”

Polton now took possession of the hat, and, having stuck a band of wet tissue-paper round the inside, mixed a small bowl of plaster-of-Paris, and very dexterously ran a stream of the thick liquid on to the tissue-paper, where it quickly solidified. A second and third application resulted in a broad ring of solid plaster an inch thick, forming a perfect mould of the inside of the hat, and in a few minutes the slight contraction of the plaster in setting rendered the mould sufficiently loose to allow of its being slipped out on to a board to dry.

We were none too soon, for even as Polton was removing the mould, the electric bell, which I had switched on to the laboratory, announced a visitor, and when I went down I found a police-sergeant waiting with a note from Superintendent Miller, requesting the immediate transfer of the hat.

“The next thing to be done,” said Thorndyke, when the sergeant had departed with the bandbox, “is to measure the thickness of the hairs, and make a transverse section of one, and examine the dust. The section we will leave to Polton—as time is an object, Polton, you had better imbed the hair in thick gum and freeze it hard on the microtome, and be very careful to cut the section at right angles to the length of the hair—meanwhile, we will get to work with the microscope.”

The hairs proved on measurement to have the surprisingly large diameter of 1/135 of an inch—fully double that of ordinary hairs, although they were unquestionably human. As to the white dust, it presented a problem that even Thorndyke was unable to solve. The application of reagents showed it to be carbonate of lime, but its source for a time remained a mystery.

“The larger particles,” said Thorndyke, with his eye applied to the microscope, “appear to be transparent, crystalline, and distinctly laminated in structure. It is not chalk, it is not whiting, it is not any kind of cement. What can it be?”

“Could it be any kind of shell?” I suggested. “For instance—”

“Of course!” he exclaimed, starting up; “you have hit it, Jervis, as you always do. It must be mother-of-pearl. Polton, give me a pearl shirt-button out of your oddments box.”

The button was duly produced by the thrifty Polton, dropped into an agate mortar, and speedily reduced to powder, a tiny pinch of which Thorndyke placed under the microscope.

“This powder,” said he, “is, naturally, much coarser than our specimen, but the identity of character is unmistakable. Jervis, you are a treasure. Just look at it.”

I glanced down the microscope, and then pulled out my watch. “Yes,” I said, “there is no doubt about it, I think; but I must be off. Anstey urged me to be in court by 11.30 at the latest.”

With infinite reluctance I collected my notes and papers and departed, leaving Thorndyke diligently copying addresses out of the Post Office Directory.

My business at the court detained me the whole of the day, and it was near upon dinner-time when I reached our chambers. Thorndyke had not yet come in, but he arrived half an hour later, tired and hungry, and not very communicative.

“What have I done?” he repeated, in answer to my inquiries. “I have walked miles of dirty pavement, and I have visited every pearl-shell cutter’s in London, with one exception, and I have not found what I was looking for. The one mother-of-pearl factory that remains, however, is the most likely, and I propose to look in there to-morrow morning. Meanwhile, we have completed our data, with Polton’s assistance. Here is a tracing of our friend’s skull taken from the mould; you see it is an extreme type of brachycephalic skull, and markedly unsymmetrical. Here is a transverse section of his hair, which is quite circular—unlike yours or mine, which would be oval. We have the mother-of-pearl dust from the outside of the hat, and from the inside similar dust mixed with various fibres and a few granules of rice starch. Those are our data.”
“Supposing the hat should not be that of the burglar after all?” I suggested.

“That would be annoying. But I think it is his, and I think I can guess at the nature of the art treasures that were stolen.”

“And you don’t intend to enlighten me?”

“My dear fellow,” he replied, “you have all the data. Enlighten yourself by the exercise of your own brilliant faculties. Don’t give way to mental indolence.”

I endeavoured, from the facts in my possession, to construct the personality of the mysterious burglar, and failed utterly; nor was I more successful in my endeavour to guess at the nature of the stolen property; and it was not until the following morning, when we had set out on our quest and were approaching Limehouse, that Thorndyke would revert to the subject.

“We are now,” he said, “going to the factory of Badcomb and Martin, shell importers and cutters, in the West India Dock Road. If I don’t find my man there, I shall hand the facts over to the police, and waste no more time over the case.”

“What is your man like?” I asked.

“I am looking for an elderly Japanese, wearing a new hat or, more probably, a cap, and having a bruise on his right cheek or temple. I am also looking for a cab-yard; but here we are at the works, and as it is now close on the dinner-hour, we will wait and see the hands come out before making any inquiries.”

We walked slowly past the tall, blank-faced building, and were just turning to re-pass it when a steam whistle sounded, a wicket opened in the main gate, and a stream of workmen—each powdered with white, like a miller—emerged into the street. We halted to watch the men as they came out, one by one, through the wicket, and turned to the right or left towards their homes or some adjacent coffee-shop; but none of them answered to the description that my friend had given.

The outcoming stream grew thinner, and at length ceased; the wicket was shut with a bang, and once more Thorndyke’s quest appeared to have failed.

“Is that all of them, I wonder?” he said, with a shade of disappointment in his tone; but even as he spoke the wicket opened again, and a leg protruded. The leg was followed by a back and a curious globular head, covered with iron-grey hair, and surmounted by a cloth cap, the whole appertaining to a short, very thick-set man, who remained thus, evidently talking to someone inside.

Suddenly he turned his head to look across the street; and immediately I recognized, by the pallid yellow complexion and narrow eye-slits, the physiognomy of a typical Japanese. The man remained talking for nearly another minute; then, drawing out his other leg, he turned towards us; and now I perceived that the right side of his face, over the prominent cheekbone, was discoloured as though by a severe bruise.

“Ha!” said Thorndyke, turning round sharply as the man approached, “either this is our man or it is an incredible coincidence.” He walked away at a moderate pace, allowing the Japanese to overtake us slowly, and when the man had at length passed us, he increased his speed somewhat, so as to maintain the distance.

Our friend stepped along briskly, and presently turned up a side street, whither we followed at a respectful distance, Thorndyke holding open his pocket-book, and appearing to engage me in an earnest discussion, but keeping a sharp eye on his quarry.

“There he goes!” said my colleague, as the man suddenly disappeared—“the house with the green window-sashes. That
will be number thirteen.”

It was; and, having verified the fact, we passed on, and took the next turning that would lead us back to the main road.

Some twenty minutes later, as we were strolling past the door of a coffee-shop, a man came out, and began to fill his pipe with an air of leisurely satisfaction. His hat and clothes were powdered with white like those of the workmen whom we had seen come out of the factory. Thorndyke accosted him.

“Is that a flour-mill up the road there?”

“No, sir; pearl-shell. I work there myself.”

“Pearl-shell, eh?” said Thorndyke. “I suppose that will be an industry that will tend to attract the aliens. Do you find it so?”

“No, sir; not at all. The work’s too hard. We’ve only got one foreigner in the place, and he ain’t an alien—he’s a Jap.”

“A Jap!” exclaimed Thorndyke. “Really. Now, I wonder if that would chance to be our old friend Kotei—you remember Kotei?” he added, turning to me.

“No, sir; this man’s name is Futashima. There was another Jap in the works, a chap named Itu, a pal of Futashima’s, but he’s left.”

“Ah! I don’t know either of them. By the way, usen’t there to be a cab-yard just about here?”

“There’s a yard up Rankin Street where they keep vans and one or two cabs. That chap Itu works there now. Taken to horseflesh. Drives a van sometimes. Queer start for a Jap.”

“Very.” Thorndyke thanked the man for his information, and we sauntered on towards Rankin Street. The yard was at this time nearly deserted, being occupied only by an ancient and crazy four-wheeler and a very shabby hansom.

“Curious old houses, these that back on to the yard,” said Thorndyke, strolling into the enclosure. “That timber gable, now,” pointing to a house, from a window of which a man was watching us suspiciously, “is quite an interesting survival.”

“What’s your business, mister?” demanded the man in a gruff tone.

“We are just having a look at these quaint old houses,” replied Thorndyke, edging towards the back of the hansom, and opening his pocket-book, as though to make a sketch.

“Well, you can see ’em from outside,” said the man.
“So we can,” said Thorndyke suavely, “but not so well, you know.”

At this moment the pocket-book slipped from his hand and fell, scattering a number of loose papers about the ground under the hansom, and our friend at the window laughed joyously.

“No hurry,” murmured Thorndyke, as I stooped to help him to gather up the papers—which he did in the most surprisingly slow and clumsy manner. “It is fortunate that the ground is dry.” He stood up with the rescued papers in his hand, and, having scribbled down a brief note, slipped the book in his pocket.

“Now you’d better muzzle,” observed the man at the window.

“Thank you,” replied Thorndyke, “I think we had;” and, with a pleasant nod at the custodian, he proceeded to adopt the hospitable suggestion.

*****

“Mr. Marchmont has been here, sir, with Inspector Badger and another gentleman,” said Polton, as we entered our chambers. “They said they would call again about five.”

“Then,” replied Thorndyke, “as it is now a quarter to five, there is just time for us to have a wash while you get the tea ready. The particles that float in the atmosphere of Limehouse are not all mother-of-pearl.”
Our visitors arrived punctually, the third gentleman being, as we had supposed, Mr. Solomon Löwe. Inspector Badger I had not seen before, and he now impressed me as showing a tendency to invert the significance of his own name by endeavouring to “draw” Thorndyke; in which, however, he was not brilliantly successful.

“I hope you are not going to disappoint Mr. Löwe, sir,” he commenced facetiously. “You have had a good look at that hat—we saw your marks on it—and he expects that you will be able to point us out the man, name and address all complete.” He grinned patronizingly at our unfortunate client, who was looking even more haggard and worn than he had been on the previous morning.

“Have you—have you made any—discovery?” Mr Löwe asked with pathetic eagerness.

“We examined the hat very carefully, and I think we have established a few facts of some interest.”

“Did your examination of the hat furnish any information as to the nature of the stolen property, sir?” inquired the humorous inspector.

Thorndyke turned to the officer with a face as expressionless as a wooden mask.

“We thought it possible,” said he, “that it might consist of works of Japanese art, such as netsukes, paintings, and such like.”

Mr. Löwe uttered an exclamation of delighted astonishment, and the facetiousness faded rather suddenly from the inspector’s countenance.

“I don’t know how you can have found out,” said he. “We have only known it half an hour ourselves, and the wire came direct from Florence to Scotland Yard.”

“Perhaps you can describe the thief to us,” said Mr. Löwe, in the same eager tone.

“I dare say the inspector can do that,” replied Thorndyke.

“Yes, I think so,” replied the officer. “He is a short strong man, with a dark complexion and hair turning grey. He has a very round head, and he is probably a workman engaged at some whiting or cement works. That is all we know; if you can tell us any more, sir, we shall be very glad to hear it.”

“I can only offer a few suggestions,” said Thorndyke, “but perhaps you may find them useful. For instance, at 13, Birket Street, Limehouse, there is living a Japanese gentleman named Futashima, who works at Badcomb and Martin’s mother-of-pearl factory. I think that if you were to call on him, and let him try on the hat that you have, it would probably fit him.”

The inspector scribbled ravenously in his notebook, and Mr. Marchmont—an old admirer of Thorndyke’s—leaned back in his chair, chuckling softly and rubbing his hands.

“Then,” continued my colleague, “there is in Rankin Street, Limehouse, a cab-yard, where another Japanese gentleman named Itu is employed. You might find out where Itu was the night before last; and if you should chance to see a hansom cab there—number 22,481—have a good look at it. In the frame of the number-plate you will find six small holes. Those holes may have held brads, and the brads may have held a false number card. At any rate, you might ascertain where that cab was at 11.30 the night before last. That is all I have to suggest.”

Mr. Löwe leaped from his chair. “Let us go—now—at once—there is no time to be lost. A thousand thanks to you, doctor—a thousand million thanks. Come!”

He seized the inspector by the arm and forcibly dragged him towards the door, and a few moments later we heard the footsteps of our visitors clattering down the stairs.

“It was not worth while to enter into explanations with them,” said Thorndyke, as the footsteps died away—“nor perhaps with you?”

“On the contrary,” I replied, “I am waiting to be fully enlightened.”

“Well, then, my inferences in this case were perfectly simple ones, drawn from well-known anthropological facts. The human race, as you know, is roughly divided into three groups—the black, the white, and the yellow races. But apart from the variable quality of colour, these races have certain fixed characteristics associated especially with the shape of the skull, of the eye-sockets, and the hair.

“Thus in the black races the skull is long and narrow, the eye-sockets are long and narrow, and the hair is flat and ribbon-like, and usually coiled up like a watch-spring. In the white races the skull is oval, the eye-sockets are oval, and the hair is slightly flattened or oval in section, and tends to be wavy; while in the yellow or Mongol races, the skull is short and round, the eye-sockets are short and round, and the hair is straight and circular in section. So that we have, in the black races, long skull, long orbits, flat hair; in the white races, oval skull, oval orbits, oval hair; and in the yellow races, round skull, round orbits, round hair.

“Now, in this case we had to deal with a very short round skull. But you cannot argue from races to individuals; there are many short-skulled Englishmen. But when I found, associated with that skull, hairs which were circular in section, it became practically certain that the individual was a Mongol of some kind. The mother-of-pearl dust and the granules of rice starch from the inside of the hat favoured this view, for the pearl-shell industry is specially connected with China and Japan, while starch granules from the hat of an Englishman would probably be wheat starch.
“Then as to the hair: it was, as I mentioned to you, circular in section, and of very large diameter. Now, I have examined many thousands of hairs, and the thickest that I have ever seen came from the heads of Japanese; but the hairs from this hat were as thick as any of them. But the hypothesis that the burglar was a Japanese received confirmation in various ways. Thus, he was short, though strong and active, and the Japanese are the shortest of the Mongol races, and very strong and active.

Then his remarkable skill in handling the powerful caretaker—a retired police-sergeant—suggested the Japanese art of ju-jitsu, while the nature of the robbery was consistent with the value set by the Japanese on works of art. Finally, the fact that only a particular collection was taken, suggested a special, and probably national, character in the things stolen, while their portability—you will remember that goods of the value of from eight to twelve thousand pounds were taken away in two hand-packages—was much more consistent with Japanese than Chinese works, of which the latter tend rather to be bulky and ponderous. Still, it was nothing but a bare hypothesis until we had seen Futashima—and, indeed, is no more now. I may, after all, be entirely mistaken.”

He was not, however; and at this moment there reposes in my drawing-room an ancient netsuke, which came as a thank-offering from Mr. Isaac Löwe on the recovery of the booty from a back room in No. 13, Birket Street, Limehouse. The treasure, of course, was given in the first place to Thorndyke, but transferred by him to my wife on the pretence that but for my suggestion of shell-dust the robber would never have been traced. Which is, on the face of it, preposterous.
IV. — THE BLUE SEQUIN

First published in Pearson's Magazine, December 1908

THORNDYKE stood looking up and down the platform with anxiety that increased as the time drew near for the departure of the train.

“This is very unfortunate,” he said, reluctantly stepping into an empty smoking compartment as the guard executed a flourish with his green flag. “I am afraid we have missed our friend.” He closed the door, and, as the train began to move, thrust his head out of the window.

“Now I wonder if that will be he,” he continued. “If so, he has caught the train by the skin of his teeth, and is now in one of the rear compartments.”

The subject of Thorndyke’s speculations was Mr. Edward Stopford, of the firm of Stopford and Myers, of Portugal Street, solicitors, and his connection with us at present arose out of a telegram that had reached our chambers on the preceding evening. It was reply-paid, and ran thus:

“Can you come here to-morrow to direct defence? Important case. All costs undertaken by us.—STOPFORD AND MYERS.”

Thorndyke’s reply had been in the affirmative, and early on this present morning a further telegram—evidently posted overnight—had been delivered:

“Shall leave for Woldhurst by 8.25 from Charing Cross. Will call for you if possible.—EDWARD STOPFORD.”

He had not called, however, and, since he was unknown personally to us both, we could not judge whether or not he had been among the passengers on the platform.

“It is most unfortunate,” Thorndyke repeated, “for it deprives us of that preliminary consideration of the case which is so invaluable.” He filled his pipe thoughtfully, and, having made a fruitless inspection of the platform at London Bridge, took up the paper that he had bought at the bookstall, and began to turn over the leaves, running his eye quickly down the columns, unmindful of the journalistic baits in paragraph or article.

“It is a great disadvantage,” he observed, while still glancing through the paper, “to come plump into an inquiry without preparation—to be confronted with the details before one has a chance of considering the case in general terms. For instance—”

He paused, leaving the sentence unfinished, and as I looked up inquiringly I saw that he had turned over another page, and was now reading attentively.

“This looks like our case, Jervis,” he said presently, handing me the paper and indicating a paragraph at the top of the page. It was quite brief, and was headed “Terrible Murder in Kent,” the account being as follows:

“A shocking crime was discovered yesterday morning at the little town of Woldhurst, which lies on the branch line from Halbury Junction. The discovery was made by a porter who was inspecting the carriages of the train which had just come in. On opening the door of a first-class compartment, he was horrified to find the body of a fashionably-dressed woman stretched upon the floor. Medical aid was immediately summoned, and on the arrival of the divisional surgeon, Dr. Morton, it was ascertained that the woman had not been dead more than a few minutes.
"The state of the corpse leaves no doubt that a murder of a most brutal kind has been perpetrated, the cause of death being a penetrating wound of the head, inflicted with some pointed implement, which must have been used with terrible violence, since it has perforated the skull and entered the brain. That robbery was not the motive of the crime is made clear by the fact that an expensively fitted dressing-bag was found on the rack, and that the dead woman's jewellery, including several valuable diamond rings, was untouched. It is rumoured that an arrest has been made by the local police."

"A gruesome affair," I remarked, as I handed back the paper, "but the report does not give us much information."

"It does not," Thorndyke agreed, "and yet it gives us something to consider. Here is a perforating wound of the skull, inflicted with some pointed implement—that is, assuming that it is not a bullet wound. Now, what kind of implement would be capable of inflicting such an injury? How would such an implement be used in the confined space of a railway-carriage, and what sort of person would be in possession of such an implement? These are preliminary questions that are worth considering, and I commend them to you, together with the further problems of the possible motive—excluding robbery—and any circumstances other than murder which might account for the injury."

"The choice of suitable implements is not very great," I observed.

"It is very limited, and most of them, such as a plasterer's pick or a geological hammer, are associated with certain definite occupations. You have a notebook?"
I had, and, accepting the hint, I produced it and pursued my further reflections in silence, while my companion, with his notebook also on his knee, gazed steadily out of the window. And thus he remained, wrapped in thought, jotting down an entry now and again in his book, until the train slowed down at Halbury Junction, where we had to change on to a branch line.

As we stepped out, I noticed a well-dressed man hurrying up the platform from the rear and eagerly scanning the faces of the few passengers who had alighted. Soon he espied us, and, approaching quickly, asked, as he looked from one of us to the other:

“Dr. Thorndyke?”

“Yes,” replied my colleague, adding: “And you, I presume, are Mr. Edward Stopford?”

The solicitor bowed. “This is a dreadful affair,” he said, in an agitated manner. “I see you have the paper. A most shocking affair. I am immensely relieved to find you here. Nearly missed the train, and feared I should miss you.”

“There appears to have been an arrest,” Thorndyke began.

“Yes—my brother. Terrible business. Let us walk up the platform; our train won’t start for a quarter of an hour yet.”

We deposited our joint Gladstone and Thorndyke’s travelling-case in an empty first-class compartment, and then, with the solicitor between us, strolled up to the unfrequented end of the platform.

“My brother’s position,” said Mr. Stopford, “fills me with dismay—but let me give you the facts in order, and you shall judge for yourself. This poor creature who has been murdered so brutally was a Miss Edith Grant. She was formerly an artist’s model, and as such was a good deal employed by my brother, who is a painter—Harold Stopford, you know, A.R.A. now—”

“I know his work very well, and charming work it is.”

“I think so, too. Well, in those days he was quite a youngster—about twenty—and he became very intimate with Miss Grant, in quite an innocent way, though not very discreet; but she was a nice respectable girl, as most English models are, and no one thought any harm. However, a good many letters passed between them, and some little presents, amongst which was a beaded chain carrying a locket, and in this he was fool enough to put his portrait and the inscription, ’Edith, from Harold.’

“Later on Miss Grant, who had a rather good voice, went on the stage, in the comic opera line, and, in consequence, her habits and associates changed somewhat; and, as Harold had meanwhile become engaged, he was naturally anxious to get his letters back, and especially to exchange the locket for some less compromising gift. The letters she eventually sent him, but refused absolutely to part with the locket.

“Now, for the last month Harold has been staying at Halbury, making sketching excursions into the surrounding country, and yesterday morning he took the train to Shinglehurst, the third station from here, and the one before Woldhurst.

“On the platform here he met Miss Grant, who had come down from London, and was going on to Worthing. They entered the branch train together, having a first-class compartment to themselves. It seems she was wearing his locket at the time, and he made another appeal to her to make an exchange, which she refused, as before. The discussion appears to have become rather heated and angry on both sides, for the guard and a porter at Munsden both noticed that they seemed to be quarrelling; but the upshot of the affair was that the lady snapped the chain, and tossed it together with the locket to my brother, and they parted quite amiably at Shinglehurst, where Harold got out. He was then carrying his full sketching kit, including a large holland umbrella, the lower joint of which is an ash staff fitted with a powerful steel spike for driving into the ground.

“It was about half-past ten when he got out at Shinglehurst; by eleven he had reached his pitch and got to work, and he painted steadily for three hours. Then he packed up his traps, and was just starting on his way back to the station, when he was met by the police and arrested.

“And now, observe the accumulation of circumstantial evidence against him. He was the last person seen in company with the murdered woman—for no one seems to have seen her after they left Munsden; he appeared to be quarrelling with her when she was last seen alive, he had a reason for possibly wishing for her death, he was provided with an implement—a spiked staff—capable of inflicting the injury which caused her death, and, when he was searched, there was found in his possession the locket and broken chain, apparently removed from her person with violence.

“Against all this is, of course, his known character—he is the gentlest and most amiable of men—and his subsequent conduct—imbecile to the last degree if he had been guilty; but, as a lawyer, I can’t help seeing that appearances are almost hopelessly against him.”

“We won’t say ‘hopelessly,’” replied Thorndyke, as we took our places in the carriage, “though I expect the police are pretty cocksure. When does the inquest open?”

“To-day at four. I have obtained an order from the coroner for you to examine the body and be present at the post-mortem.”

“Do you happen to know the exact position of the wound?”
“Yes; it is a little above and behind the left ear—a horrible round hole, with a ragged cut or tear running from it to the side of the forehead.”

“And how was the body lying?”

“Right along the floor, with the feet close to the off-side door.”

“Was the wound on the head the only one?”

“No; there was a long cut or bruise on the right cheek—a contused wound the police surgeon called it, which he believes to have been inflicted with a heavy and rather blunt weapon. I have not heard of any other wounds or bruises.”

“Did anyone enter the train yesterday at Shinglehurst?” Thorndyke asked.

“No one entered the train after it left Halbury.”

Thorndyke considered these statements in silence, and presently fell into a brown study, from which he roused only as the train moved out of Shinglehurst station.

“It would be about here that the murder was committed,” said Mr. Stopford; “at least, between here and Woldhurst.”

Thorndyke nodded rather abstractedly, being engaged at the moment in observing with great attention the objects that were visible from the windows.

“I notice,” he remarked presently, “a number of chips scattered about between the rails, and some of the chair-wedges look new. Have there been any platelayers at work lately?”

“Yes,” answered Stopford, “they are on the line now, I believe—at least, I saw a gang working near Woldhurst yesterday, and they are said to have set a rick on fire; I saw it smoking when I came down.”

“Indeed; and this middle line of rails is, I suppose, a sort of siding?”

“Yes; they shunt the goods trains and empty trucks on to it. There are the remains of the rick—still smouldering, you see.”

Thorndyke gazed absently at the blackened heap until an empty cattle-truck on the middle track hid it from view. This was succeeded by a line of goods-waggons, and these by a passenger coach, one compartment of which—a first-class—was closed up and sealed. The train now began to slow down rather suddenly, and a couple of minutes later we brought up in Woldhurst station.

It was evident that rumours of Thorndyke’s advent had preceded us, for the entire staff—two porters, an inspector, and the station-master—were waiting expectantly on the platform, and the latter came forward, regardless of his dignity, to help us with our luggage.

“Do you think I could see the carriage?” Thorndyke asked the solicitor.

“Not the inside, sir,” said the station-master, on being appealed to. “The police have sealed it up. You would have to ask the inspector.”

“Well, I can have a look at the outside, I suppose?” said Thorndyke, and to this the station-master readily agreed, and offered to accompany us.

“What other first-class passengers were there?” Thorndyke asked.

“None, sir. There was only one first-class coach, and the deceased was the only person in it. It has given us all a dreadful turn, this affair has,” he continued, as we set off up the line. “I was on the platform when the train came in. We were watching a rick that was burning up the line, and a rare blaze it made, too; and I was just saying that we should have to move the cattle-truck that was on the mid-track, because, you see, sir, the smoke and sparks were blowing across, and I thought it would frighten the poor beasts. And Mr. Felton he don’t like his beasts handled roughly. He says it spoils the meat.”

“No doubt he is right,” said Thorndyke. “But now, tell me, do you think it is possible for any person to board or leave the train on the off-side unobserved? Could a man, for instance, enter a compartment on the off-side at one station and drop off as the train was slowing down at the next, without being seen?”

“I doubt it,” replied the station-master. “Still, I wouldn’t say it is impossible.”

“Thank you. Oh, and there’s another question. You have a gang of men at work on the line, I see. Now, do those men belong to the district?”

“No, sir; they are strangers, every one, and pretty rough diamonds some of ’em are. But I shouldn’t say there was any real harm in ’em. If you was suspecting any of ’em of being mixed up in this—”

“I am not,” interrupted Thorndyke rather shortly. “I suspect nobody; but I wish to get all the facts of the case at the outset.”

“Naturally, sir,” replied the abashed official; and we pursued our way in silence.

“Do you remember, by the way,” said Thorndyke, as we approached the empty coach, “whether the off-side door of the compartment was closed and locked when the body was discovered?”
“It was closed, sir, but not locked. Why, sir, did you think—?”

“Nothing, nothing. The sealed compartment is the one, of course?”

Without waiting for a reply, he commenced his survey of the coach, while I gently restrained our two companions from shadowing him, as they were disposed to do. The off-side footboard occupied his attention specially, and when he had scrutinized minutely the part opposite the fatal compartment, he walked slowly from end to end with his eyes but a few inches from its surface, as though he was searching for something.

Near what had been the rear end he stopped, and drew from his pocket a piece of paper; then, with a moistened finger-tip he picked up from the footboard some evidently minute object, which he carefully transferred to the paper, folding the latter and placing it in his pocket-book.

He next mounted the footboard, and, having peered in through the window of the sealed compartment, produced from his pocket a small insufflator or powder-blower, with which he blew a stream of impalpable smoke-like powder on to the edges of the middle window, bestowing the closest attention on the irregular dusty patches in which it settled, and even measuring one on the jamb of the window with a pocket-rule. At length he stepped down, and, having carefully looked over the near-side footboard, announced that he had finished for the present.

As we were returning down the line, we passed a working man, who seemed to be viewing the chairs and sleepers with more than casual interest.

“That, I suppose, is one of the plate-layers?” Thorndyke suggested to the station-master.

“Yes, the foreman of the gang,” was the reply.

“I’ll just step back and have a word with him, if you will walk on slowly.” And my colleague turned back briskly and overtook the man, with whom he remained in conversation for some minutes.

“I think I see the police inspector on the platform,” remarked Thorndyke, as we approached the station.

“Yes, there he is,” said our guide. “Come down to see what you are after, sir, I expect.” Which was doubtless the case, although the officer professed to be there by the merest chance.

“You would like to see the weapon, sir, I suppose?” he remarked, when he had introduced himself.

“The umbrella-spike,” Thorndyke corrected. “Yes, if I may. We are going to the mortuary now.”

“Then you’ll pass the station on the way; so, if you care to look in, I will walk up with you.”

This proposition being agreed to, we all proceeded to the police-station, including the station-master, who was on the very tip-toe of curiosity.

“There you are, sir,” said the inspector, unlocking his office, and ushering us in. “Don’t say we haven’t given every facility to the defence. There are all the effects of the accused, including the very weapon the deed was done with.”

“Come, come,” protested Thorndyke; “we mustn’t be premature.” He took the stout ash staff from the officer, and, having examined the formidable spike through a lens, drew from his pocket a steel calliper-gauge, with which he carefully measured the diameter of the spike, and the staff to which it was fixed. “And now,” he said, when he had made a note of the measurements in his book, “we will look at the colour-box and the sketch. Ha! a very orderly man, your brother. Mr. Stopford. Tubes all in their places, palette-knives wiped clean, palette cleaned off and rubbed bright, brushes wiped—they ought to be washed before they stiffen—all this is very significant.” He unstrapped the sketch from the blank canvas to which it was pinned, and, standing it on a chair in a good light, stepped back to look at it.

“And you tell me that that is only three hours’ work!” he exclaimed, looking at the lawyer. “It is really a marvellous achievement.”

“My brother is a very rapid worker,” replied Stopford dejectedly.

“Yes, but this is not only amazingly rapid; it is in his very happiest vein—full of spirit and feeling. But we mustn’t stay to look at it longer.” He replaced the canvas on its pins, and having glanced at the locket and some other articles that lay in a drawer, thanked the inspector for his courtesy and withdrew.

“That sketch and the colour-box appear very suggestive to me,” he remarked, as we walked up the street.

“To me also,” said Stopford gloomily, “for they are under lock and key, like their owner, poor old fellow.”

He sighed heavily, and we walked on in silence.

The mortuary-keeper had evidently heard of our arrival, for he was waiting at the door with the key in his hand, and, on being shown the coroner’s order, unlocked the door, and we entered together; but, after a momentary glance at the ghostly, shrouded figure lying upon the slate table, Stopford turned pale and retreated, saying that he would wait for us outside with the mortuary-keeper.

As soon as the door was closed and locked on the inside, Thorndyke glanced curiously round the bare, whitewashed building. A stream of sunlight poured in through the skylight, and fell upon the silent form that lay so still under its covering-sheet, and one stray beam glanced into a corner by the door, where, on a row of pegs and a deal table, the dead woman’s clothing was displayed.
“There is something unspeakably sad in these poor relics, Jervis,” said Thorndyke, as we stood before them. “To me they are more tragic, more full of pathetic suggestion, than the corpse itself. See the smart, jaunty hat, and the costly skirts hanging there, so desolate and forlorn; the dainty lingerie on the table, neatly folded—by the mortuary-man’s wife, I hope—the little French shoes and open-work silk stockings. How pathetically eloquent they are of harmless, womanly vanity, and the gay, careless life, snapped short in the twinkling of an eye. But we must not give way to sentiment. There is another life threatened, and it is in our keeping.”

He lifted the hat from its peg, and turned it over in his hand. It was, I think, what is called a “picture-hat”—a huge, flat, shapeless mass of gauze and ribbon and feather, spangled over freely with dark-blue sequins. In one part of the brim was a ragged hole, and from this the glittering sequins dropped off in little showers when the hat was moved.

“This will have been worn tilted over on the left side,” said Thorndyke, “judging by the general shape and the position of the hole.”

“Yes,” I agreed. “Like that of the Duchess of Devonshire in Gainsborough’s portrait.”

“Exactly.”

He shook a few of the sequins into the palm of his hand, and, replacing the hat on its peg, dropped the little discs into an envelope, on which he wrote, “From the hat,” and slipped it into his pocket. Then, stepping over to the table, he drew back the sheet reverently and even tenderly from the dead woman’s face, and looked down at it with grave pity. It was a comely face, white as marble, serene and peaceful in expression, with half-closed eyes, and framed with a mass of brassy, yellow hair; but its beauty was marred by a long linear wound, half cut, half bruise, running down the right cheek from the eye to the chin.

“A handsome girl,” Thorndyke commented—“a dark-haired blonde. What a sin to have disfigured herself so with that horrible peroxide.” He smoothed the hair back from her forehead, and added: “She seems to have applied the stuff last about ten days ago. There is about a quarter of an inch of dark hair at the roots. What do you make of that wound on the cheek?”

“It looks as if she had struck some sharp angle in falling, though, as the seats are padded in first-class carriages, I don’t see what she could have struck.”

“No. And now let us look at the other wound. Will you note down the description?” He handed me his notebook, and I wrote down as he dictated: “A clean-punched circular hole in skull, an inch behind and above margin of left ear—diameter, an inch and seven-sixteenths; starred fracture of parietal bone; membranes perforated, and brain entered deeply; ragged scalp-wound, extending forward to margin of left orbit; fragments of gauze and sequins in edges of wound. That will do for the present. Dr. Morton will give us further details if we want them.”

He pocketed his callipers and rule, drew from the bruised scalp one or two loose hairs, which he placed in the envelope with the sequins, and, having looked over the body for other wounds or bruises (of which there were none), replaced the sheet, and prepared to depart.

As we walked away from the mortuary, Thorndyke was silent and deeply thoughtful, and I gathered that he was piecing together the facts that he had acquired. At length Mr. Stopford, who had several times looked at him curiously, said:

“The post-mortem will take place at three, and it is now only half-past eleven. What would you like to do next?”

Thorndyke, who, in spite of his mental preoccupation, had been looking about him in his usual keen, attentive way, halted suddenly.

“Your reference to the post-mortem,” said he, “reminds me that I forgot to put the ox-gall into my case.”

“Ox-gall!” I exclaimed, endeavouring vainly to connect this substance with the technique of the pathologist. “What were you going to do with—”

But here I broke off, remembering my friend’s dislike of any discussion of his methods before strangers.

“I suppose,” he continued, “there would hardly be an artist’s colourman in a place of this size?”

“I should think not,” said Stopford. “But couldn’t you get the stuff from a butcher? There’s a shop just across the road.”

“So there is,” agreed Thorndyke, who had already observed the shop. “The gall ought, of course, to be prepared, but we can filter it ourselves—that is, if the butcher has any. We will try him, at any rate.”

He crossed the road towards the shop, over which the name “Felton” appeared in gilt lettering, and, addressing himself to the proprietor, who stood at the door, introduced himself and explained his wants.

“Ox-gall?” said the butcher. “No, sir, I haven’t any just now; but I am having a beast killed this afternoon, and I can let you have some then. In fact,” he added, after a pause, “as the matter is of importance, I can have one killed at once if you wish it.”

“That is very kind of you,” said Thorndyke, “and it would greatly oblige me. Is the beast perfectly healthy?”

“They’re in splendid condition, sir. I picked them out of the herd myself. But you shall see them—ay, and choose the one that you’d like killed.”
“You are really very good,” said Thorndyke warmly. “I will just run into the chemist’s next door, and get a suitable bottle, and then I will avail myself of your exceedingly kind offer.”

He hurried into the chemist’s shop, from which he presently emerged, carrying a white paper parcel; and we then followed the butcher down a narrow lane by the side of his shop. It led to an enclosure containing a small pen, in which were confined three handsome steers, whose glossy, black coats contrasted in a very striking manner with their long, greyish-white, nearly straight horns.

“These are certainly very fine beasts, Mr. Felton,” said Thorndyke, as we drew up beside the pen, “and in excellent condition, too.”

He leaned over the pen and examined the beasts critically, especially as to their eyes and horns; then, approaching the nearest one, he raised his stick and bestowed a smart tap on the under-side of the right horn, following it by a similar tap on the left one, a proceeding that the beast viewed with stolid surprise.

“The state of the horns,” explained Thorndyke, as he moved on to the next steer, “enables one to judge, to some extent, of the beast’s health.”

“Lord bless you, sir,” laughed Mr. Felton, “they haven’t got no feeling in their horns, else what good ‘ud their horns be to ‘em?”

Apparently he was right, for the second steer was as indifferent to a sounding rap on either horn as the first. Nevertheless, when Thorndyke approached the third steer, I unconsciously drew nearer to watch; and I noticed that, as the stick struck the horn, the beast drew back in evident alarm, and that when the blow was repeated, it became manifestly uneasy.

“He don’t seem to like that,” said the butcher. “Seems as if—Hullo, that’s queer!”

Thorndyke had just brought his stick up against the left horn, and immediately the beast had winced and started back, shaking his head and moaning. There was not, however, room for him to back out of reach, and Thorndyke, by leaning into the pen, was able to inspect the sensitive horn, which he did with the closest attention, while the butcher looked on with obvious perturbation.

“You don’t think there’s anything wrong with this beast, sir, I hope,” said he.

“I can’t say without a further examination,” replied Thorndyke. “It may be the horn only that is affected. If you will have it sawn off close to the head, and sent up to me at the hotel, I will look at it and tell you. And, by way of preventing any mistakes, I will mark it and cover it up, to protect it from injury in the slaughter-house.”

He opened his parcel and produced from it a wide-mouthed bottle labelled “Ox-gall,” a sheet of gutta-percha tissue, a roller bandage, and a stick of sealing-wax. Handing the bottle to Mr. Felton, he encased the distal half of the horn in a covering by means of the tissue and the bandage, which he fixed securely with the sealing-wax.

“I'll saw the horn off and bring it up to the hotel myself, with the ox-gall,” said Mr. Felton. “You shall have them in half an hour.”

He was as good as his word, for in half an hour Thorndyke was seated at a small table by the window of our private sitting-room in the Black Bull Hotel. The table was covered with newspaper, and on it lay the long grey horn and Thorndyke’s travelling-case, now open and displaying a small microscope and its accessories. The butcher was seated solidly in an armchair waiting, with a half-suspicious eye on Thorndyke for the report; and I was endeavouring by cheerful talk to keep Mr. Stopford from sinking into utter despondency, though I, too, kept a furtive watch on my colleague’s rather mysterious proceedings.

I saw him unwind the bandage and apply the horn to his ear, bending it slightly to and fro. I watched him, as he scanned the surface closely through a lens, and observed him as he scraped some substance from the pointed end on to a glass slide, and, having applied a drop of some reagent, began to tease out the scraping with a pair of mounted needles. Presently he placed the slide under the microscope, and, having observed it attentively for a minute or two, turned round sharply.

“Come and look at this, Jervis,” said he.

I wanted no second bidding, being on tenterhooks of curiosity, but came over and applied my eye to the instrument.

“Well, what is it?” he asked.

“A multipolar nerve corpuscle—very shrivelled, but unmistakable.”

“And this?”

He moved the slide to a fresh spot.

“Two pyramidal nerve corpuscles and some portions of fibres.”

“And what do you say the tissue is?”

“Cortical brain substance, I should say, without a doubt.”

“I entirely agree with you. And that being so,” he added, turning to Mr. Stopford, “we may say that the case for the defence is practically complete.”
"What, in Heaven’s name, do you mean?” exclaimed Stopford, starting up.

“I mean that we can now prove when and where and how Miss Grant met her death. Come and sit down here, and I will explain. No, you needn’t go away, Mr. Felton. We shall have to subpoena you. Perhaps,” he continued, “we had better go over the facts and see what they suggest. And first we note the position of the body, lying with the feet close to the off-side door, showing that, when she fell, the deceased was sitting, or more probably standing, close to that door. Next there is this.” He drew from his pocket a folded paper, which he opened, displaying a tiny blue disc. “It is one of the sequins with which her hat was trimmed, and I have in this envelope several more which I took from the hat itself.

“This single sequin I picked up on the rear end of the off side footboard, and its presence there makes it nearly certain that at some time Miss Grant had put her head out of the window on that side.

“The next item of evidence I obtained by dusting the margins of the off-side window with a light powder, which made visible a greasy impression three and a quarter inches long on the sharp corner of the right-hand jamb (right-hand from the inside, I mean).

“And now as to the evidence furnished by the body. The wound in the skull is behind and above the left ear, is roughly circular, and measures one inch and seven-sixteenths at most, and a ragged scalp-wound runs from it towards the left eye. On the right cheek is a linear contused wound three and a quarter inches long. There are no other injuries.

“Our next facts are furnished by this.” He took up the horn and tapped it with his finger, while the solicitor and Mr. Felton stared at him in speechless wonder. “You notice it is a left horn, and you remember that it was highly sensitive. If you put your ear to it while I strain it, you will hear the grating of a fracture in the bony core. Now look at the point and end, and you will see several deep scratches running lengthwise, and where those scratches end the diameter of the horn is, as you see by this calliper-gauge, one inch and seven-sixteenths. Covering the scratches is a dry blood-stain, and at the extreme tip is a small mass of a dried substance which Dr. Jervis and I have examined with the microscope and are satisfied is brain tissue.”

“Good God!” exclaimed Stopford eagerly. “Do you mean to say—”

“Let us finish with the facts, Mr. Stopford,” Thorndyke interrupted. “Now, if you look closely at that blood-stain, you will see a short piece of hair stuck to the horn, and through this lens you can make out the root-bulb. It is a golden hair, you notice, but near the root it is black, and our calliper-gauge shows us that the black portion is fourteen sixty-fourths of an inch long. Now, in this envelope are some hairs that I removed from the dead woman’s head. They also are golden hairs, black at the roots, and when I measure the black portion I find it to be fourteen forty-sixths of an inch long. Then, finally, there is this.”

He turned the horn over, and pointed to a small patch of dried blood. Embedded in it was a blue sequin.

Mr. Stopford and the butcher both gazed at the horn in silent amazement; then the former drew a deep breath and looked up at Thorndyke.

“No doubt,” said he, “you can explain this mystery, but for my part I am utterly bewildered, though you are filling me with hope.”

“And yet the matter is quite simple,” returned Thorndyke, “even with these few facts before us, which are only a selection from the body of evidence in our possession. But I will state my theory, and you shall judge.” He rapidly sketched a rough plan on a sheet of paper, and continued: “These were the conditions when the train was approaching Woldhurst: Here was the passenger-coach, here was the burning rick, and here was a cattle-truck. This steer was in that truck. Now my hypothesis is that at that time Miss Grant was standing with her head out of the off-side window, watching the burning rick. Her wide hat, worn on the left side, hid from her view the cattle-truck which she was approaching, and then this is what happened.” He sketched another plan to a larger scale. “One of the steers—this one—had thrust its long horn out through the bars. The point of that horn struck the deceased’s head, driving her face violently against the corner of the window, and then, in disengaging, plunged its way through the scalp, and suffered a fracture of its core from the violence of the wrench. This hypothesis is inherently probable, it fits all the facts, and those facts admit of no other explanation.”

The solicitor sat for a moment as though dazed; then he rose impulsively and seized Thorndyke’s hands. “I don’t know what to say to you,” he exclaimed huskily, “except that you have saved my brother’s life, and for that may God reward you!”

The butcher rose from his chair with a slow grin.

“It seems to me,” said he, “as if that ox-gall was what you might call a blind, eh, sir?”

And Thorndyke smiled an inscrutable smile.

*****

When we returned to town on the following day we were a party of four, which included Mr. Harold Stopford. The verdict of “Death by misadventure,” promptly returned by the coroner’s jury, had been shortly followed by his release from custody, and he now sat with his brother and me, listening with rapt attention to Thorndyke’s analysis of the case.

“So, you see,” the latter concluded, “I had six possible theories of the cause of death worked out before I reached Halbury, and it only remained to select the one that fitted the facts. And when I had seen the cattle-truck, had picked up that sequin, had heard the description of the steers, and had seen the hat and the wounds, there was nothing left to do but
the filling in of details."

"And you never doubted my innocence?" asked Harold Stopford.

Thorndyke smiled at his quondam client.

"Not after I had seen your colour-box and your sketch," said he, "to say nothing of the spike."

V. — THE MOABITE CIPHER

A LARGE and motley crowd lined the pavements of Oxford Street as Thorndyke and I made our way leisurely eastward. Floral decorations and drooping bunting announced one of those functions inaugurated from time to time by a benevolent Government for the entertainment of fashionable loungers and the relief of distressed pickpockets. For a Russian Grand Duke, who had torn himself away, amidst valedictory explosions, from a loving if too demonstrative people, was to pass anon on his way to the Guildhall; and a British Prince, heroically indiscreet, was expected to occupy a seat in the ducal carriage.

Near Rathbone Place Thorndyke halted and drew my attention to a smart-looking man who stood lounging in a doorway, cigarette in hand.

"Our old friend Inspector Badger," said Thorndyke, "he seems mightily interested in that gentleman in the light overcoat. How d'ye do, Badger?" for at this moment the detective caught his eye and bowed. "Who is your friend?"

"That's what I want to know, sir," replied the inspector. "I've been shadowing him for the last half-hour, but I can't make him out, though I believe I've seen him somewhere. He don't look like a foreigner, but he has got something bulky in his pocket, so I must keep him in sight until the Duke is safely past. I wish," he added gloomily, "these beastly Russians would stop at home. They give us no end of trouble."

"Are you expecting any—occurrences, then?" asked Thorndyke.

"Bless you, sir," exclaimed Badger, "the whole route is lined with plain-clothes men. You see, it is known that several desperate characters followed the Duke to England, and there are a good many exiles living here who would like to have a rap at him. Hallo! What's he up to now?"

The man in the light overcoat had suddenly caught the inspector's too inquiring eye, and forthwith dived into the crowd at the edge of the pavement. In his haste he trod heavily on the foot of a big, rough-looking man, by whom he was in a moment hustled out into the road with such violence that he fell sprawling face downwards. It was an unlucky moment. A mounted constable was just then backing in upon the crowd, and before he could gather the meaning of the shout that arose from the bystanders, his horse had set down one hind-hoof firmly on the prostrate man's back.

The inspector signalled to a constable, who forthwith made a way for us through the crowd; but even as we approached the injured man, he rose stiffly and looked round with a pale, vacant face.

"Are you hurt?" Thorndyke asked gently, with an earnest look into the frightened, wondering eyes.

"No, sir," was the reply; "only I feel queer—sinking—just here."

He laid a trembling hand on his chest, and Thorndyke, still eyeing him anxiously, said in a low voice to the inspector: "Cab or ambulance, as quickly as you can."

A cab was led round from Newman Street, and the injured man put into it. Thorndyke, Badger, and I entered, and we drove off up Rathbone Place. As we proceeded, our patient's face grew more and more ashen, drawn, and anxious; his breathing was shallow and uneaven, and his teeth chattered slightly. The cab swung round into Goodge Street, and then—suddenly, in the twinkling of an eye—there came a change. The eyelids and jaw relaxed, the eyes became filmy, and the whole form subsided into the corner in a shrunken heap, with the strange gelatinous limpness of a body that is dead as a whole, while its tissues are still alive.

"God save us! The man's dead!" exclaimed the inspector in a shocked voice—for even policemen have their feelings. He sat staring at the corpse, as it nodded gently with the jolting of the cab, until we drew up inside the courtyard of the Middlesex Hospital, when he got out briskly, with suddenly renewed cheerfulness, to help the porter to place the body on the wheeled couch.

"We shall know who he is now, at any rate," said he, as we followed the couch to the casualty-room. Thorndyke nodded unsympathetically. The medical instinct in him was for the moment stronger than the legal.

The house-surgeon leaned over the couch, and made a rapid examination as he listened to our account of the accident. Then he straightened himself up and looked at Thorndyke.

"Internal haemorrhage, I expect," said he. "At any rate, he's dead, poor beggar!—as dead as Nebuchadnezzar. Ah! here comes a hobby; it's his affair now."

A sergeant came into the room, breathing quickly, and looked in surprise from the corpse to the inspector. But the latter, without loss of time, proceeded to turn out the dead man's pockets, commencing with the bulky object that had first attracted his attention; which proved to be a brown-paper parcel tied up with red tape.
“Pork-pie, begad!” he exclaimed with a crestfallen air as he cut the tape and opened the package. “You had better go through his other pockets, sergeant.”

The small heap of odds and ends that resulted from this process tended, with a single exception, to throw little light on the man’s identity; the exception being a letter, sealed, but not stamped, addressed in an exceedingly illiterate hand to Mr. Adolf Schönberg, 213, Greek Street, Soho.

“He was going to leave it by hand, I expect,” observed the inspector, with a wistful glance at the sealed envelope. “I think I’ll take it round myself, and you had better come with me, sergeant.”

He slipped the letter into his pocket, and, leaving the sergeant to take possession of the other effects, made his way out of the building.

“I suppose, Doctor,” said he, as we crossed into Berners Street, “you are not coming our way! Don’t want to see Mr. Schönberg, h’m?”

Thorndyke reflected for a moment. “Well, it isn’t very far, and we may as well see the end of the incident. Yes; let us go together.”

No. 213, Greek Street, was one of those houses that irresistibly suggest to the observer the idea of a church organ, either jamb of the doorway being adorned with a row of brass bell-handles corresponding to the stop-knobs.

These the sergeant examined with the air of an expert musician, and having, as it were, gauged the capacity of the instrument, selected the middle knob on the right-hand side and pulled it briskly; whereupon a first-floor window was thrown up and a head protruded. But it afforded us a momentary glimpse only, for, having caught the sergeant’s upturned eye, it retired with surprising precipitancy, and before we had time to speculate on the apparition, the street-door was opened and a man emerged. He was about to close the door after him when the inspector interposed.

“Does Mr. Adolf Schönberg live here?”

The new-comer, a very typical Jew of the red-haired type, surveyed us thoughtfully through his gold-rimmed spectacles as he repeated the name.

“Schönberg—Schönberg? Ah, yes! I know. He lives on the third-floor. I saw him go up a short time ago. Third-floor back;” and indicating the open door with a wave of the hand, he raised his hat and passed into the street.

“I suppose we had better go up,” said the inspector, with a dubious glance at the row of bell-pulls. He accordingly started up the stairs, and we all followed in his wake.

There were two doors at the back on the third-floor, but as the one was open, displaying an unoccupied bedroom, the inspector rapped smartly on the other. It flew open almost immediately, and a fierce-looking little man confronted us with a hostile stare.

“Well?” said he.

“Mr. Adolf Schönberg?” inquired the inspector.

“Well? What about him?” snapped our new acquaintance.

“I wished to have a few words with him,” said Badger.

“Then what the deuce do you come banging at my door for?” demanded the other.

“Why, doesn’t he live here?”

“No. First-floor front,” replied our friend, preparing to close the door.

“Pardon me,” said Thorndyke, “but what is Mr. Schönberg like? I mean—”

“Like?” interrupted the resident. “He’s like a blooming Sheeny, with a carroty beard and gold gig-lamps!” and, having presented this impressionist sketch, he brought the interview to a definite close by slamming the door and turning the key.

With a wrathful exclamation, the inspector turned towards the stairs, down which the sergeant was already clattering in hot haste, and made his way back to the ground-floor, followed, as before, by Thorndyke and me. On the doorstep we found the sergeant breathlessly interrogating a smartly-dressed youth, whom I had seen alight from a hansom as we entered the house, and who now stood with a notebook tucked under his arm, sharpening a pencil with deliberate care.

“Mr. James saw him come out, sir,” said the sergeant. “He turned up towards the Square.”

“Did he seem to hurry?” asked the inspector.

“Rather,” replied the reporter. “As soon as you were inside, he went off like a lamplighter. You won’t catch him now.”

“We don’t want to catch him,” the detective rejoined gruffly; then, backing out of earshot of the eager pressman, he said in a lower tone: “That was Mr. Schönberg, beyond a doubt, and it is clear that he has some reason for making himself scarce; so I shall consider myself justified in opening that note.”

He suited the action to the word, and, having cut the envelope open with official neatness, drew out the enclosure.

“My hat!” he exclaimed, as his eye fell upon the contents. “What in creation is this? It isn’t shorthand, but what the deuce
is it?"

He handed the document to Thorndyke, who, having held it up to the light and felt the paper critically, proceeded to examine it with keen interest. It consisted of a single half-sheet of thin notepaper, both sides of which were covered with strange, crabbed characters, written with a brownish-black ink in continuous lines, without any spaces to indicate the divisions into words; and, but for the modern material which bore the writing, it might have been a portion of some ancient manuscript or forgotten codex.

“What do you make of it, Doctor?” inquired the inspector anxiously, after a pause, during which Thorndyke had scrutinized the strange writing with knitted brows.

“Not a great deal,” replied Thorndyke, “The character is the Moabite or Phoenician—primitive Semitic, in fact—and reads from right to left. The language I take to be Hebrew. At any rate, I can find no Greek words, and I see here a group of letters which may form one of the few Hebrew words that I know—the word badim, ‘lies.’ But you had better get it deciphered by an expert.”

“If it is Hebrew,” said Badger, “we can manage it all right. There are plenty of Jews at our disposal.”

“You had much better take the paper to the British Museum,” said Thorndyke, “and submit it to the keeper of the Phoenician antiquities for decipherment.”

Inspector Badger smiled a foxy smile as he deposited the paper in his pocket-book. “We’ll see what we can make of it ourselves first,” he said; “but many thanks for your advice, all the same, Doctor. No, Mr. James, I can’t give you any information just at present; you had better apply at the hospital.”

“I suspect,” said Thorndyke, as we took our way homewards, “that Mr. James has collected enough material for his purpose already. He must have followed us from the hospital, and I have no doubt that he has his report, with ‘full details,’ mentally arranged at this moment. And I am not sure that he didn’t get a peep at the mysterious paper, in spite of the inspector’s precautions.”

“By the way,” I said, “what do you make of the document?”

“A cipher, most probably,” he replied. “It is written in the primitive Semitic alphabet, which, as you know, is practically identical with primitive Greek. It is written from right to left, like the Phoenician, Hebrew, and Moabite, as well as the earliest Greek, inscriptions. The paper is common cream-laid notepaper, and the ink is ordinary indelible Chinese ink, such as is used by draughtsmen. Those are the facts, and without further study of the document itself, they don’t carry us very far.”

“Why do you think it is a cipher rather than a document in straightforward Hebrew?”

“Because it is obviously a secret message of some kind. Now, every educated Jew knows more or less Hebrew, and, although he is able to read and write only the modern square Hebrew character, it is so easy to transpose one alphabet into another that the mere language would afford no security. Therefore, I expect that, when the experts translate this document, the translation or transliteration will be a mere farrago of unintelligible nonsense. But we shall see, and meanwhile the facts that we have offer several interesting suggestions which are well worth consideration.”

“As, for instance—?”

“Now, my dear Jervis,” said Thorndyke, shaking an admonitory forefinger at me, “don’t, I pray you, give way to mental indolence. You have these few facts that I have mentioned. Consider them separately and collectively, and in their relation to the circumstances. Don’t attempt to suck my brain when you have an excellent brain of your own to suck.”

On the following morning the papers fully justified my colleague’s opinion of Mr. James. All the events which had occurred, as well as a number that had not, were given in the fullest and most vivid detail, a lengthy reference being made to the paper “found on the person of the dead anarchist,” and “written in a private shorthand or cryptogram.”

The report concluded with the gratifying—though untrue—statement that “in this intricate and important case, the police have wisely secured the assistance of Dr. John Thorndyke, to whose acute intellect and vast experience the portentous cryptogram will doubtless soon deliver up its secret.”

“Very flattering,” laughed Thorndyke, to whom I read the extract on his return from the hospital, “but a little awkward if it should induce our friends to deposit a few trifling mementoes in the form of nitro-compounds on our main staircase or in the cellars. By the way, I met Superintendent Miller on London Bridge. The ‘cryptogram,’ as Mr. James calls it, has set Scotland Yard in a mighty ferment.”

“Naturally. What have they done in the matter?”

“They adopted my suggestion, after all, finding that they could make nothing of it themselves, and took it to the British Museum. The Museum people referred them to Professor Poppelbaum, the great palæographer, to whom they accordingly submitted it.”

“Did he express any opinion about it?”

“Yes, provisionally. After a brief examination, he found it to consist of a number of Hebrew words sandwiched between apparently meaningless groups of letters. He furnished the Superintendent off-hand with a translation of the words, and
Miller forthwith struck off a number of hectograph copies of it, which he has distributed among the senior officials of his department; so that at present”—here Thorndyke gave vent to a soft chuckle—“Scotland Yard is engaged in a sort of missing word—or, rather, missing sense—competition. Miller invited me to join in the sport, and to that end presented me with one of the hectograph copies on which to exercise my wits, together with a photograph of the document.”

“And shall you?” I asked.

“Not I,” he replied, laughing. “In the first place, I have not been formally consulted, and consequently am a passive, though interested, spectator. In the second place, I have a theory of my own which I shall test if the occasion arises. But if you would like to take part in the competition, I am authorized to show you the photograph and the translation. I will pass them on to you, and I wish you joy of them.”

He handed me the photograph and a sheet of paper that he had just taken from his pocket-book, and watched me with grim amusement as I read out the first few lines.

\[
\begin{align*}
\text{The Moabite Cipher.} \\
\text{“Woe, city, lies, robbery, prey, noise, whip, rattling, wheel, horse, chariot, day, darkness, gloominess, clouds, darkness, morning, mountain, people, strong, fire, them, flame.”}
\end{align*}
\]
“It doesn’t look very promising at first sight,” I remarked. “What is the Professor’s theory?”

“His theory— provisionally, of course—is that the words form the message, and the groups of letters represent mere filled-up spaces between the words.”

“But surely,” I protested, “that would be a very transparent device.”

Thorndyke laughed. “There is a childlike simplicity about it,” said he, “that is highly attractive—but discouraging. It is much more probable that the words are dummies, and that the letters contain the message. Or, again, the solution may lie in an entirely different direction. But listen! Is that cab coming here?”

It was. It drew up opposite our chambers, and a few moments later a brisk step ascending the stairs heralded a smart rat-tat at our door. Flinging open the latter, I found myself confronted by a well-dressed stranger, who, after a quick glance at me, peered inquisitively over my shoulder into the room.

“I am relieved, Dr. Jervis,” said he, “to find you and Dr. Thorndyke at home, as I have come on somewhat urgent professional business. My name,” he continued, entering in response to my invitation, “is Barton, but you don’t know me, though I know you both by sight. I have come to ask you if one of you—or, better still, both—could come to-night and see my brother.”

“That,” said Thorndyke, “depends on the circumstances and on the whereabouts of your brother.”

“The circumstances,” said Mr. Barton, “are, in my opinion, highly suspicious, and I will place them before you—of course, in strict confidence.”

Thorndyke nodded and indicated a chair.

“My brother,” continued Mr. Barton, taking the proffered seat, “has recently married for the second time. His age is fifty-five, and that of his wife twenty-six, and I may say that the marriage has been—well, by no means a success. Now, within the last fortnight, my brother has been attacked by a mysterious and extremely painful affection of the stomach, to which his doctor seems unable to give a name. It has resisted all treatment hitherto. Day by day the pain and distress increase, and I feel that, unless something decisive is done, the end cannot be far off.”

“Is the pain worse after taking food?” inquired Thorndyke.

“That’s just it!” exclaimed our visitor. “I see what is in your mind, and it has been in mine, too; so much so that I have tried repeatedly to obtain samples of the food that he is taking. And this morning I succeeded.” Here he took from his pocket a wide-mouthed bottle, which, disengaging from its paper wrappings, he laid on the table. “When I called, he was taking his breakfast of arrowroot, which he complained had a gritty taste, supposed by his wife to be due to the sugar. Now I had provided myself with this bottle, and, during the absence of his wife, I managed unobserved to convey a portion of the arrowroot that he had left into it, and I should be greatly obliged if you would examine it and tell me if this arrowroot contains anything that it should not.”

He pushed the bottle across to Thorndyke, who carried it to the window, and, extracting a small quantity of the contents with a glass rod, examined the pasty mass with the aid of a lens; then, lifting the bell-glass cover from the microscope, which stood on its table by the window, he smeared a small quantity of the suspected matter on to a glass slip, and placed it on the stage of the instrument.

“I observe a number of crystalline particles in this,” he said, after a brief inspection, “which have the appearance of arsenious acid.”

“Ah!” ejaculated Mr. Barton, “just what I feared. But are you certain?”

“No,” replied Thorndyke; “but the matter is easily tested.”

He pressed the button of the bell that communicated with the laboratory, a summons that brought the laboratory assistant from his lair with characteristic promptitude.

“Will you please prepare a Marsh’s apparatus, Polton,” said Thorndyke.

“I have a couple ready, sir,” replied Polton.

“Then pour the acid into one and bring it to me, with a tile.”

As his familiar vanished silently, Thorndyke turned to Mr. Barton.

“Supposing we find arsenic in this arrowroot, as we probably shall, what do you want us to do?”

“I want you to come and see my brother,” replied our client.

“Why not take a note from me to his doctor?”

“No; no; I want you to come—I should like you both to come—and put a stop at once to this dreadful business. Consider! It’s a matter of life and death. You won’t refuse! I beg you not to refuse me your help in these terrible circumstances.”

“Well,” said Thorndyke, as his assistant reappeared, “let us first see what the test has to tell us.”

Polton advanced to the table, on which he deposited a small flask, the contents of which were in a state of brisk effervescence, a bottle labelled “calcium hypochlorite,” and a white porcelain tile. The flask was fitted with a safety-funnel
and a glass tube drawn out to a fine jet, to which Polton cautiously applied a lighted match. Instantly there sprang from the jet a tiny, pale violet flame. Thorndyke now took the tile, and held it in the flame for a few seconds, when the appearance of the surface remained unchanged save for a small circle of condensed moisture. His next proceeding was to thin the arrowroot with distilled water until it was quite fluid, and then pour a small quantity into the funnel. It ran slowly down the tube into the flask, with the bubbling contents of which it became speedily mixed. Almost immediately a change began to appear in the character of the flame, which from a pale violet turned gradually to a sickly blue, while above it hung a faint cloud of white smoke. Once more Thorndyke held the tile above the jet, but this time, no sooner had the pallid flame touched the cold surface of the porcelain, than there appeared on the latter a glistening black stain.

“That is pretty conclusive,” observed Thorndyke, lifting the stopper out of the reagent bottle, “but we will apply the final test.” He dropped a few drops of the hypochlorite solution on to the tile, and immediately the black stain faded away and vanished. “We can now answer your question, Mr. Barton,” said he, replacing the stopper as he turned to our client. “The specimen that you brought us certainly contains arsenic, and in very considerable quantities.”

“Then,” exclaimed Mr. Barton, starting from his chair, “you will come and help me to rescue my brother from this dreadful peril. Don’t refuse me, Dr. Thorndyke, for mercy’s sake, don’t refuse.”

Thorndyke reflected for a moment.

“Before we decide,” said he, “we must see what engagements we have.”

With a quick, significant glance at me, he walked into the office, whither I followed in some bewilderment, for I knew that we had no engagements for the evening.

“Now, Jervis,” said Thorndyke, as he closed the office door, “what are we to do?”

“We must go, I suppose,” I replied. “It seems a pretty urgent case.”

“It does,” he agreed. “Of course, the man may be telling the truth, after all.”

“You don’t think he is, then?”

“No. It is a plausible tale, but there is too much arsenic in that arrowroot. Still, I think I ought to go. It is an ordinary professional risk. But there is no reason why you should put your head into the noose.”

“Thank you,” said I, somewhat huffily. “I don’t see what risk there is, but if any exists I claim the right to share it.”

“Very well,” he answered with a smile, “we will both go. I think we can take care of ourselves.”

He re-entered the sitting-room, and announced his decision to Mr. Barton, whose relief and gratitude were quite pathetic.

“But,” said Thorndyke, “you have not yet told us where your brother lives.”

“Rexford,” was the reply—“Rexford, in Essex. It is an out-of-the-way place, but if we catch the seven-fifteen train from Liverpool Street, we shall be there in an hour and a half.”

“And as to the return? You know the trains, I suppose?”

“Oh yes,” replied our client; “I will see that you don’t miss your train back.”

“Then I will be with you in a minute,” said Thorndyke; and, taking the still-bubbling flask, he retired to the laboratory, whence he returned in a few minutes carrying his hat and overcoat.

The cab which had brought our client was still waiting, and we were soon rattling through the streets towards the station, where we arrived in time to furnish ourselves with dinner-baskets and select our compartment at leisure.

During the early part of the journey our companion was in excellent spirits. He despatched the cold fowl from the basket and quaffed the rather indifferent claret with as much relish as if he had not had a single relation in the world, and after dinner he became genial to the verge of hilarity. But, as time went on, there crept into his manner a certain anxious restlessness. He became silent and preoccupied, and several times furtively consulted his watch.

“The train is confoundedly late!” he exclaimed irritably. “Seven minutes behind time already!”

“A few minutes more or less are not of much consequence,” said Thorndyke.

“No, of course not; but still—Ah, thank Heaven, here we are!”

He thrust his head out of the off-side window, and gazed eagerly down the line; then, leaping to his feet, he bustled out on to the platform while the train was still moving.

Even as we alighted a warning bell rang furiously on the up-platform, and as Mr. Barton hurried us through the empty booking-office to the outside of the station, the rumble of the approaching train could be heard above the noise made by our own train moving off.

“My carriage doesn’t seem to have arrived yet,” exclaimed Mr. Barton, looking anxiously up the station approach. “If you will wait here a moment, I will go and make inquiries.”

He darted back into the booking-office and through it on to the platform, just as the up-train roared into the station. Thorndyke followed him with quick but stealthy steps, and, peering out of the booking-office door, watched his
proceedings; then he turned and beckoned to me.

“There he goes,” said he, pointing to an iron footbridge that spanned the line; and, as I looked, I saw, clearly defined against the dim night sky, a flying figure racing towards the “up” side.

It was hardly two-thirds across when the guard’s whistle sang out its shrill warning.

“Quick, Jervis,” exclaimed Thorndyke; “she’s off!”

He leaped down on to the line, whither I followed instantly, and, crossing the rails, we clambered up together on to the foot-board opposite an empty first-class compartment. Thorndyke’s magazine knife, containing, among other implements, a railway-key, was already in his hand. The door was speedily unlocked, and, as we entered, Thorndyke ran through and looked out on to the platform.

“Just in time!” he exclaimed. “He is in one of the forward compartments.”

He relocked the door, and, seating himself, proceeded to fill his pipe.

“And now,” said I, as the train moved out of the station, “perhaps you will explain this little comedy.”

“With pleasure,” he replied, “if it needs any explanation. But you can hardly have forgotten Mr. James’s flattering remarks in his report of the Greek Street incident, clearly giving the impression that the mysterious document was in my possession. When I read that, I knew I must look out for some attempt to recover it, though I hardly expected such promptness. Still, when Mr. Barton called without credentials or appointment, I viewed him with some suspicion. That suspicion deepened when he wanted us both to come. It deepened further when I found an impossible quantity of arsenic in his sample, and it gave place to certainty when, having allowed him to select the trains by which we were to travel, I went up to the laboratory and examined the time-table; for then I found that the last train for London left Rexford ten minutes after we were due to arrive. Obviously this was a plan to get us both safely out of the way while he and some of his friends ransacked our chambers for the missing document.”

“I see; and that accounts for his extraordinary anxiety at the lateness of the train. But why did you come, if you knew it was a ‘plant’?”

“My dear fellow,” said Thorndyke, “I never miss an interesting experience if I can help it. There are possibilities in this, too, don’t you see?”

“But supposing his friends have broken into our chambers already?”

“That contingency has been provided for; but I think they will wait for Mr. Barton—and us.”

Our train, being the last one up, stopped at every station, and crawled slothfully in the intervals, so that it was past eleven o’clock when we reached Liverpool Street. Here we got out cautiously, and, mingling with the crowd, followed the unconscious Barton up the platform, through the barrier, and out into the street. He seemed in no special hurry, for, after pausing to light a cigar, he set off at an easy pace up New Broad Street.

Thorndyke hailed a hansom, and, motioning me to enter, directed the cabman to drive to Clifford’s Inn Passage.

“Sit well back,” said he, as we rattled away up New Broad Street. “We shall be passing our gay deceiver presently—in fact, there he is, a living, walking illustration of the folly of underrating the intelligence of one’s adversary.”

At Clifford’s Inn Passage we dismissed the cab, and, retreating into the shadow of the dark, narrow alley, kept an eye on the gate of Inner Temple Lane. In about twenty minutes we observed our friend approaching on the south side of Fleet Street. He halted at the gate, plied the knocker, and after a brief parley with the night-porter vanished through the wicket. We waited yet five minutes more, and then, having given him time to get clear of the entrance, we crossed the road.

The porter looked at us with some surprise.

“There’s a gentleman just gone down to your chambers, sir,” said he. “He told me you were expecting him.”

“Quite right,” said Thorndyke, with a dry smile, “I was. Good-night.”

We slunk down the lane, past the church, and through the gloomy cloisters, giving a wide berth to all lamps and lighted entries, until, emerging into Paper Buildings, we crossed at the darkest part to King’s Bench Walk, where Thorndyke made straight for the chambers of our friend Anstey, which were two doors above our own.

“Why are we coming here?” I asked, as we ascended the stairs.

But the question needed no answer when we reached the landing, for through the open door of our friend’s chambers I could see in the darkened room Anstey himself with two uniformed constables and a couple of plain-clothes men.

“There has been no signal yet, sir,” said one of the latter, whom I recognized as a detective-sergeant of our division.

“No,” said Thorndyke, “but the M.C. has arrived. He came in five minutes before us.”

“Then,” exclaimed Anstey, “the ball will open shortly, ladies and gents. The boards are waxed, the fiddlers are tuning up, and—”

“Not quite so loud, if you please, sir,” said the sergeant. “I think there is somebody coming up Crown Office Row.”

The ball had, in fact, opened. As we peered cautiously out of the open window, keeping well back in the darkened room, a
stealthy figure crept out of the shadow, crossed the road, and stole noiselessly into the entry of Thorndyke’s chambers. It was quickly followed by a second figure, and then by a third, in which I recognized our elusive client.

“Now listen for the signal,” said Thorndyke. “They won’t waste time. Confound that clock!”

The soft-voiced bell of the Inner Temple clock, mingling with the harsher tones of St. Dunstan’s and the Law Courts, slowly told out the hour of midnight; and as the last reverberations were dying away, some metallic object, apparently a coin, dropped with a sharp clink on to the pavement under our window.

At the sound the watchers simultaneously sprang to their feet.

“You two go first,” said the sergeant, addressing the uniformed men, who thereupon stole noiselessly, in their rubber-soled boots, down the stone stairs and along the pavement. The rest of us followed, with less attention to silence, and as we ran up to Thorndyke’s chambers, we were aware of quick but stealthy footsteps on the stairs above.

“They’ve been at work, you see,” whispered one of the constables, flashing his lantern on to the iron-bound outer door of our sitting-room, on which the marks of a large jemmy were plainly visible.

The sergeant nodded grimly, and, bidding the constables to remain on the landing, led the way upwards.

As we ascended, faint rustlings continued to be audible from above, and on the second-floor landing we met a man descending briskly, but without hurry, from the third. It was Mr. Barton, and I could not but admire the composure with which he passed the two detectives. But suddenly his glance fell on Thorndyke, and his composure vanished. With a wild stare of incredulous horror, he halted as if petrified; then he broke away and raced furiously down the stairs, and a moment later a muffled shout and the sound of a scuffle told us that he had received a check. On the next flight we met two more men, who, more hurried and less self-possessed, endeavoured to push past; but the sergeant barred the way.

“Well, bless me!” exclaimed the latter, “it’s Moakey; and isn’t that Tom Harris?”

“It’s all right, sergeant,” said Moakey plaintively, striving to escape from the officer’s grip. “We’ve come to the wrong house, that’s all.”

The sergeant smiled indulgently. “I know,” he replied. “But you’re always coming to the wrong house, Moakey; and now you’re just coming along with me to the right house.”

He slipped his hand inside his captive’s coat, and adroitly fished out a large, folding jemmy; whereupon the discomforted burglar abandoned all further protest.

On our return to the first-floor, we found Mr. Barton sulkily awaiting us, handcuffed to one of the constables, and watched by Polton with pensive disapproval.

“I needn’t trouble you to-night, Doctor,” said the sergeant, as he marshalled his little troop of captors and captives. “You’ll hear from us in the morning. Good-night, sir.”

The melancholy procession moved off down the stairs, and we retired into our chambers with Anstey to smoke a last pipe.

“A capable man, that Barton,” observed Thorndyke—“ready, plausible, and ingenious, but spoilt by prolonged contact with fools. I wonder if the police will perceive the significance of this little affair.”

“They will be more acute than I am if they do,” said I.

“Naturally,” interposed Anstey, who loved to “cheek” his revered senior, “because there isn’t any. It’s only Thorndyke’s bounce. He is really in a deuce of a fog himself.”

However this may have been, the police were a good deal puzzled by the incident, for, on the following morning, we received a visit from no less a person than Superintendent Miller, of Scotland Yard.

“This is a queer business,” said he, coming to the point at once—“this burglary, I mean. Why should they want to crack your place, right here in the Temple, too? You’ve got nothing of value here, have you? No ‘hard stuff,’ as they call it, for instance?”

“Not so much as a silver teaspoon,” replied Thorndyke, who had a conscientious objection to plate of all kinds.

“It’s odd,” said the superintendent, “deuced odd. When we got your note, we thought these anarchist idiots had mixed you up with the case—you saw the papers, I suppose—and wanted to go through your rooms for some reason. We thought we had our hands on the gang, instead of which we find a party of common crooks that we’re sick of the sight of. I tell you, sir, it’s annoying when you think you’ve hooked a salmon, to bring up a blooming eel.”

“It must be a great disappointment,” Thorndyke agreed, suppressing a smile.

“It is,” said the detective. “Not but what we’re glad enough to get these beggars, especially Halkett, or Barton, as he calls himself—a mighty slippery customer is Halkett, and mischievous, too—but we’re not wanting any disappointments just now. There was that big jewel job in Piccadilly, Taplin and Horne’s; I don’t mind telling you that we’ve not got the ghost of a clue. Then there’s this anarchist affair. We’re all in the dark there, too.”

“But what about the cipher?” asked Thorndyke.
“Oh, hang the cipher!” exclaimed the detective irritably. “This Professor Poppelbaum may be a very learned man, but he doesn’t help us much. He says the document is in Hebrew, and he has translated it into Double Dutch. Just listen to this!”

He dragged out of his pocket a bundle of papers, and, dabbing down a photograph of the document before Thorndyke, commenced to read the Professor’s report. “The document is written in the characters of the well-known inscription of Mesha, King of Moab (who the devil’s he? Never heard of him. Well known, indeed!) ‘The language is Hebrew, and the words are separated by groups of letters, which are meaningless, and obviously introduced to mislead and confuse the reader. The words themselves are not strictly consecutive, but, by the interpolation of certain other words, a series of intelligible sentences is obtained, the meaning of which is not very clear, but is no doubt allegorical. The method of decipherment is shown in the accompanying tables, and the full rendering suggested on the enclosed sheet. It is to be noted that the writer of this document was apparently quite unacquainted with the Hebrew language, as appears from the absence of any grammatical construction.’ That’s the Professor’s report, Doctor, and here are the tables showing how he worked it out. It makes my head spin to look at ‘em.”

He handed to Thorndyke a bundle of ruled sheets, which my colleague examined attentively for a while, and then passed on to me.

“This is very systematic and thorough,” said he. “But now let us see the final result at which he arrives.”

“It may be all very systematic,” growled the superintendent, sorting out his papers, “but I tell you, sir, it’s all BOSH!” The latter word he jerked out viciously, as he slapped down on the table the final product of the Professor’s labours. “There,” he continued, “that’s what he calls the ‘full rendering,’ and I reckon it’ll make your hair curl. It might be a message from Bedlam.”

Thorndyke took up the first sheet, and as he compared the constructed renderings with the literal translation, the ghost of a smile stole across his usually immovable countenance.

“The meaning is certainly a little obscure,” he observed, “though the reconstruction is highly ingenious; and, moreover, I think the Professor is probably right. That is to say, the words which he has supplied are probably the omitted parts of the passages from which the words of the cryptogram were taken. What do you think, Jervis?”

Handwritten: Analysis of the cipher with translation into modern square Hebrew characters + a translation into English. N.B. The cipher reads from right to left.

He handed me the two papers, of which one gave the actual words of the cryptogram, and the other a suggested reconstruction, with omitted words supplied. The first read:
“Woe city lies robbery prey noise whip rattling wheel horse chariot day darkness gloominess cloud darkness morning mountain people strong fire them flame.”

Turning to the second paper, I read out the suggested rendering:

“Woe to the bloody city! It is full of lies and robbery; the prey departeth not. The noise of a whip, and the noise of the rattling of the wheels, and of the prancing horses, and of the jumping chariots.

“A day of darkness and of gloominess, a day of clouds, and of thick darkness, as the morning spread upon the mountains, a great people and a strong.

“A fire devoureth before them, and behind them a flame burneth.”

Here the first sheet ended, and, as I laid it down, Thorndyke looked at me inquiringly.

“There is a good deal of reconstruction in proportion to the original matter,” I objected. “The Professor has ‘supplied’ more than three-quarters of the final rendering.”

“Exactly,” burst in the superintendent; “it’s all Professor and no cryptogram.”

“Still, I think the reading is correct,” said Thorndyke. “As far as it goes, that is.”

“Good Lord!” exclaimed the dismayed detective. “Do you mean to tell me, sir, that that balderdash is the real meaning of the thing?”

“I don’t say that,” replied Thorndyke. “I say it is correct as far as it goes; but I doubt its being the solution of the cryptogram.”

“Have you been studying that photograph that I gave you?” demanded Miller, with sudden eagerness.

“I have looked at it,” said Thorndyke evasively, “but I should like to examine the original if you have it with you.”

“I have,” said the detective. “Professor Poppelbaum sent it back with the solution. You can have a look at it, though I can’t leave it with you without special authority.”

He drew the document from his pocket-book and handed it to Thorndyke, who took it over to the window and scrutinized it closely. From the window he drifted into the adjacent office, closing the door after him; and presently the sound of a faint explosion told me that he had lighted the gas-fire.

“Oh, of course,” said Miller, taking up the translation again, “this gibberish is the sort of stuff you might expect from a parcel of crack-brained anarchists; but it doesn’t seem to mean anything.”

“Not to us,” I agreed; “but the phrases may have some pre-arranged significance. And then there are the letters between the words. It is possible that they may really form a cipher.”

“I suggested that to the Professor,” said Miller, “but he wouldn’t hear of it. He is sure they are only dummies.”

“I think he is probably mistaken, and so, I fancy, does my colleague. But we shall hear what he has to say presently.”

“Oh, I know what he will say,” growled Miller. “He will put the thing under the microscope, and tell us who made the paper, and what the ink is composed of, and then we shall be just where we were.” The superintendent was evidently deeply depressed.

We sat for some time pondering in silence on the vague sentences of the Professor’s translation, until, at length, Thorndyke reappeared, holding the document in his hand. He laid it quietly on the table by the officer, and then inquired:

“Is this an official consultation?”

“Certainly,” replied Miller. “I was authorized to consult you respecting the translation, but nothing was said about the original. Still, if you want it for further study, I will get it for you.”

“No, thank you,” said Thorndyke. “I have finished with it. My theory turned out to be correct.”

“Your theory!” exclaimed the superintendent, eagerly. “Do you mean to say—?”

“And, as you are consulting me officially, I may as well give you this.”

He held out a sheet of paper, which the detective took from him and began to read.

“What is this?” he asked, looking up at Thorndyke with a puzzled frown. “Where did it come from?”

“It is the solution of the cryptogram,” replied Thorndyke.

The detective re-read the contents of the paper, and, with the frown of perplexity deepening, once more gazed at my colleague.

“This is a joke, sir; you are fooling me,” he said sulkily.

“Nothing of the kind,” answered Thorndyke. “That is the genuine solution.”

“But it’s impossible!” exclaimed Miller. “Just look at it, Dr. Jervis.”

I took the paper from his hand, and, as I glanced at it, I had no difficulty in understanding his surprise. It bore a short
inscription in printed Roman capitals, thus:

"THE PICKERDILLEY STUF IS UP THE CHIMBLY 416 WARDOUR ST 2ND FLOUR BACK IT WAS HID BECOS OF OLD MOAKEYS JOOD MOKEY IS A BLITER."

"Then that fellow wasn’t an anarchist at all?” I exclaimed.

"No," said Miller. “He was one of Moakey’s gang. We suspected Moakey of being mixed up with that job, but we couldn’t fix it on him. By Jove!” he added, slapping his thigh, “if this is right, and I can lay my hands on the loot! Can you lend me a bag, doctor? I’m off to Wardour Street this very moment.”

We furnished him with an empty suit-case, and, from the window, watched him making for Mitre Court at a smart double.

“I wonder if he will find the booty,” said Thorndyke. “It just depends on whether the hiding-place was known to more than one of the gang. Well, it has been a quaint case, and instructive, too. I suspect our friend Barton and the evasive Schönberg were the collaborators who produced that curiosity of literature.”

“May I ask how you deciphered the thing?” I said. “It didn’t appear to take long.”

“It didn’t. It was merely a matter of testing a hypothesis; and you ought not to have to ask that question,” he added, with mock severity, “seeing that you had what turn out to have been all the necessary facts, two days ago. But I will prepare a document and demonstrate to you to-morrow morning.”

*****

“So Miller was successful in his quest,” said Thorndyke, as we smoked our morning pipes after breakfast. “The ‘entire swag,’ as he calls it, was ‘up the chimblly,’ undisturbed.”

He handed me a note which had been left, with the empty suit-case, by a messenger, shortly before, and I was about to read it when an agitated knock was heard at our door. The visitor, whom I admitted, was a rather haggard and dishevelled elderly gentleman, who, as he entered, peered inquisitively through his concave spectacles from one of us to the other.

“Allow me to introduce myself, gentlemen,” said he. “I am Professor Poppelbaum.”

Thorndyke bowed and offered a chair.

“I called yesterday afternoon,” our visitor continued, “at Scotland Yard, where I heard of your remarkable decipherment and of the convincing proof of its correctness. Thereupon I borrowed the cryptogram, and have spent the entire night in studying it, but I cannot connect your solution with any of the characters. I wonder if you would do me the great favour of enlightening me as to your method of decipherment, and so save me further sleepless nights? You may rely on my discretion.”

“Have you the document with you?” asked Thorndyke.

The Professor produced it from his pocket-book, and passed it to my colleague.

“You observe, Professor,” said the latter, “that this is a laid paper, and has no water-mark?”

“Yes, I noticed that.”

“And that the writing is in indelible Chinese ink?”

“Yes, yes,” said the savant impatiently; “but it is the inscription that interests me, not the paper and ink.”

“Precisely,” said Thorndyke. “Now, it was the ink that interested me when I caught a glimpse of the document three days ago. ‘Why,’ I asked myself, ‘should anyone use this troublesome medium—for this appears to be stick ink—when good writing ink is to be had?’ What advantages has Chinese ink over writing ink? It has several advantages as a drawing ink, but for writing purposes it has only one: it is quite unaffected by wet. The obvious inference, then, was that this document was, for some reason, likely to be exposed to wet. But this inference instantly suggested another, which I was yesterday able to put to the test—thus.”

He filled a tumbler with water, and, rolling up the document, dropped it in. Immediately there began to appear on it a new set of characters of a curious grey colour. In a few seconds Thorndyke lifted out the wet paper, and held it up to the light, and now there was plainly visible an inscription in transparent lettering, like a very distinct water-mark. It was in printed Roman capitals, written across the other writing, and read:

"THE PICKERDILLEY STUF IS UP THE CHIMBLY 416 WARDOUR ST 2ND FLOUR BACK IT WAS HID BECOS OF OLD MOAKEYS JOOD MOKEY IS A BLITER."

The Professor regarded the inscription with profound disfavour.

“How do you suppose this was done?” he asked gloomily.

“I will show you,” said Thorndyke. “I have prepared a piece of paper to demonstrate the process to Dr. Jervis. It is exceedingly simple.”

He fetched from the office a small plate of glass, and a photographic dish in which a piece of thin notepaper was soaking in water.
“This paper,” said Thorndyke, lifting it out and laying it on the glass, “has been soaking all night, and is now quite pulpy.”

He spread a dry sheet of paper over the wet one, and on the former wrote heavily with a hard pencil, “Moakey is a bliter.” On lifting the upper sheet, the writing was seen to be transferred in a deep grey to the wet paper, and when the latter was held up to the light the inscription stood out clear and transparent as if written with oil.

“When this dries,” said Thorndyke, “the writing will completely disappear, but it will reappear whenever the paper is again wetted.”

The Professor nodded.

“Very ingenious,” said he—“a sort of artificial palimpsest, in fact. But I do not understand how that illiterate man could have written in the difficult Moabite script.”

“He did not,” said Thorndyke. “The ‘cryptogram’ was probably written by one of the leaders of the gang, who, no doubt, supplied copies to the other members to use instead of blank paper for secret communications. The object of the Moabite writing was evidently to divert attention from the paper itself, in case the communication fell into the wrong hands, and I must say it seems to have answered its purpose very well.”

The Professor started, stung by the sudden recollection of his labours.

“Yes,” he snorted; “but I am a scholar, sir, not a policeman. Every man to his trade.”

He snatched up his hat, and with a curt “Good-morning,” flung out of the room in dudgeon.

Thorndyke laughed softly.

“Poor Professor!” he murmured. “Our playful friend Barton has much to answer for.”

VI. — THE MANDARIN’S PEARL

MR. BRODRIBB stretched out his toes on the kerb before the blazing fire with the air of a man who is by no means insensible to physical comfort.

“You are really an extraordinarily polite fellow, Thorndyke,” said he.

He was an elderly man, rosy-gilled, portly, and convivial, to whom a mass of bushy, white hair, an expansive double chin, and a certain prim sumptuousness of dress imparted an air of old-world distinction. Indeed, as he dipped an amethystine nose into his wine-glass, and gazed thoughtfully at the glowing end of his cigar, he looked the very type of the well-to-do lawyer of an older generation.

“You are really an extraordinarily polite fellow, Thorndyke,” said Mr. Brodribb.

“I know,” replied Thorndyke. “But why this reference to an admitted fact?”

“The truth has just dawned on me,” said the solicitor. “Here am I, dropping in on you, uninvited and unannounced, sitting in your own armchair before your fire, smoking your cigars, drinking your Burgundy—and deuced good Burgundy, too, let me add—and you have not dropped a single hint of curiosity as to what has brought me here.”

“I take the gifts of the gods, you see, and ask no questions,” said Thorndyke.

“Devilish handsome of you, Thorndyke—unsociable beggar like you, too,” rejoined Mr. Brodribb, a fan of wrinkles spreading out genially from the corners of his eyes; “but the fact is I have come, in a sense, on business—always glad of a pretext to look you up, as you know—but I want to take your opinion on a rather queer case. It is about young Calverley. You remember Horace Calverley? Well, this is his son. Horace and I were schoolmates, you know, and after his death the boy, Fred, hung on to me rather. We’re near neighbours down at Weybridge, and very good friends. I like Fred. He’s a good fellow, though cranky, like all his people.”

“What has happened to Fred Calverley?” Thorndyke asked, as the solicitor paused.

“Why, the fact is,” said Mr. Brodribb, “just lately he seems to be going a bit queer—not mad, mind you—at least, I think not—but undoubtedly queer. Now, there is a good deal of property, and a good many highly interested relatives, and, as a natural consequence, there is some talk of getting him certified. They’re afraid he may do something involving the estate or develop homicidal tendencies, and they talk of possible suicide—you remember his father’s death—but I say that’s all bunkum. The fellow is just a bit cranky, and nothing more.”

“What are his symptoms?” asked Thorndyke.

“Oh, he thinks he is being followed about and watched, and he has delusions; sees himself in the glass with the wrong face, and that sort of thing, you know.”

“You are not highly circumstantial,” Thorndyke remarked.

Mr. Brodribb looked at me with a genial smile.

“What a glutton for facts this fellow is, Jervis. But you’re right, Thorndyke; I’m vague. However, Fred will be here
Alfred, who has a large house at Weybridge. At this time he had a friend staying with him, a certain Captain Raggerton, and presently. We travel down together, and I took the liberty of asking him to call for me. We'll get him to tell you about his delusions, if you don't mind. He's not shy about them. And meanwhile I'll give you a few preliminary facts. The trouble began about a year ago. He was in a railway accident, and that knocked him all to pieces. Then he went for a voyage to recruit, and the ship broke her propeller-shaft in a storm and became helpless. That didn't improve the state of his nerves. Then he went down the Mediterranean, and after a month or two, back he came, no better than when he started. But here he is, I expect."

He went over to the door and admitted a tall, frail young man whom Thorndyke welcomed with quiet geniality, and settled in a chair by the fire. I looked curiously at our visitor. He was a typical neurotic—slender, fragile, eager. Wide-open blue eyes with broad pupils, in which I could plainly see the characteristic "hippus"—that incessant change of size that marks the unstable nervous equilibrium—parted lips, and wandering taper fingers, were as the stigmata of his disorder. He was of the stuff out of which prophets and devotees, martyrs, reformers, and third-rate poets are made.

"I have been telling Dr. Thorndyke about these nervous troubles of yours," said Mr. Brodribb presently. "I hope you don't mind. He is an old friend, you know, and he is very much interested."

"It is very good of him," said Calverley. Then he flushed deeply, and added: "But they are not really nervous, you know. They can't be merely subjective."

"You think they can't be?" said Thorndyke.

"No, I am sure they are not." He flushed again like a girl, and looked earnestly at Thorndyke with his big, dreamy eyes. "But you doctors," he said, "are so dreadfully sceptical of all spiritual phenomena. You are such materialists."

"Yes," said Mr. Brodribb; "the doctors are not hot on the supernatural, and that's the fact."

"Supposing you tell us about your experiences," said Thorndyke persuasively. "Give us a chance to believe, if we can't explain away."

Calverley reflected for a few moments; then, looking earnestly at Thorndyke, he said:

"Very well; if it won't bore you, I will. It is a curious story."

"I have told Dr. Thorndyke about your voyage and your trip down the Mediterranean," said Mr. Brodribb.

"Then," said Calverley, "I will begin with the events that are actually connected with these strange visitations. The first of these occurred in Marseilles. I was in a curio-shop there, looking over some Algerian and Moorish tilings, when my attention was attracted by a sort of charm or pendant that hung in a glass case. It was not particularly beautiful, but its appearance was quaint and curious, and took my fancy. It consisted of an oblong block of ebony in which was set a single pear-shaped pearl more than three-quarters of an inch long. The sides of the ebony block were lacquered—probably to conceal a joint—and bore a number of Chinese characters, and at the top was a little gold image with a hole through it, presumably for a string to suspend it by. Excepting for the pearl, the whole thing was uncommonly like one of those ornamental tablets of Chinese ink.

"Now, I had taken a fancy to the thing, and I can afford to indulge my fancies in moderation. The man wanted five pounds for it; he assured me that the pearl was a genuine one of fine quality, and obviously did not believe it himself. To me, however, it looked like a real pearl, and I determined to take the risk; so I paid the money, and he bowed me out with a smile—I may almost say a grin—of satisfaction. He would not have been so well pleased if he had followed me to a jeweller's to whom I took it for an expert opinion; for the jeweller pronounced the pearl to be undoubtedly genuine, and worth anything up to a thousand pounds.

"A day or two later, I happened to show my new purchase to some men whom I knew, who had dropped in at Marseilles in their yacht. They were highly amused at my having bought the thing, and when I told them what I had paid for it, they positively howled with derision.

"'Why, you silly guffin,' said one of them, a man named Halliwell, 'I could have had it ten days ago for half a sovereign, or probably five shillings. I wish now I had bought it; then I could have sold it to you.'"

"It seemed that a sailor had been hawking the pendant round the harbour, and had been on board the yacht with it.

"'Deuced anxious the beggar was to get rid of it, too,' said Halliwell, grinning at the recollection. 'Sware it was a genuine pearl of priceless value, and was willing to deprive himself of it for the trifling sum of half a jenny. But we'd heard that sort of thing before. However, the curio-man seems to have speculated on the chance of meeting with a greenhorn, and he seems to have pulled it off. Lucky curio man!'"

"I listened patiently to their gibes, and when they had talked themselves out I told them about the jeweller. They were most frightfully sick; and when we had taken the pendant to a dealer in gems who happened to be staying in the town, and he had offered me five hundred pounds for it, their language wasn't fit for a divinity students' debating club. Naturally the story got noise abroad, and when I left, it was the talk of the place. The general opinion was that the sailor, who was traced to a tea-ship that had put into the harbour, had stolen it from some Chinese passenger; and no less than seventeen different Chinamen came forward to claim it as their stolen property."

"Soon after this I returned to England, and, as my nerves were still in a very shaky state, I came to live with my cousin Alfred, who has a large house at Weybridge. At this time he had a friend staying with him, a certain Captain Raggerton, and
the two men appeared to be on very intimate terms. I did not take to Raggerton at all. He was a good-looking man, pleasant in his manners, and remarkably plausible. But the fact is—I am speaking in strict confidence, of course—he was a bad egg. He had been in the Guards, and I don't quite know why he left; but I do know that he played bridge and baccarat pretty heavily at several clubs, and that he had a reputation for being a rather uncomfortably lucky player. He did a good deal at the race-meetings, too, and was in general such an obvious undesirable that I could never understand my cousin's intimacy with him, though I must say that Alfred's habits had changed somewhat for the worse since I had left England.

“The fame of my purchase seems to have preceded me, for when, one day, I produced the pendant to show them, I found that they knew all about it. Raggerton had heard the story from a naval man, and I gathered vaguely that he had heard something that I had not, and that he did not care to tell me; for when my cousin and he talked about the pearl, which they did pretty often, certain significant looks passed between them, and certain veiled references were made which I could not fail to notice.

“One day I happened to be telling them of a curious incident that occurred on my way home. I had travelled to England on one of Holt's big China boats, not liking the crowd and bustle of the regular passenger-lines. Now, one afternoon, when we had been at sea a couple of days, I took a book down to my berth, intending to have a quiet read till tea-time. Soon, however, I dropped off into a doze, and must have remained asleep for over an hour. I awoke suddenly, and as I opened my eyes, I perceived that the door of the state-room was half-open, and a well-dressed Chinaman, in native costume, was looking in at me. He closed the door immediately, and I remained for a few moments paralyzed by the start that he had given me. Then I leaped from my bunk, opened the door, and looked out. But the alley-way was empty. The Chinaman had vanished as if by magic.

“This little occurrence made me quite nervous for a day or two, which was very foolish of me; but my nerves were all on edge—and I am afraid they are still.”

“Yes,” said Thorndyke. “There was nothing mysterious about the affair. These boats carry a Chinese crew, and the man you saw probably was a Serang, or whatever they call the gang-captains on these vessels. Or he may have been a native passenger who had strayed into the wrong part of the ship.”

“Exactly,” agreed our client. “But to return to Raggerton. He listened with quite extraordinary interest as I was telling this story, and when I had finished he looked very queerly at my cousin.

“A deuced odd thing, this, Calverley,” said he. ‘Of course, it may be only a coincidence, but it really does look as if there was something, after all, in that—’”

“‘Shut up, Raggerton,’ said my cousin. ‘We don’t want any of that rot.’

“‘What is he talking about?’ I asked.

“‘Oh, it’s only a rotten, silly yarn that he has picked up somewhere. You’re not to tell him, Raggerton.’

“‘I don’t see why I am not to be told,’ I said, rather sulkily. ‘I’m not a baby.’

“‘No,’ said Alfred, ‘but you’re an invalid. You don’t want any horrors.’

“In effect, he refused to go into the matter any further, and I was left on tenter-hooks of curiosity.

“However, the very next day I got Raggerton alone in the smoking-room, and had a little talk with him. He had just dropped a hundred pounds on a double event that hadn’t come off, and I expected to find him pliable. Nor was I disappointed, for, when we had negotiated a little loan, he was entirely at my service, and willing to tell me everything, on my promising not to give him away to Alfred.

“‘Now, you understand,’ he said, ‘that this yarn about your pearl is nothing but a damn silly fable that’s been going the round in Marseilles. I don’t know where it came from, or what sort of demented rotter invented it; I had it from a Johnnie in the Mediterranean Squadron, and you can have a copy of his letter if you want it.’

“I said that I did want it. Accordingly, that same evening he handed me a copy of the narrative extracted from his friend’s letter, the substance of which was this:

“About four months ago there was lying in Canton Harbour a large English barque. Her name is not mentioned, but that is not material to the story. She had got her cargo stowed and her crew signed on, and was only waiting for certain official formalities to be completed before putting to sea on her homeward voyage. Just ahead of her, at the same quay, was a Danish ship that had been in collision outside, and was now laid up pending the decision of the Admiralty Court. She had been unloaded, and her crew paid off, with the exception of one elderly man, who remained on board as ship-keeper. Now, a considerable part of the cargo of the English barque was the property of a certain wealthy mandarin, and this person had been about the vessel a good deal while she was taking in her lading.

“One day, when the mandarin was on board the barque, it happened that three of the seamen were sitting in the galley smoking and chatting with the cook—an elderly Chinaman named Wo-li—and the latter, pointing out the mandarin to the sailors, expatiated on his enormous wealth, assuring them that he was commonly believed to carry on his person articles of sufficient value to buy up the entire lading of a ship.

“Now, unfortunately for the mandarin, it chanced that these three sailors were about the greatest rascals on board; which is saying a good deal when one considers the ordinary moral standard that prevails in the forecastle of a sailing-ship.
Nor was Wo-li himself an angel; in fact, he was a consummate villain, and seems to have been the actual originator of the plot which was presently devised to rob the mandarin.

“This plot was as remarkable for its simplicity as for its cold-blooded barbarity. On the evening before the barque sailed, the three seamen, Nilsson, Foucault, and Parratt, proceeded to the Danish ship with a supply of whisky, made the ship-keeper royally drunk, and locked him up in an empty berth. Meanwhile Wo-li made a secret communication to the mandarin to the effect that certain stolen property, believed to be his, had been secreted in the hold of the empty ship. Thereupon the mandarin came down hot-foot to the quay-side, and was received on board by the three seamen, who had got the covers off the after-hatch in readiness. Parratt now ran down the iron ladder to show the way, and the mandarin followed; but when they reached the lower deck, and looked down the hatch into the black darkness of the lower hold, he seems to have taken fright, and begun to climb up again. Meanwhile Nilsson had made a running bowline in the end of a loose halyard that was rove through a block aloft, and had been used for hoisting out the cargo. As the mandarin came up, he leaned over the coaming of the hatch, dropped the noose over the Chinaman’s head, jerked it tight, and then he and Foucault hove on the fall of the rope. The unfortunate Chinaman was dragged from the ladder, and, as he swung clear, the two rascals let go the rope, allowing him to drop through the hatches into the lower hold. Then they belayed the rope, and went down below. Parratt had already lighted a slush-lamp, by the glimmer of which they could see the mandarin swinging to and fro like a pendulum within a few feet of the ballast, and still quivering and twitching in his death-throes. They were now joined by Wo-li, who had watched the proceedings from the quay, and the four villains proceeded, without loss of time, to rifle the body as it hung. To their surprise and disgust, they found nothing of value excepting an ebony pendant set with a single large pearl; but Wo-li, though evidently disappointed at the nature of the booty, assured his comrades that this alone was well worth the hazard, pointing out the great size and exceptional beauty of the pearl. As to this, the seamen know nothing of pearls, but the thing was done, and had to be made the best of; so they made the rope fast to the lower deck-beams, cut off the remainder and unrove it from the block, and went back to their ship.

"It was twenty-four hours before the ship-keeper was sufficiently sober to break out of the berth in which he had been locked, by which time the barque was well out to sea; and it was another three days before the body of the mandarin was found. An active search was then made for the murderers, but as they were strangers to the ship-keeper, no clues to their whereabouts could be discovered.

“Meanwhile, the four murderers were a good deal exercised as to the disposal of the booty. Since it could not be divided, it was evident that it must be entrusted to the keeping of one of them. The choice in the first place fell upon Wo-li, in whose chest the pendant was deposited as soon as the party came on board, it being arranged that the Chinaman should produce the jewel for inspection by his confederates whenever called upon.

“For six weeks nothing out of the common occurred; but then a very singular event befell. The four conspirators were sitting outside the galley one evening, when suddenly the cook uttered a cry of amazement and horror. The other three turned to see what it was that had so disturbed their comrade, and then they, too, were struck dumb with consternation; for, standing at the door of the companion-hatch—the barque was a flush-decked vessel—was the mandarin whom they had left for dead. He stood quietly regarding them for fully a minute, while they stared at him transfixed with terror. Then he beckoned to them, and went below.

“So petrified were they with astonishment and mortal fear that they remained for a long time motionless and dumb. At last they plucked up courage, and began to make furtive inquiries among the crew; but no one—not even the steward—knew anything of any passengers, or, indeed, of any Chinaman, on board the ship, excepting Wo-li.

“At day-break the next morning, when the cook’s mate went to the galley to fill the coppers, he found Wo-li hanging from a hook in the ceiling. The cook’s body was stiff and cold, and had evidently been hanging several hours. The report of the tragedy quickly spread through the ship, and the three conspirators hurried off to remove the pearl from the dead man’s chest before the officers should come to examine it. The cheap lock was easily picked with a bent wire, and the jewel abstracted; but now the question arose as to who should take charge of it. The eagerness to be the actual custodian of the precious bauble, which had been at first displayed, now gave place to equally strong reluctance. But someone had to take charge of it, and after a long and angry discussion Nilsson was prevailed upon to stow it in his chest.

"A fortnight passed. The three conspirators went about their duties soberly, like men burdened with some secret anxiety, and in their leisure moments they would sit and talk with bated breath of the apparition at the companion-hatch, and the mysterious death of their late comrade.

“At last the blow fell.

"It was at the end of the second dog-watch that the hands were gathered on the forecastle, preparing to make sail after a spell of bad weather. Suddenly Nilsson gave a husky shout, and rushed at Parratt, holding out the key of his chest.

“Here you, Parratt,’ he exclaimed, ‘go below and take that accursed thing out of my chest.’

“What for?’ demanded Parratt; and then he and Foucault, who was standing close by, looked aft to see what Nilsson was staring at.

“Instantly they both turned white as ghosts, and fell trembling so that they could hardly stand; for there was the mandarin, standing calmly by the companion, returning with a steady, impassive gape their looks of horror. And even as they looked he beckoned and went below.
“D’ye hear, Parratt?” gasped Nilsson; ‘take my key and do what I say, or else—’

“But at this moment the order was given to go aloft and set all plain sail; the three men went off to their respective posts, Nilsson going up the fore-topmast rigging, and the other two to the main-top. Having finished their work aloft, Foucault and Parratt who were both in the port watch, came down on deck, and then, it being their watch below, they went and turned in.

“When they turned out with their watch at midnight, they looked about for Nilsson, who was in the starboard watch, but he was nowhere to be seen. Thinking he might have slipped below unobserved, they made no remark, though they were very uneasy about him; but when the starboard watch came on deck at four o’clock, and Nilsson did not appear with his mates, the two men became alarmed, and made inquiries about him. It was now discovered that no one had seen him since eight o’clock on the previous evening, and, this being reported to the officer of the watch, the latter ordered all hands to be called. But still Nilsson did not appear. A thorough search was now instituted, both below and aloft, and as there was still no sign of the missing man, it was concluded that he had fallen overboard.

“But at eight o’clock two men were sent aloft to shake out the fore-royal. They reached the yard almost simultaneously, and were just stepping on to the foot-ropes when one of them gave a shout; then the pair came sliding down a backstay, with faces as white as tallow. As soon as they reached the deck, they took the officer of the watch forward, and, standing on the heel of the bowsprit, pointed aloft. Several of the hands, including Foucault and Parratt, had followed, and all looked up; and there they saw the body of Nilsson, hanging on the front of the fore-topgallant sail. He was dangling at the end of a gasket, and bouncing up and down on the taut belly of the sail as the ship rose and fell to the end of the sea.

“The two survivors were now in some doubt about having anything further to do with the pearl. But the great value of the jewel, and the consideration that it was now to be divided between two instead of four, tempted them. They abstracted it from Nilsson’s chest, and then, as they could not come to an agreement in any other way, they decided to settle who should take charge of it by tossing a coin. The coin was accordingly spun, and the pearl went to Foucault’s chest.

“From this moment Foucault lived in a state of continual apprehension. When on deck, his eyes were for ever wandering towards the companion hatch, and during his watch below, when not asleep, he would sit moody on his chest, lost in gloomy reflection. But a fortnight passed, then three weeks, and still nothing happened. Land was sighted, the Straits of Gibraltar passed, and the end of the voyage was but a matter of days. And still the dreaded mandarin made no sign.

“At length the ship was within twenty-four hours of Marseilles, to which port a large part of the cargo was consigned. Active preparations were being made for entering the port, and among other things the shore tackle was being overhauled. A share in this latter work fell to Foucault and Parratt, and about the middle of the second dog-watch—seven o’clock in the evening—they were sitting on the deck working an eye-splice in the end of a large rope. Suddenly Foucault, who was facing forward, saw his companion turn pale and stare astare with an expression of terror. He immediately turned and looked over his shoulder to see what Parratt was staring at. It was the mandarin, standing by the companion, gravely watching them; and as Foucault turned and met his gaze, the Chinaman beckoned and went below.

“For the rest of that day Parratt kept close to his terrified comrade, and during their watch below he endeavoured to remain awake, that he might keep his friend in view. Nothing happened through the night, and the following morning, when they came on deck for the forenoon watch, their port was well in sight. The two men now separated for the first time, Parratt going aft to take his trick at the wheel, and Foucault being set to help in getting ready the ground tackle.

“Half an hour later Parratt saw the mate stand on the rail and lean outboard, holding on to the mizzen-shrouds while he stared along the ship’s side. Then he jumped on to the deck and shouted angrily: ‘Forward, there! What the deuce is that man up to under the starboard cat-head?’

“The men on the forecastle rushed to the side and looked over; two of them leaned over the rail with the bight of a rope between them, and a third came running aft to the mate. ‘It’s Foucault, sir,’ Parratt heard him say. ‘He’s hanged himself from the cat-head.’

“As soon as he was off duty, Parratt made his way to his dead comrade’s chest, and, opening it with his pick-lock, took out the pearl. It was now his sole property, and, as the ship was within an hour or two of her destination, he thought he had little to fear from its murdered owner. As soon as the vessel was alongside the wharf, he would slip ashore and get rid of the jewel, even if he sold it at a comparatively low price. The thing looked perfectly simple.

“In actual practice, however, it turned out quite otherwise. He began by accosting a well-dressed stranger and offering the pendant for fifty pounds; but the only reply that he got was a knowing smile and a shake of the head. When this experience had been repeated a dozen times or more, and he had been followed up and down the streets for nearly an hour by a suspicious gendarme, he began to grow anxious. He visited quite a number of ships and yachts in the harbour, and at each refusal the price of his treasure came down, until he was eager to sell it for a few francs. But still no one would have it. Everyone took it for granted that the pearl was a sham, and most of the persons whom he accosted assumed that it had been stolen. The position was getting desperate. Evening was approaching—the time of the dreaded dog-watches—and still the pearl was in his possession. Gladly would he now have given it away for nothing, but he dared not try, for this would lay him open to the strongest suspicion.

“At last, in a by-street, he came upon the shop of a curio-dealer. Putting on a careless and cheerful manner, he entered and offered the pendant for ten francs. The dealer looked at it, shook his head, and handed it back.
“What will you give me for it?” demanded Parratt, breaking out into a cold sweat at the prospect of a final refusal.

“The dealer felt in his pocket, drew out a couple of francs, and held them out.

“Very well,” said Parratt. He took the money as calmly as he could, and marched out of the shop, with a gasp of relief, leaving the pendant in the dealer’s hand.

“The jewel was hung up in a glass case, and nothing more was thought about it until some ten days later, when an English tourist, who came into the shop, noticed it and took a liking to it. Thereupon the dealer offered it to him for five pounds, assuring him that it was a genuine pearl, a statement that, to his amazement, the stranger evidently believed. He was then deeply afflicted at not having asked a higher price, but the bargain had been struck, and the Englishman went off with his purchase.

“This was the story told by Captain Raggerton’s friend, and I have given it to you in full detail, having read the manuscript over many times since it was given to me. No doubt you will regard it as a mere traveller’s tale, and consider me a superstitious idiot for giving any credence to it.”

“It certainly seems more remarkable for picturesqueness than for credibility,” Thorndyke agreed. “May I ask,” he continued, “whether Captain Raggerton’s friend gave any explanation as to how this singular story came to his knowledge, or to that of anybody else?”

“Oh yes,” replied Calverley; “I forgot to mention that the seaman, Parratt, very shortly after he had sold the pearl, fell down the hatch into the hold as the ship was unloading, and was very badly injured. He was taken to the hospital, where he died on the following day; and it was while he was lying there in a dying condition that he confessed to the murder, and gave this circumstantial account of it.”

“I see,” said Thorndyke; “and I understand that you accept the story as literally true?”

“Undoubtedly.” Calverley flushed defiantly as he returned Thorndyke’s look, and continued: “You see, I am not a man of science: therefore my beliefs are not limited to things that can be weighed and measured. There are things, Dr. Thorndyke, which are outside the range of our puny intellects; things that science, with its arrogant materialism, puts aside and ignores with close-shut eyes. I prefer to believe in things which obviously exist, even though I cannot explain them. It is the humbler and, I think, the wiser attitude.”

“But, my dear Fred,” protested Mr. Brodribb, “this is a rank fairy-tale.”

Calverley turned upon the solicitor. “If you had seen what I have seen, you would not only believe: you would know.”

“Tell us what you have seen, then,” said Mr. Brodribb.

“I will, if you wish to hear it,” said Calverley. “I will continue the strange history of the Mandarin’s Pearl.”

He lit a fresh cigarette and continued:

“The night I came to Beechhurst—that is my cousin’s house, you know—a rather absurd thing happened, which I mention on account of its connection with what has followed. I had gone to my room early, and sat for some time writing letters before getting ready for bed. When I had finished my letters, I started on a tour of inspection of my room. I was then, you must remember, in a very nervous state, and it had become my habit to examine the room in which I was to sleep before undressing, looking under the bed, and in any cupboards and closets that there happened to be. Now, on looking round my new room, I perceived that there was a second door, and I at once proceeded to open it to see where it led to. As soon as I opened the door, I got a terrible start. I found myself looking into a narrow closet or passage, lined with pegs, on which the servant had hung some of my clothes; at the farther end was another door, and, as I stood looking into the closet, I observed, with startled amazement, a man standing holding the door half-open, and silently regarding me. I stood for a moment staring at him, with my heart thumping and my limbs all of a tremble; then I slammed the door and ran off to look for my cousin.

“He was in the billiard-room with Raggerton, and the pair looked up sharply as I entered.

“‘Alfred,’ I said, ‘where does that passage lead to out of my room?’

“‘Lead to?’ said he. ‘Why, it doesn’t lead anywhere. It used to open into a cross corridor, but when the house was altered, the corridor was done away with, and this passage closed up. It is only a cupboard now.’

“‘Well, there’s a man in it—or there was just now.’

“‘Nonsense!’ he exclaimed; ‘impossible! Let us go and look at the place.’

“He and Raggerton rose, and we went together to my room. As we flung open the door of the closet and looked in, we all three burst into a laugh. There were three men now looking at us from the open door at the other end, and the mystery was solved. A large mirror had been placed at the end of the closet to cover the partition which cut it off from the cross corridor.

“This incident naturally exposed me to a good deal of chaff from my cousin and Captain Raggerton; but I often wished that the mirror had not been placed there, for it happened over and over again that, going to the cupboard hurriedly, and not thinking of the mirror, I got quite a bad shock on being confronted by a figure apparently coming straight at me through an open door. In fact, it annoyed me so much, in my nervous state, that I even thought of asking my cousin to give me a different room; but, happening to refer to the matter when talking to Raggerton, I found the Captain so scornful of
And now I come to a very strange occurrence, which I shall relate quite frankly, although I know beforehand that you will set me down as a liar or a lunatic. I had been away from home for a fortnight, and as I returned rather late at night, I went straight to my room. Having partly undressed, I took my clothes in one hand and a candle in the other, and opened the cupboard door. I stood for a moment looking nervously at my double, standing, candle in hand, looking at me through the open door at the other end of the passage; then I entered, and, setting the candle on a shelf, proceeded to hang up my clothes. I had hung them up, and had just reached up for the candle, when my eye was caught by something strange in the mirror. It no longer reflected the candle in my hand, but instead of it, a large coloured paper lantern. I stood petrified with astonishment, and gazed into the mirror; and then I saw that my own reflection was changed, too; that, in place of my own figure, was that of an elderly Chinaman, who stood regarding me with stony calm.

"I must have stood for near upon a minute, unable to move and scarce able to breathe, face to face with that awful figure. At length I turned to escape, and, as I turned, he turned also, and I could see him, over my shoulder, hurrying away. As I reached the door, I halted for a moment, looking back with the door in my hand, holding the candle above my head; and even so he halted, looking back at me, with his hand upon the door and his lantern held above his head.

"I was so much upset that I could not go to bed for some hours, but continued to pace the room, in spite of my fatigue.
Now and again I was impelled, irresistibly, to peer into the cupboard, but nothing was to be seen in the mirror save my own figure, candle in hand, peeping in at me through the half-open door. And each time that I looked into my own white, horror-stricken face, I shut the door hastily and turned away with a shudder; for the pegs, with the clothes hanging on them, seemed to call to me. I went to bed at last, and before I fell asleep I formed the resolution that, if I was spared until the next day, I would write to the British Consul at Canton, and offer to restore the pearl to the relatives of the murdered mandarin.

“On the following day I wrote and despatched the letter, after which I felt more composed, though I was haunted continually by the recollection of that stony, impassive figure; and from time to time I felt an irresistible impulse to go and look in at the door of the closet, at the mirror and the pegs with the clothes hanging from them. I told my cousin of the visitation that I had received, but he merely laughed, and was frankly incredulous; while the Captain bluntly advised me not to be a superstitious donkey.

“For some days after this I was left in peace, and began to hope that my letter had appeased the spirit of the murdered man; but on the fifth day, about six o’clock in the evening, happening to want some papers that I had left in the pocket of a coat which was hanging in the closet, I went in to get them. I took in no candle, as it was not yet dark, but left the door wide open to light me. The coat that I wanted was near the end of the closet, not more than four paces from the mirror, and as I went towards it I watched my reflection rather nervously as it advanced to meet me. I found my coat, and as I felt for the papers, I still kept a suspicious eye on my double. And, even as I looked, a most strange phenomenon appeared: the mirror seemed for an instant to darken or cloud over, and then, as it cleared again, I saw, standing dark against the light of the open door behind him, the figure of the mandarin. After a single glance, I ran out of the closet, shaking with agitation; but as I turned to shut the door, I noticed that it was my own figure that was reflected in the glass. The Chinaman had vanished in an instant.

“It now became evident that my letter had not served its purpose, and I was plunged in despair; the more so since, on this day, I felt again the dreadful impulse to go and look at the pegs on the walls of the closet. There was no mistaking the meaning of that impulse, and each time that I went, I dragged myself away reluctantly, though shivering with horror. One circumstance, indeed, encouraged me a little; the mandarin had not, on either occasion, beckoned to me as he had done to the sailors, so that perhaps some way of escape yet lay open to me.

“During the next few days I considered very earnestly what measures I could take to avert the doom that seemed to be hanging over me. The simplest plan, that of passing the pearl on to some other person, was out of the question; it would be nothing short of murder. On the other hand, I could not wait for an answer to my letter; for even if I remained alive, I felt that my reason would have given way long before the reply reached me. But while I was debating what I should do, the mandarin appeared to me again; and then, after an interval of only two days, he came to me once more. That was last night. I remained gazing at him, fascinated, with my flesh creeping, as he stood, lantern in hand, looking steadily in my face. At last he held out his hand to me, as if asking me to give him the pearl; then the mirror darkened, and he vanished in a flash; and in the place where he had stood there was my own reflection looking at me out of the glass.

“That last visitation decided me. When I left home this morning the pearl was in my pocket, and as I came over Waterloo Bridge, I leaned over the parapet and flung the thing into the water. After that I felt quite relieved for a time; I had shaken the accursed thing off without involving anyone in the curse that it carried. But presently I began to feel fresh misgivings, and the conviction has been growing upon me all day that I have done the wrong thing. I have only placed it for ever beyond the reach of its owner, whereas I ought to have burnt it, after the Chinese fashion, so that its non-material essence could have joined the spiritual body of him to whom it had belonged when both were clothed with material substance.

“But it can’t be altered now. For good or for evil, the thing is done, and God alone knows what the end of it will be.”

As he concluded, Calverley uttered a deep sigh, and covered his face with his slender, delicate hands. For a space we were all silent and, I think, deeply moved; for, grotesquely unreal as the whole thing was, there was a pathos, and even a tragedy, in it that we all felt to be very real indeed.

Suddenly Mr. Brodribb started and looked at his watch.

“Good gracious, Calverley, we shall lose our train.”

The young man pulled himself together and stood up. “We shall just do it if we go at once,” said he. “Good-bye,” he added, shaking Thornydeke’s hand and mine. “You have been very patient, and I have been rather prosy, I am afraid. Come along, Mr. Brodribb.”

Thornydeke and I followed them out on to the landing, and I heard my colleague say to the solicitor in a low tone, but very earnestly: “Get him away from that house, Brodribb, and don’t let him out of your sight for a moment.”

I did not catch the solicitor’s reply, if he made any, but when we were back in our room I noticed that Thornydeke was more agitated than I had ever seen him.

“I ought not to have let them go,” he exclaimed. “Confound me! If I had had a grain of wit, I should have made them lose their train.”

He lit his pipe and fell to pacing the room with long strides, his eyes bent on the floor with an expression sternly reflective. At last, finding him hopelessly taciturn, I knocked out my pipe and went to bed.
As I was dressing on the following morning, Thorndyke entered my room. His face was grave even to sternness, and he held a telegram in his hand.

"I am going to Weybridge this morning," he said shortly, holding the "flimsy" out to me. "Shall you come?"

I took the paper from him, and read:

"Come, for God’s sake! F. C. is dead. You will understand.—BRODRIBB."

I handed him back the telegram, too much shocked for a moment to speak. The whole dreadful tragedy summed up in that curt message rose before me in an instant, and a wave of deep pity swept over me at this miserable end to the sad, empty life.

"What an awful thing, Thorndyke!" I exclaimed at length. "To be killed by a mere grotesque delusion."

"Do you think so?" he asked dryly. "Well, we shall see; but you will come?"

"Yes," I replied; and as he retired, I proceeded hurriedly to finish dressing.

Half an hour later, as we rose from a rapid breakfast, Polton came into the room, carrying a small roll-up case of tools and a bunch of skeleton keys.

"Will you have them in a bag, sir?" he asked.

"No," replied Thorndyke; "in my overcoat pocket. Oh, and here is a note, Polton, which I want you to take round to Scotland Yard. It is to the Assistant Commissioner, and you are to make sure that it is in the right hands before you leave. And here is a telegram to Mr. Brodribb."

He dropped the keys and the tool-case into his pocket, and we went down together to the waiting hansom.

At Weybridge Station we found Mr. Brodribb pacing the platform in a state of extreme dejection. He brightened up somewhat when he saw us, and wrung our hands with emotional heartiness.

"It was very good of you both to come at a moment's notice," he said warmly, "and I feel your kindness very much. You understood, of course, Thorndyke?"

"Yes," Thorndyke replied. "I suppose the mandarin beckoned to him."

Mr. Brodribb turned with a look of surprise. "How did you guess that?" he asked; and then, without waiting for a reply, he took from his pocket a note, which he handed to my colleague. "The poor old fellow left this for me," he said. "The servant found it on his dressing-table."

Thorndyke glanced through the note and passed it to me. It consisted of but a few words, hurriedly written in a tremulous hand.

"He has beckoned to me, and I must go. Good-bye, dear old friend."

"How does his cousin take the matter?" asked Thorndyke.

"He doesn't know of it yet," replied the lawyer. "Alfred and Raggerton went out after an early breakfast, to cycle over to Guildford on some business or other, and they have not returned yet. The catastrophe was discovered soon after they left. The maid went to his room with a cup of tea, and was astonished to find that his bed had not been slept in. She ran down in alarm and reported to the butler, who went up at once and searched the room; but he could find no trace of the missing one, except my note, until it occurred to him to look in the cupboard. As he opened the door he got rather a start from his own reflection in the mirror; and then he saw poor Fred hanging from one of the pegs near the end of the closet, close to the glass. It's a melancholy affair—but here is the house, and here is the butler waiting for us. Mr. Alfred is not back yet, then, Stevens?"

"No, sir." The white-faced, frightened-looking man had evidently been waiting at the gate from distaste of the house, and he now walked back with manifest relief at our arrival. When we entered the house, he ushered us without remark up to the first-floor, and, preceding us along a corridor, halted near the end. "That's the room, sir," said he; and without another word he turned and went down the stairs.

We entered the room, and Mr. Brodribb followed on tiptoe, looking about him fearfully, and casting awe-struck glances at the shrouded form on the bed. To the latter Thorndyke advanced, and gently drew back the sheet.

"You'd better not look, Brodribb," said he, as he bent over the corpse. He felt the limbs and examined the cord, which still remained round the neck, its raggedly-severed end testifying to the terror of the servants who had cut down the body. Then he replaced the sheet and looked at his watch. "It happened at about three o'clock in the morning," said he. "He must have struggled with the impulse for some time, poor fellow! Now let us look at the cupboard."

We went together to a door in the corner of the room, and, as we opened it, we were confronted by three figures, apparently looking in at us through an open door at the other end.

"It is really rather startling," said the lawyer, in a subdued voice, looking almost apprehensively at the three figures that advanced to meet us. "The poor lad ought never to have been here."
It was certainly an eerie place, and I could not but feel, as we walked down the dark, narrow passage, with those other three dimly-seen figures silently coming towards us, and mimicking our every gesture, that it was no place for a nervous, superstitious man like poor Fred Calverley. Close to the end of the long row of pegs was one from which hung an end of stout box-cord, and to this Mr. Brodribb pointed with an awe-struck gesture. But Thorndyke gave it only a brief glance, and then walked up to the mirror, which he proceeded to examine minutely. It was a very large glass, nearly seven feet high, extending the full width of the closet, and reaching to within a foot of the floor; and it seemed to have been let into the partition from behind, for, both above and below, the woodwork was in front of it. While I was making these observations, I watched Thorndyke with no little curiosity. First he rapped his knuckles on the glass; then he lighted a wax match, and, holding it close to the mirror, carefully watched the reflection of the flame. Finally, laying his cheek on the glass, he held the match at arm's length, still close to the mirror, and looked at the reflection along the surface. Then he blew out the match and walked back into the room, shutting the cupboard door as we emerged.

“I think,” said he, “that as we shall all undoubtedly be subpoenaed by the coroner, it would be well to put together a few notes of the facts. I see there is a writing-table by the window, and I would propose that you, Brodribb, just jot down a précis of the statement that you heard last night, while Jervis notes down the exact condition of the body. While you are doing this, I will take a look round.”

“We might find a more cheerful place to write in,” grumbled Mr. Brodribb; “however—”

Without finishing the sentence, he sat down at the table, and, having found some sermon paper, dipped a pen in the ink by way of encouraging his thoughts. At this moment Thorndyke quietly slipped out of the room, and I proceeded to make a detailed examination of the body: in which occupation I was interrupted at intervals by requests from the lawyer that I should refresh his memory.

We had been occupied thus for about a quarter of an hour, when a quick step was heard outside, the door was opened abruptly, and a man burst into the room. Brodribb rose and held out his hand.

“This is a sad home-coming for you, Alfred,” said he.

“Yes, my God!” the newcomer exclaimed. “It’s awful.”

He looked askance at the corpse on the bed, and wiped his forehead with his handkerchief. Alfred Calverley was not extremely prepossessing. Like his cousin, he was obviously neurotic, but there were signs of dissipation in his face, which, just now, was pale and ghastly, and wore an expression of abject fear. Moreover, his entrance was accompanied by that of a perceptible odour of brandy.

He had walked over, without noticing me, to the writing-table, and as he stood there, talking in subdued tones with the lawyer, I suddenly found Thorndyke at my side. He had stolen in noiselessly through the door that Calverley had left open.

“Show him Brodribb’s note,” he whispered, “and then make him go in and look at the peg.”

With this mysterious request, he slipped out of the room as silently as he had come, unperceived either by Calverley or the lawyer.

“Has Captain Raggerton returned with you?” Brodribb was inquiring.

“No, he has gone into the town,” was the reply; “but he won’t be long. This will be a frightful shock to him.”

At this point I stepped forward. “Have you shown Mr. Calverley the extraordinary letter that the deceased left for you?” I asked.

“What letter was that?” demanded Calverley, with a start.

Mr. Brodribb drew forth the note and handed it to him. As he read it through, Calverley turned white to the lips, and the paper trembled in his hand.

“He has beckoned to me, and I must go,” he read. Then, with a furtive glance at the lawyer: “Who had beckoned? What did he mean?”

Mr. Brodribb briefly explained the meaning of the allusion, adding: “I thought you knew all about it.”

“Yes, yes,” said Calverley, with some confusion; “I remember the matter now you mention it. But it’s all so dreadful and bewildering.”

At this point I again interposed. “There is a question,” I said, “that may be of some importance. It refers to the cord with which the poor fellow hanged himself. Can you identify that cord, Mr. Calverley?”

“I!” he exclaimed, staring at me, and wiping the sweat from his white face; “how should I? Where is the cord?”

“Part of it is still hanging from the peg in the closet. Would you mind looking at it?”

“If you would very kindly fetch it—you know I—er—naturally—have a—”

“It must not be disturbed before the inquest,” said I; “but surely you are not afraid—”

“I didn’t say I was afraid,” he retorted angrily. “Why should I be?”

With a strange, tremulous swagger, he strode across to the closet, flung open the door, and plunged in.
A moment later we heard a shout of horror, and he rushed out, livid and gasping.

“What is it, Calverley?” exclaimed Mr. Brodribb, starting up in alarm.

But Calverley was incapable of speech. Dropping limply into a chair, he gazed at us for a while in silent terror; then he fell back uttering a wild shriek of laughter.

Mr. Brodribb looked at him in amazement. “What is it, Calverley?” he asked again.

As no answer was forthcoming, he stepped across to the open door of the closet and entered, peering curiously before him. Then he, too, uttered a startled exclamation, and backed out hurriedly, looking pale and flurried.

“Bless my soul!” he ejaculated. “Is the place bewitched?”

He sat down heavily and stared at Calverley, who was still shaking with hysterical laughter; while I, now consumed with curiosity, walked over to the closet to discover the cause of their singular behaviour. As I flung open the door, which the lawyer had closed, I must confess to being very considerably startled; for though the reflection of the open door was plain enough in the mirror, my own reflection was replaced by that of a Chinaman. After a momentary pause of astonishment, I entered the closet and walked towards the mirror; and simultaneously the figure of the Chinaman entered and walked towards me. I had advanced more than halfway down the closet when suddenly the mirror darkened; there was a whirling flash, the Chinaman vanished in an instant, and, as I reached the glass, my own reflection faced me.

I turned back into the room pretty completely enlightened, and looked at Calverley with a new-born distaste. He still sat facing the bewildered lawyer, one moment sobbing convulsively, the next yelping with hysterical laughter. He was not an agreeable spectacle, and when, a few moments later, Thorndyke entered the room, and halted by the door with a stare of disgust, I was moved to join him. But at this juncture a man pushed past Thorndyke, and, striding up to Calverley, shook him roughly by the arm.

“Stop that row!” he exclaimed furiously. “Do you hear? Stop it!”

“I can’t help it, Raggerton,” gasped Calverley. “He gave me such a turn—the mandarin, you know.”

“What!” ejaculated Raggerton.

He dashed across to the closet, looked in, and turned upon Calverley with a snarl. Then he walked out of the room.

“Brodribb,” said Thorndyke, “I should like to have a word with you and Jervis outside.” Then, as we followed him out on to the landing, he continued: “I have something rather interesting to show you. It is in here.”

He softly opened an adjoining door, and we looked into a small unfurnished room. A projecting closet occupied one side of it, and at the door of the closet stood Captain Raggerton, with his hand upon the key. He turned upon us fiercely, though with a look of alarm, and demanded:

“What is the meaning of this intrusion? and who the deuce are you? Do you know that this is my private room?”

“I suspected that it was,” Thorndyke replied quietly. “Those will be your properties in the closet, then?”

Raggerton turned pale, but continued to bluster. “Do I understand that you have dared to break into my private closet?” he demanded.

“I have inspected it,” replied Thorndyke, “and I may remark that it is useless to wrench at that key, because I have hampered the lock.”

“The devil you have!” shouted Raggerton.

“Yes; you see, I am expecting a police-officer with a search warrant, so I wished to keep everything intact.”

Raggerton turned livid with mingled fear and rage. He stalked up to Thorndyke with a threatening air, but, suddenly altering his mind, exclaimed, “I must see to this!” and flung out of the room.

Thorndyke took a key from his pocket, and, having locked the door, turned to the closet. Having taken out the key to unhamper the lock with a stout wire, he reinserted it and unlocked the door. As we entered, we found ourselves in a narrow closet, similar to the one in the other room, but darker, owing to the absence of a mirror. A few clothes hung from the pegs, and when Thorndyke had lit a candle that stood on a shelf, we could see more of the details.

“Here are some of the properties,” said Thorndyke. He pointed to a peg from which hung a long, blue silk gown of Chinese make, a mandarin’s cap, with a pigtail attached to it, and a beautifully-made papier-maché mask. “Observe,” said Thorndyke, taking the latter down and exhibiting a label on the inside, marked “Renouard à Paris,” “no trouble has been spared.”

He took off his coat, slipped on the gown, the mask, and the cap, and was, in a moment, in that dim light, transformed into the perfect semblance of a Chinaman.

“By taking a little more time,” he remarked, pointing to a pair of Chinese shoes and a large paper lantern, “the make-up could be rendered more complete; but this seems to have answered for our friend Alfred.”

“But,” said Mr. Brodribb, as Thorndyke shed the disguise, “still, I don’t understand—”

“I will make it clear to you in a moment,” said Thorndyke. He walked to the end of the closet, and, tapping the right-
hand wall, said: "This is the back of the mirror. You see that it is hung on massive well-oiled hinges, and is supported on this large, rubber-tyred castor, which evidently has ball bearings. You observe three black cords running along the wall, and passing through those pulleys above. Now, when I pull this cord, notice what happens."

He pulled one cord firmly, and immediately the mirror swung noiselessly inwards on its great castor, until it stood diagonally across the closet, where it was stopped by a rubber buffer.

"Bless my soul!" exclaimed Mr. Brodribb. "What an extraordinary thing!"

The effect was certainly very strange, for, the mirror being now exactly diagonal to the two closets they appeared to be a single, continuous passage, with a door at either end. On going up to the mirror, we found that the opening which it had occupied was filled by a sheet of plain glass, evidently placed there as a precaution to prevent any person from walking through from one closet into the other, and so discovering the trick.

"It's all very puzzling," said Mr. Brodribb; "I don't clearly understand it now."

"Let us finish here," replied Thorndyke, "and then I will explain. Notice this black curtain. When I pull the second cord, it slides across the closet and cuts off the light. The mirror now reflects nothing into the other closet; it simply appears dark. And now I pull the third cord."

He did so, and the mirror swung noiselessly back into its place.

"There is only one other thing to observe before we go out," said Thorndyke, "and that is this other mirror standing with its face to the wall. This, of course, is the one that Fred Calverley originally saw at the end of the closet; it has since been removed, and the larger swinging glass put in its place. And now," he continued, when we came out into the room, "let me explain the mechanism in detail. It was obvious to me, when I heard poor Fred Calverley's story, that the mirror was 'faked,' and I drew a diagram of the probable arrangement, which turns out to be correct. Here it is." He took a sheet of paper from his pocket and handed it to the lawyer. "There are two sketches. Sketch 1 shows the mirror in its ordinary position, closing the end of the closet. A person standing at A, of course, sees his reflection facing him at, apparently, A 1. Sketch 2 shows the mirror swung across. Now a person standing at A does not see his own reflection at all; but if some other person is standing in the other closet at B, A sees the reflection of B apparently at B 1—that is, in the identical position that his own reflection occupied when the mirror was straight across."

"I see now," said Brodribb; "but who set up this apparatus, and why was it done?"

"Let me ask you a question," said Thorndyke. "Is Alfred Calverley the next-of-kin?"

"No; there is Fred's younger brother. But I may say that Fred has made a will quite recently very much in Alfred's favour."

"There is the explanation, then," said Thorndyke. "These two scoundrels have conspired to drive the poor fellow to suicide, and Raggerton was clearly the leading spirit. He was evidently concocting some story with which to work on poor Fred's superstitions when the mention of the Chinaman on the steamer gave him his cue. He then invented the very picturesque story of the murdered mandarin and the stolen pearl. You remember that these 'visitations' did not begin until after that story had been told, and Fred had been absent from the house on a visit. Evidently, during his absence, Raggerton took down the original mirror, and substituted this swinging arrangement; and at the same time procured the Chinaman's dress and mask from the theatrical property dealers. No doubt he reckoned on being able quietly to remove the swinging glass and other properties and replace the original mirror before the inquest."

"By God!" exclaimed Mr. Brodribb, "it's the most infamous, cowardly plot I have ever heard of. They shall go to gaol for it, the villains, as sure as I am alive."

But in this Mr. Brodribb was mistaken; for immediately on finding themselves detected, the two conspirators had left the house, and by nightfall were safely across the Channel; and the only satisfaction that the lawyer obtained was the setting aside of the will on facts disclosed at the inquest.

As to Thorndyke, he has never to this day forgiven himself for having allowed Fred Calverley to go home to his death.

VII. — THE ALUMINUM DAGGER

THE "urgent call"—the instant, peremptory summons to professional duty—is an experience that appertains to the medical rather than the legal practitioner, and I had supposed, when I abandoned the clinical side of my profession in favour of the forensic, that henceforth I should know it no more; that the interrupted meal, the broken leisure, and the jangle of the night-bell, were things of the past; but in practice it was otherwise. The medical jurist is, so to speak, on the borderland of the two professions, and exposed to the vicissitudes of each calling, and so it happened from time to time that the professional services of my colleague or myself were demanded at a moment's notice. And thus it was in the case that I am about to relate.

The sacred rite of the "tub" had been duly performed, and the freshly-dried person of the present narrator was about to be insinuated into the first instalment of clothing, when a hurried step was heard upon the stair, and the voice of our laboratory assistant, Polton, arose at my colleague's door.
“There’s a gentleman downstairs, sir, who says he must see you instantly on most urgent business. He seems to be in a rare twitter, sir—”

Polton was proceeding to descriptive particulars, when a second and more hurried step became audible, and a strange voice addressed Thorndyke.

“I have come to beg your immediate assistance, sir; a most dreadful thing has happened. A horrible murder has been committed. Can you come with me now?”

“I will be with you almost immediately,” said Thorndyke. “Is the victim quite dead?”

“Quite. Cold and stiff. The police think—”

“Do the police know that you have come for me?” interrupted Thorndyke.

“Yes. Nothing is to be done until you arrive.”

“Very well. I will be ready in a few minutes.”

“And if you would wait downstairs, sir,” Polton added persuasively, “I could help the doctor to get ready.”

With this crafty appeal, he lured the intruder back to the sitting-room, and shortly after stole softly up the stairs with a small breakfast tray, the contents of which he deposited firmly in our respective rooms, with a few timely words on the folly of “undertaking murders on an empty stomach.” Thorndyke and I had meanwhile clothed ourselves with a celerity known only to medical practitioners and quick-change artists, and in a few minutes descended the stairs together, calling in at the laboratory for a few appliances that Thorndyke usually took with him on a visit of investigation.

As we entered the sitting-room, our visitor, who was feverishly pacing up and down, seized his hat with a gasp of relief. “You are ready to come?” he asked. “My carriage is at the door;” and, without waiting for an answer, he hurried out, and rapidly preceded us down the stairs.

The carriage was a roomy brougham, which fortunately accommodated the three of us, and as soon as we had entered and shut the door, the coachman whipped up his horse and drove off at a smart trot.

“I had better give you some account of the circumstances, as we go,” said our agitated friend. “In the first place, my name is Curtis, Henry Curtis; here is my card. Ah! and here is another card, which I should have given you before. My solicitor, Mr. Marchmont, was with me when I made this dreadful discovery, and he sent me to you. He remained in the rooms to see that nothing is disturbed until you arrive.”

“That was wise of him,” said Thorndyke. “But now tell us exactly what has occurred.”

“I will,” said Mr. Curtis. “The murdered man was my brother-in-law, Alfred Hartridge, and I am sorry to say he was—well, he was a bad man. It grieves me to speak of him thus—de mortuis, you know—but, still, we must deal with the facts, even though they be painful.”

“Undoubtedly,” agreed Thorndyke.

“I have had a great deal of very unpleasant correspondence with him—Marchmont will tell you about that—and yesterday I left a note for him, asking for an interview, to settle the business, naming eight o’clock this morning as the hour, because I had to leave town before noon. He replied, in a very singular letter, that he would see me at that hour, and Mr. Marchmont very kindly consented to accompany me. Accordingly, we went to his chambers together this morning, arriving punctually at eight o’clock. We rang the bell several times, and knocked loudly at the door, but as there was no response, we went down and spoke to the hall-porter. This man, it seems, had already noticed, from the courtyard, that the electric lights were full on in Mr. Hartridge’s sitting-room, as they had been all night, according to the statement of the night-porter; so now, suspecting that something was wrong, he came up with us, and rang the bell and battered at the door. Then, as there was still no sign of life within, he inserted his duplicate key and tried to open the door—unsuccessfully, however, as it proved to be bolted on the inside. Thereupon the porter fetched a constable, and, after a consultation, we decided that we were justified in breaking open the door; the porter produced a crowbar, and by our unified efforts the door was eventually burst open. We entered, and—my God! Dr. Thorndyke, what a terrible sight it was that met our eyes! My brother-in-law was lying dead on the floor of the sitting-room. He had been stabbed—stabbed to death; and the dagger had not even been withdrawn. It was still sticking out of his back.”

He mopped his face with his handkerchief, and was about to continue his account of the catastrophe when the carriage entered a quiet side-street between Westminster and Victoria, and drew up before a block of tall, new, red-brick buildings. A flurried hall-porter ran out to open the door, and we alighted opposite the main entrance.

“My brother-in-law’s chambers are on the second-floor,” said Mr. Curtis. “We can go up in the lift.”

The porter had hurried before us, and already stood with his hand upon the rope. We entered the lift, and in a few seconds were discharged on to the second floor, the porter, with furtive curiosity, following us down the corridor. At the end of the passage was a half-open door, considerably battered and bruised. Above the door, painted in white lettering, was the inscription, “Mr. Hartridge”; and through the doorway protruded the rather foxy countenance of Inspector Badger.

“I am glad you have come, sir,” said he, as he recognized my colleague. “Mr. Marchmont is sitting inside like a watchdog, and he growls if any of us even walks across the room.”
The words formed a complaint, but there was a certain geniality in the speaker’s manner which made me suspect that Inspector Badger was already navigating his craft on a lee shore.

We entered a small lobby or hall, and from thence passed into the sitting-room, where we found Mr. Marchmont keeping his vigil, in company with a constable and a uniformed inspector. The three rose softly as we entered, and greeted us in a whisper; and then, with one accord, we all looked towards the other end of the room, and so remained for a time without speaking.

There was, in the entire aspect of the room, something very grim and dreadful. An atmosphere of tragic mystery enveloped the most commonplace objects; and sinister suggestions lurked in the most familiar appearances. Especially impressive was the air of suspense—of ordinary, every-day life suddenly arrested—cut short in the twinkling of an eye. The electric lamps, still burning dim and red, though the summer sunshine streamed in through the windows; the half-emptied tumbler and open book by the empty chair, had each its whispered message of swift and sudden disaster, as had the hushed voices and stealthy movements of the waiting men, and, above all, an awesome shape that was but a few hours since a living man, and that now sprawled, prone and motionless, on the floor.

"This is a mysterious affair," observed Inspector Badger, breaking the silence at length, "though it is clear enough up to a certain point. The body tells its own story."

We stepped across and looked down at the corpse. It was that of a somewhat elderly man, and lay, on an open space of floor before the fireplace, face downwards, with the arms extended. The slender hilt of a dagger projected from the back below the left shoulder, and, with the exception of a trace of blood upon the lips, this was the only indication of the mode of death. A little way from the body a clock-key lay on the carpet, and, glancing up at the clock on the mantelpiece, I perceived that the glass front was open.

"You see," pursued the inspector, noting my glance, "he was standing in front of the fireplace, winding the clock. Then the murderer stole up behind him—the noise of the turning key must have covered his movements—and stabbed him. And you see, from the position of the dagger on the left side of the back, that the murderer must have been left-handed. That is all clear enough. What is not clear is how he got in, and how he got out again."

"The body has not been moved, I suppose," said Thorndyke.

"No. We sent for Dr. Egerton, the police-surgeon, and he certified that the man was dead. He will be back presently to see you and arrange about the post-mortem."

"Then," said Thorndyke, "we will not disturb the body till he comes, except to take the temperature and dust the dagger-hilt."

He took from his bag a long, registering chemical thermometer and an insufflator or powder-blower. The former he introduced under the dead man’s clothing against the abdomen, and with the latter blew a stream of fine yellow powder on to the black leather handle of the dagger. Inspector Badger stooped eagerly to examine the handle, as Thorndyke blew away the powder that had settled evenly on the surface.

"No finger-prints," said he, in a disappointed tone. "He must have worn gloves. But that inscription gives a pretty broad hint."

He pointed, as he spoke, to the metal guard of the dagger, on which was engraved, in clumsy lettering, the single word, "TRADITORE."

"That’s the Italian for ‘traitor,’” continued the inspector, “and I got some information from the porter that fits in with that suggestion. We’ll have him in presently, and you shall hear."

"Meanwhile," said Thorndyke, "as the position of the body may be of importance in the inquiry, I will take one or two photographs and make a rough plan to scale. Nothing has been moved, you say? Who opened the windows?"

"They were open when we came in," said Mr. Marchmont. "Last night was very hot, you remember. Nothing whatever has been moved."

Thorndyke produced from his bag a small folding camera, a telescopic tripod, a surveyor’s measuring-tape, a boxwood scale, and a sketch-block. He set up the camera in a corner, and exposed a plate, taking a general view of the room, and including the corpse. Then he moved to the door and made a second exposure.

"Will you stand in front of the clock, Jervis," he said, “and raise your hand as if winding it? Thanks; keep like that while I expose a plate."

I remained thus, in the position that the dead man was assumed to have occupied at the moment of the murder, while the plate was exposed, and then, before I moved, Thorndyke marked the position of my feet with a blackboard chalk. He next set up the tripod over the chalk marks, and took two photographs from that position, and finally photographed the body itself.

The photographic operations being concluded, he next proceeded, with remarkable skill and rapidity, to lay out on the sketch-block a ground-plan of the room, showing the exact position of the various objects, on a scale of a quarter of an inch to the foot—a process that the inspector was inclined to view with some impatience.

“You don’t spare trouble, Doctor,” he remarked; "nor time either," he added, with a significant glance at his watch.
“No,” answered Thorndyke, as he detached the finished sketch from the block; “I try to collect all the facts that may bear on a case. They may prove worthless, or they may turn out of vital importance; one never knows beforehand, so I collect them all. But here, I think, is Dr. Egerton.”

The police-surgeon greeted Thorndyke with respectful cordiality, and we proceeded at once to the examination of the body. Drawing out the thermometer, my colleague noted the reading, and passed the instrument to Dr. Egerton.

“Dead about ten hours,” remarked the latter, after a glance at it. “This was a very determined and mysterious murder.”

“Very,” said Thorndyke. “Feel that dagger, Jervis.”

I touched the hilt, and felt the characteristic grating of bone.

“It is through the edge of a rib!” I exclaimed.

“Yes; it must have been used with extraordinary force. And you notice that the clothing is screwed up slightly, as if the blade had been rotated as it was driven in. That is a very peculiar feature, especially when taken together with the violence of the blow.”

“It is singular, certainly,” said Dr. Egerton, “though I don’t know that it helps us much. Shall we withdraw the dagger before moving the body?”

“Certainly,” replied Thorndyke, “or the movement may produce fresh injuries. But wait.” He took a piece of string from his pocket, and, having drawn the dagger out a couple of inches, stretched the string in a line parallel to the flat of the blade. Then, giving me the ends to hold, he drew the weapon out completely. As the blade emerged, the twist in the clothing disappeared. “Observe,” said he, “that the string gives the direction of the wound, and that the cut in the clothing no longer coincides with it. There is quite a considerable angle, which is the measure of the rotation of the blade.”

“Yes, it is odd,” said Dr. Egerton, “though, as I said, I doubt that it helps us.”

“At present,” Thorndyke rejoined dryly, “we are noting the facts.”

“Quite so,” agreed the other, reddening slightly; “and perhaps we had better move the body to the bedroom, and make a preliminary inspection of the wound.”

We carried the corpse into the bedroom, and, having examined the wound without eliciting anything new, covered the remains with a sheet, and returned to the sitting-room.

“Well, gentlemen,” said the inspector, “you have examined the body and the wound, and you have measured the floor and the furniture, and taken photographs, and made a plan, but we don’t seem much more forward. Here’s a man murdered in his rooms. There is only one entrance to the flat, and that was bolted on the inside at the time of the murder. The windows are some forty feet from the ground; there is no rain-pipe near any of them; they are set flush in the wall, and there isn’t a foothold for a fly on any part of that wall. The grates are modern, and there isn’t room for a good-sized cat to crawl up any of the chimneys. Now, the question is, How did the murderer get in, and how did he get out again?”

“Still,” said Mr. Marchmont, “the fact is that he did get in, and that he is not here now; and therefore he must have got out; and therefore it must have been possible for him to get out. And, further, it must be possible to discover how he got out.”

The inspector smiled sourly, but made no reply.

“The circumstances,” said Thorndyke, “appear to have been these: The deceased seems to have been alone; there is no trace of a second occupant of the room, and only one half-emptied tumbler on the table. He was sitting reading when apparently he noticed that the clock had stopped—at ten minutes to twelve; he laid his book, face downwards, on the table, and rose to wind the clock, and as he was winding it he met his death.”

“By a stab dealt by a left-handed man, who crept up behind him on tiptoe,” added the inspector.

Thorndyke nodded. “That would seem to be so,” he said. “But now let us call in the porter, and hear what he has to tell us.”

The custodian was not difficult to find, being, in fact, engaged at that moment in a survey of the premises through the slit of the letter-box.

“Do you know what persons visited these rooms last night?” Thorndyke asked him, when he entered looking somewhat sheepish.

“A good many were in and out of the building,” was the answer, “but I can’t say if any of them came to this flat. I saw Miss Curtis pass in about nine.”

“My daughter!” exclaimed Mr. Curtis, with a start. “I didn’t know that.”

“She left about nine-thirty,” the porter added.

“Do you know what she came about?” asked the inspector.

“I can guess,” replied Mr. Curtis.

“Then don’t say,” interrupted Mr. Marchmont. “Answer no questions.”
“You’re very close, Mr. Marchmont,” said the inspector; “we are not suspecting the young lady. We don’t ask, for instance, if she is left-handed.”

He glanced craftily at Mr. Curtis as he made this remark, and I noticed that our client suddenly turned deathly pale, whereupon the inspector looked away again quickly, as though he had not observed the change.

“Tell us about those Italians again,” he said, addressing the porter. “When did the first of them come here?”

“About a week ago,” was the reply. “He was a common-looking man—looked like an organ-grinder—and he brought a note to my lodge. It was in a dirty envelope, and was addressed ‘Mr. Hartridge, Esq., Brackenhurst Mansions,’ in a very bad handwriting. The man gave me the note and asked me to give it to Mr. Hartridge; then he went away, and I took the note up and dropped it into the letter-box.”

“What happened next?”

“Why, the very next day an old hag of an Italian woman—one of them fortune-telling swines with a cage of birds on a stand—came and set up just by the main doorway. I soon sent her packing, but, bless you! she was back again in ten minutes, birds and all. I sent her off again—I kept on sending her off, and she kept on coming back, until I was reg’lar wore to a thread.”

“You seem to have picked up a bit since then,” remarked the inspector with a grin and a glance at the sufferer’s very pronounced bow-window.

“Perhaps I have,” the custodian replied haughtily. “Well, the next day there was a ice-cream man—a reg’lar waster, he was. Stuck outside as if he was froze to the pavement. Kept giving the errand-boys tasters, and when I tried to move him on, he told me not to obstruct his business. Business, indeed! Well, there them boys stuck, one after the other, wiping their tongues round the bottoms of them glasses, until I was fit to bust with aggravation. And he kept me going all day.

“Then, the day after that there was a barrel-organ, with a mangy-looking monkey on it. He was the worst of all. Profane, too, he was. Kept mixing up sacred tunes and comic songs: ‘Rock of Ages,’ ‘Bill Bailey,’ ‘Cujus Animal,’ and ‘Over the Garden Wall.’ And when I tried to move him on, that little blighter of a monkey made a run at my leg; and then the man grinned and started playing, ‘Wait till the Clouds roll by.’ I tell you, it was fair sickening.”

He wiped his brow at the recollection, and the inspector smiled appreciatively.

“And that was the last of them?” said the latter; and as the porter nodded sulkily, he asked: “Should you recognize the note that the Italian gave you?”

“I should,” answered the porter with frosty dignity.

The inspector bustled out of the room, and returned a minute later with a letter-case in his hand.

“This was in his breast-pocket,” said he, laying the bulging case on the table, and drawing up a chair. “Now, here are three letters tied together. Ah! this will be the one.” He untied the tape, and held out a dirty envelope addressed in a sprawling, illiterate hand to “Mr. Hartridge, Esq.” “Is that the note the Italian gave you?”

The porter examined it critically. “Yes,” said he; “that is the one.”

The inspector drew the letter out of the envelope, and, as he opened it, his eyebrows went up.

“What do you make of that, Doctor?” he said, handing the sheet to Thorndyke.

Thorndyke regarded it for a while in silence, with deep attention. Then he carried it to the window, and, taking his lens from his pocket, examined the paper closely, first with the low power, and then with the highly magnifying Coddington attachment.

“I should have thought you could see that with the naked eye,” said the inspector, with a sly grin at me. “It’s a pretty bold design.”

“Yes,” replied Thorndyke; “a very interesting production. What do you say, Mr. Marchmont?”

The solicitor took the note, and I looked over his shoulder. It was certainly a curious production. Written in red ink, on the commonest notepaper, and in the same sprawling hand as the address, was the following message: “You are given six days to do what is just. By the sign above, know what to expect if you fail.” The sign referred to was a skull and crossbones, very neatly, but rather unskillfully, drawn at the top of the paper.

“This,” said Mr. Marchmont, handing the document to Mr. Curtis, “explains the singular letter that he wrote yesterday. You have it with you, I think?”

“Yes,” replied Mr. Curtis; “here it is.”

He produced a letter from his pocket, and read aloud:

“Yes: come if you like, though it is an ungodly hour. Your threatening letters have caused me great amusement. They are worthy of Sadler’s Wells in its prime.

"ALFRED HARTRIDGE."
"Was Mr. Hartridge ever in Italy?" asked Inspector Badger.

"Oh yes," replied Mr. Curtis. "He stayed at Capri nearly the whole of last year."

"Why, then, that gives us our clue. Look here. Here are these two other letters; E.C. postmark—Saffron Hill is E.C. And just look at that!"

He spread out the last of the mysterious letters, and we saw that, besides the *memento mori*, it contained only three words: "Beware! Remember Capri!"

"If you have finished, Doctor, I'll be off and have a look round Little Italy. Those four Italians oughtn't to be difficult to find, and we've got the porter here to identify them."

"Before you go," said Thorndyke, "there are two little matters that I should like to settle. One is the dagger: it is in your pocket, I think. May I have a look at it?"

The inspector rather reluctantly produced the dagger and handed it to my colleague.

"A very singular weapon, this," said Thorndyke, regarding the dagger thoughtfully, and turning it about to view its different parts. "Singular both in shape and material. I have never seen an aluminium hilt before, and bookbinder's morocco is a little unusual."

"The aluminium was for lightness," explained the inspector, "and it was made narrow to carry up the sleeve, I expect."

"Perhaps so," said Thorndyke.

He continued his examination, and presently, to the inspector's delight, brought forth his pocket lens.

"I never saw such a man!" exclaimed the jocose detective. "His motto ought to be, 'We magnify thee.' I suppose he'll measure it next."

The inspector was not mistaken. Having made a rough sketch of the weapon on his block, Thorndyke produced from his bag a folding rule and a delicate calliper-gauge. With these instruments he proceeded, with extraordinary care and precision, to take the dimensions of the various parts of the dagger, entering each measurement in its place on the sketch, with a few brief, descriptive details.

"The other matter," said he at length, handing the dagger back to the inspector, "refers to the houses opposite."

He walked to the window, and looked out at the backs of a row of tall buildings similar to the one we were in. They were about thirty yards distant, and were separated from us by a piece of ground, planted with shrubs and intersected by gravel paths.

"If any of those rooms were occupied last night," continued Thorndyke, "we might obtain an actual eyewitness of the crime. This room was brilliantly lighted, and all the blinds were up, so that an observer at any of those windows could see right into the room, and very distinctly, too. It might be worth inquiring into."

"Yes, that's true," said the inspector; "though I expect, if any of them have seen anything, they will come forward quick enough when they read the report in the papers. But I must be off now, and I shall have to lock you out of the rooms."

As we went down the stairs, Mr. Marchmont announced his intention of calling on us in the evening, "unless," he added, "you want any information from me now."

"I do," said Thorndyke. "I want to know who is interested in this man's death."

"That," replied Marchmont, "is rather a queer story. Let us take a turn in that garden that we saw from the window. We shall be quite private there."

He beckoned to Mr. Curtis, and, when the inspector had departed with the police-surgeon, we induced the porter to let us into the garden.

"The question that you asked," Mr. Marchmont began, looking up curiously at the tall houses opposite, "is very simply answered. The only person immediately interested in the death of Alfred Hartridge is his executor and sole legatee, a man named Leonard Wolfe. He is no relation of the deceased, merely a friend, but he inherits the entire estate—about twenty thousand pounds. The circumstancies are these: Alfred Hartridge was the eldest of two brothers, of whom the younger, Charles, died before his father, leaving a widow and three children. Fifteen years ago the father died, leaving the whole of his property to Alfred, with the understanding that he should support his brother's family and make the children his heirs."

"Was there no will?" asked Thorndyke.

"Under great pressure from the friends of his son's widow, the old man made a will shortly before he died; but he was then very old and rather childish, so the will was contested by Alfred, on the grounds of undue influence, and was ultimately set aside. Since then Alfred Hartridge has not paid a penny towards the support of his brother's family. If it had not been for my client, Mr. Curtis, they might have starved; the whole burden of the support of the widow and the education of the children has fallen upon him.

"Well, just lately the matter has assumed an acute form, for two reasons. The first is that Charles's eldest son, Edmund, has come of age. Mr. Curtis had him articled to a solicitor, and, as he is now fully qualified, and a most advantageous proposal for a partnership has been made, we have been putting pressure on Alfred to supply the necessary capital in
accordance with his father's wishes. This he had refused to do, and it was with reference to this matter that we were calling on him this morning. The second reason involves a curious and disgraceful story. There is a certain Leonard Wolfe, who has been an intimate friend of the deceased. He is, I may say, a man of bad character, and their association has been of a kind creditable to neither. There is also a certain woman named Hester Greene, who had certain claims upon the deceased, which we need not go into at present. Now, Leonard Wolfe and the deceased, Alfred Hartridge, entered into an agreement, the terms of which were these: (1) Wolfe was to marry Hester Greene, and in consideration of this service (2) Alfred Hartridge was to assign to Wolfe the whole of his property, absolutely, the actual transfer to take place on the death of Hartridge."

"And has this transaction been completed?" asked Thorndyke.

"Yes, it has, unfortunately. But we wished to see if anything could be done for the widow and the children during Hartridge's lifetime. No doubt, my client's daughter, Miss Curtis, called last night on a similar mission—very indiscreetly, since the matter was in our hands; but, you know, she is engaged to Edmund Hartridge—and I expect the interview was a pretty stormy one."

Thorndyke remained silent for a while, pacing slowly along the gravel path, with his eyes bent on the ground: not abstractedly, however, but with a searching, attentive glance that roved amongst the shrubs and bushes, as though he were looking for something.

"What sort of man," he asked presently, "is this Leonard Wolfe? Obviously he is a low scoundrel, but what is he like in other respects? Is he a fool, for instance?"

"Not at all, I should say," said Mr. Curtis. "He was formerly an engineer, and, I believe, a very capable mechanician. Latterly he has lived on some property that came to him, and has spent both his time and his money in gambling and dissipation. Consequently, I expect he is pretty short of funds at present."

"And in appearance?"

"I only saw him once," replied Mr. Curtis, "and all I can remember of him is that he is rather short, fair, thin, and clean-shaven, and that he has lost the middle finger of his left hand."

"And he lives at?"

"Eltham, in Kent. Morton Grange, Eltham," said Mr. Marchmont. "And now, if you have all the information that you require, I must really be off, and so must Mr. Curtis."

The two men shook our hands and hurried away, leaving Thorndyke gazing meditatively at the dingy flower-beds.

"A strange and interesting case, this, Jervis," said he, stooping to peer under a laurel-bush. "The inspector is on a hot scent—a most palpable red herring on a most obvious string; but that is his business. Ah, here comes the porter, intent, no doubt, on pumping us, whereas—" He smiled genially at the approaching custodian, and asked: "Where did you say those houses fronted?"

"Cotman Street, sir," answered the porter. "They are nearly all offices."

"And the numbers? That open second-floor window, for instance?"

"That is number six; but the house opposite Mr. Hartridge's rooms is number eight."

"Thank you."

Thorndyke was moving away, but suddenly turned again to the porter.

"By the way," said he, "I dropped something out of the window just now—a small flat piece of metal, like this." He made on the back of his visiting card a neat sketch of a circular disc, with a hexagonal hole through it, and handed the card to the porter. "I can't say where it fell," he continued; "these flat things scale about so; but you might ask the gardener to look for it. I will give him a sovereign if he brings it to my chambers, for, although it is of no value to anyone else, it is of considerable value to me."

The porter touched his hat briskly, and as we turned out at the gate, I looked back and saw him already wading among the shrubs.

The object of the porter's quest gave me considerable mental occupation. I had not seen Thorndyke drop any thing, and it was not his way to finger carelessly any object of value. I was about to question him on the subject, when, turning sharply round into Cotman Street, he drew up at the doorway of number six, and began attentively to read the names of the occupants.

"Third-floor," he read out, "Mr. Thomas Barlow, Commission Agent.' Hum! I think we will look in on Mr. Barlow."

He stepped quickly up the stone stairs, and I followed, until we arrived, somewhat out of breath, on the third-floor. Outside the Commission Agent's door he paused for a moment, and we both listened curiously to an irregular sound of shuffling feet from within. Then he softly opened the door and looked into the room. After remaining thus for nearly a minute, he looked round at me with a broad smile, and noiselessly set the door wide open. Inside, a lanky youth of fourteen was practising, with no mean skill, the manipulation of an appliance known by the appropriate name of diabolo; and so absorbed was he in his occupation that we entered and shut the door without being observed. At length the shuttle missed
the string and flew into a large waste-paper basket; the boy turned and confronted us, and was instantly covered with confusion.

"Allow me," said Thorndyke, rooting rather unnecessarily in the waste-paper basket, and handing the toy to its owner. "I need not ask if Mr. Barlow is in," he added, "nor if he is likely to return shortly."

"He won't be back to-day," said the boy, perspiring with embarrassment; "he left before I came. I was rather late."

"I see," said Thorndyke. "The early bird catches the worm, but the late bird catches the diabolo. How did you know he would not be back?"

"He left a note. Here it is."

He exhibited the document, which was neatly written in red ink. Thorndyke examined it attentively, and then asked:

"Did you break the inkstand yesterday?"

The boy stared at him in amazement. "Yes, I did," he answered. "How did you know?"

"I didn't, or I should not have asked. But I see that he has used his stylo to write this note."

The boy regarded Thorndyke distrustfully, as he continued:

"I really called to see if your Mr. Barlow was a gentleman whom I used to know; but I expect you can tell me. My friend was tall and thin, dark, and clean-shaved."

"This ain't him, then," said the boy. "He's thin, but he ain't tall or dark. He's got a sandy beard, and he wears spectacles and a wig. I know a wig when I see one," he added cunningly, "cause my father wears one. He puts it on a peg to comb it, and he swears at me when I larf."

"My friend had injured his left hand," pursued Thorndyke.

"I dunno about that," said the youth. "Mr. Barlow nearly always wears gloves; he always wears one on his left hand, anyhow."

"Ah well! I'll just write him a note on the chance, if you will give me a piece of notepaper. Have you any ink?"

"There's some in the bottle. I'll dip the pen in for you."

He produced, from the cupboard, an opened packet of cheap notepaper and a packet of similar envelopes, and, having dipped the pen to the bottom of the ink-bottle, handed it to Thorndyke, who sat down and hastily scribbled a short note. He had folded the paper, and was about to address the envelope, when he appeared suddenly to alter his mind.

"I don't think I will leave it, after all," he said, slipping the folded paper into his pocket. "No. Tell him I called—Mr. Horace Budge—and say I will look in again in a day or two."

The youth watched our exit with an air of perplexity, and he even came out on to the landing, the better to observe us over the balusters; until, unexpectedly catching Thorndyke's eye, he withdrew his head with remarkable suddenness, and retired in disorder.

To tell the truth, I was now little less perplexed than the office-boy by Thorndyke's proceedings; in which I could discover no relevancy to the investigation that I presumed he was engaged upon: and the last straw was laid upon the burden of my curiosity when he stopped at a staircase window, drew the note out of his pocket, examined it with his lens, held it up to the light, and chuckled aloud.

"Luck," he observed, "though no substitute for care and intelligence, is a very pleasant addition. Really, my learned brother, we are doing uncommonly well."

When we reached the hall, Thorndyke stopped at the housekeeper's box, and looked in with a genial nod.

"I have just been up to see Mr. Barlow," said he. "He seems to have left quite early."

"Yes, sir," the man replied. "He went away about half-past eight."

"That was very early; and presumably he came earlier still?"

"I suppose so," the man assented, with a grin; "but I had only just come on when he left."

"Had he any luggage with him?"

"Yes, sir. There was two cases, a square one and a long, narrow one, about five foot long. I helped him to carry them down to the cab."

"Which was a four-wheeler, I suppose?"

"Yes, sir."

"Mr. Barlow hasn't been here very long, has he?" Thorndyke inquired.

"No. He only came in last quarter-day—about six weeks ago."

"Ah well! I must call another day. Good-morning;" and Thorndyke strode out of the building, and made directly for the
cab-rank in the adjoining street. Here he stopped for a minute or two to parley with the driver of a four-wheeled cab, whom he finally commissioned to convey us to a shop in New Oxford Street. Having dismissed the cabman with his blessing and a half-sovereign, he vanished into the shop, leaving me to gaze at the lathes, drills, and bars of metal displayed in the window. Presently he emerged with a small parcel, and explained, in answer to my inquiring look: "A strip of tool steel and a block of metal for Polton."

His next purchase was rather more eccentric. We were proceeding along Holborn when his attention was suddenly arrested by the window of a furniture shop, in which was displayed a collection of obsolete French small-arms—relics of the tragedy of 1870—which were being sold for decorative purposes. After a brief inspection, he entered the shop, and shortly reappeared carrying a long sword-bayonet and an old Chassepôt rifle.

"What may be the meaning of this martial display?" I asked, as we turned down Fetter Lane.

"House protection," he replied promptly. "You will agree that a discharge of musketry, followed by a bayonet charge, would disconcert the boldest of burglars."

I laughed at the absurd picture thus drawn of the strenuous house-protector, but nevertheless continued to speculate on the meaning of my friend's eccentric proceedings, which I felt sure were in some way related to the murder in Brackenhurst Chambers, though I could not trace the connection.

After a late lunch, I hurried out to transact such of my business as had been interrupted by the stirring events of the morning, leaving Thorndyke busy with a drawing-board, squares, scale, and compasses, making accurate, scaled drawings from his rough sketches; while Polton, with the brown-paper parcel in his hand, looked on at him with an air of anxious expectation.

As I was returning homeward in the evening by way of Mitre Court, I overtook Mr. Marchmont, who was also bound for our chambers, and we walked on together.

"I had a note from Thorndyke," he explained, "asking for a specimen of handwriting, so I thought I would bring it along myself, and hear if he has any news."

When we entered the chambers, we found Thorndyke in earnest consultation with Polton, and on the table before them I observed, to my great surprise, the dagger with which the murder had been committed.

"The Aluminium Dagger.

"I have got you the specimen that you asked for," said Marchmont. "I didn't think I should be able to, but, by a lucky chance, Curtis kept the only letter he ever received from the party in question."

He drew the letter from his wallet, and handed it to Thorndyke, who looked at it attentively and with evident satisfaction.

"By the way," said Marchmont, taking up the dagger, "I thought the inspector took this away with him."

"He took the original," replied Thorndyke. "This is a duplicate, which Polton has made, for experimental purposes, from my drawings."

"Really!" exclaimed Marchmont, with a glance of respectful admiration at Polton; "it is a perfect replica—and you have made it so quickly, too."

"It was quite easy to make," said Polton, "to a man accustomed to work in metal."

"Which," added Thorndyke, "is a fact of some evidential value."

At this moment a hansom drew up outside. A moment later flying footsteps were heard on the stairs. There was a furious battering at the door, and, as Polton threw it open, Mr. Curtis burst wildly into the room.

"Here is a frightful thing, Marchmont!" he gasped. "Edith—my daughter—arrested for the murder. Inspector Badger came to our house and took her. My God! I shall go mad!"

Thorndyke laid his hand on the excited man's shoulder. "Don't distress yourself, Mr. Curtis," said he. "There is no occasion, I assure you. I suppose," he added, "your daughter is left-handed?"

"Yes, she is, by a most disastrous coincidence. But what are we to do? Good God! Dr. Thorndyke, they have taken her to prison—to prison—think of it! My poor Edith!"

"We'll soon have her out," said Thorndyke. "But listen; there is someone at the door."

A brisk rat-tat confirmed his statement; and when I rose to open the door, I found myself confronted by Inspector Badger. There was a moment of extreme awkwardness, and then both the detective and Mr. Curtis proposed to retire in favour of the other.

"Don't go, inspector," said Thorndyke; "I want to have a word with you. Perhaps Mr. Curtis would look in again, say, in
an hour. Will you? We shall have news for you by then, I hope.”

Mr. Curtis agreed hastily, and dashed out of the room with his characteristic impetuosity. When he had gone, Thorndyke turned to the detective, and remarked dryly:

“You seem to have been busy, inspector?”

“Yes,” replied Badger; “I haven’t let the grass grow under my feet; and I’ve got a pretty strong case against Miss Curtis already. You see, she was the last person seen in the company of the deceased; she had a grievance against him; she is left-handed, and you remember that the murder was committed by a left-handed person.”

“Anything else?”

“Yes. I have seen those Italians, and the whole thing was a put-up job. A woman, in a widow’s dress and veil, paid them to go and play the fool outside the building, and she gave them the letter that was left with the porter. They haven’t identified her yet, but she seems to agree in size with Miss Curtis.”

“And how did she get out of the chambers, with the door bolted on the inside?”

“Ah, there you are! That’s a mystery at present—unless you can give us an explanation.” The inspector made this qualification with a faint grin, and added: “As there was no one in the place when we broke into it, the murderer must have got out somehow. You can’t deny that.”

“I do deny it, nevertheless,” said Thorndyke. “You look surprised,” he continued (which was undoubtedly true), “but yet the whole thing is exceedingly obvious. The explanation struck me directly I looked at the body. There was evidently no practicable exit from the flat, and there was certainly no one in it when you entered. Clearly, then, the murderer had never been in the place at all.”

“I don’t follow you in the least,” said the inspector.

“Well,” said Thorndyke, “as I have finished with the case, and am handing it over to you, I will put the evidence before you seriatim. Now, I think we are agreed that, at the moment when the blow was struck, the deceased was standing before the fireplace, winding the clock. The dagger entered obliquely from the left, and, if you recall its position, you will remember that its hilt pointed directly towards an open window.”

“Which was forty feet from the ground.”

“Yes. And now we will consider the very peculiar character of the weapon with which the crime was committed.”

He had placed his hand upon the knob of a drawer, when we were interrupted by a knock at the door. I sprang up, and, opening it, admitted no less a person than the porter of Brackenhurst Chambers. The man looked somewhat surprised on recognizing our visitors, but advanced to Thorndyke, drawing a folded paper from his pocket.

“I’ve found the article you were looking for, sir,” said he, “and a rare hunt I had for it. It had stuck in the leaves of one of their shrubs.”

Thorndyke opened the packet, and, having glanced inside, laid it on the table.

“Thank you,” said he, pushing a sovereign across to the gratified official. “The inspector has your name, I think?”

“He have, sir,” replied the porter; and, pocketing his fee, he departed, beaming.

“To return to the dagger,” said Thorndyke, opening the drawer. “It was a very peculiar one, as I have said, and as you will see from this model, which is an exact duplicate.” Here he exhibited Polton’s production to the astonished detective. “You see that it is extraordinarily slender, and free from projections, and of unusual materials. You also see that it was obviously not made by an ordinary dagger-maker; that, in spite of the Italian word scrawled on it, there is plainly written all over it ‘British mechanic.’ The blade is made from a strip of common three-quarter-inch tool steel; the hilt is turned from an aluminium rod; and there is not a line of engraving on it that could not be produced in a lathe by any engineer’s apprentice. Even the boss at the top is mechanical, for it is just like an ordinary hexagon nut. Then, notice the dimensions, as shown on my drawing. The parts A and B, which just project beyond the blade, are exactly similar in diameter—and such exactness could hardly be accidental. They are each parts of a circle having a diameter of 10.9 millimetres—a dimension which happens, by a singular coincidence, to be exactly the calibre of the old Chassepôt rifle, specimens of which are now on sale at several shops in London. Here is one, for instance.”

He fetched the rifle that he had bought, from the corner in which it was standing, and, lifting the dagger by its point, slipped the hilt into the muzzle. When he let go, the dagger slid quietly down the barrel, until its hilt appeared in the open breech.

“Good God!” exclaimed Marchmont. “You don’t suggest that the dagger was shot from a gun?”

“I do, indeed; and you now see the reason for the aluminium hilt—to diminish the weight of the already heavy projectile—and also for this hexagonal boss on the end?”

“No, I do not,” said the inspector; “but I say that you are suggesting an impossibility.”

“Then,” replied Thorndyke, “I must explain and demonstrate. To begin with, this projectile had to travel point foremost; therefore it had to be made to spin—and it certainly was spinning when it entered the body, as the clothing and the wound
showed us. Now, to make it spin, it had to be fired from a rifled barrel; but as the hilt would not engage in the rifling, it had to be fitted with something that would. That something was evidently a soft metal washer, which fitted on to this hexagon, and which would be pressed into the grooves of the rifling, and so spin the dagger, but would drop off as soon as the weapon left the barrel. Here is such a washer, which Polton has made for us.”

He laid on the table a metal disc, with a hexagonal hole through it.

“This is all very ingenious,” said the inspector, “but I say it is impossible and fantastic.”

“It certainly sounds rather improbable,” Marchmont agreed.

“We will see,” said Thorndyke. “Here is a makeshift cartridge of Polton’s manufacture, containing an eighth charge of smokeless powder for a 20-bore gun.”

He fitted the washer on to the boss of the dagger in the open breech of the rifle, pushed it into the barrel, inserted the cartridge, and closed the breech. Then, opening the office-door, he displayed a target of padded strawboard against the wall.

“The length of the two rooms,” said he, “gives us a distance of thirty-two feet. Will you shut the windows, Jervis?”

I complied, and he then pointed the rifle at the target. There was a dull report—much less loud than I had expected—and when we looked at the target, we saw the dagger driven in up to its hilt at the margin of the bull’s-eye.

“You see,” said Thorndyke, laying down the rifle, “that the thing is practicable. Now for the evidence as to the actual occurrence. First, on the original dagger there are linear scratches which exactly correspond with the grooves of the rifling. Then there is the fact that the dagger was certainly spinning from left to right—in the direction of the rifling, that is—when it entered the body. And then there is this, which, as you heard, the porter found in the garden.”

He opened the paper packet. In it lay a metal disc, perforated by a hexagonal hole. Stepping into the office, he picked up from the floor the washer that he had put on the dagger, and laid it on the paper beside the other. The two discs were identical in size, and the margin of each was indented with identical markings, corresponding to the rifling of the barrel.

The inspector gazed at the two discs in silence for a while; then, looking up at Thorndyke, he said:

“I give in, Doctor. You’re right, beyond all doubt; but how you came to think of it beats me into fits. The only question now is, Who fired the gun, and why wasn’t the report heard?”

“As to the latter,” said Thorndyke, “it is probable that he used a compressed-air attachment, not only to diminish the noise, but also to prevent any traces of the explosive from being left on the dagger. As to the former, I think I can give you the murderer’s name; but we had better take the evidence in order. You may remember,” he continued, “that when Dr. Jervis stood as if winding the clock, I chalked a mark on the floor where he stood. Now, standing on that marked spot, and looking out of the open window, I could see two of the windows of a house nearly opposite. They were the second- and third-floor windows of No. 6, Cotman Street. The second-floor is occupied by a firm of architects; the third-floor by a commission agent named Thomas Barlow. I called on Mr. Barlow, but before describing my visit, I will refer to another matter. You haven’t those threatening letters about you, I suppose?”

“Yes, I have,” said the inspector; and he drew forth a wallet from his breast-pocket.

“Let us take the first one, then,” said Thorndyke. “You see that the paper and envelope are of the very commonest, and the writing illiterate. But the ink does not agree with this. Illiterate people usually buy their ink in penny bottles. Now, this envelope is addressed with Draper’s dichroic ink—a superior office ink, sold only in large bottles—and the red ink in which the note is written is an unfixed, scarlet ink, such as is used by draughtsmen, and has been used, as you can see, in a stylographic pen. But the most interesting thing about this letter is the design drawn at the top. In an artistic sense, the man could not draw, but the anatomical details of the skull are ridiculous. Yet the drawing is very neat. It has the clean, wiry line of a machine drawing, and is done with a steady, practised hand. It is also perfectly symmetrical; the skull, for instance, is exactly in the centre, and, when we examine it through a lens, we see why it is so, for we discover traces of a pencilled centre-line and ruled cross-lines. Moreover, the lens reveals a tiny particle of draughtsmen’s soft, red, rubber, with which the pencil lines were taken out; and all these facts, taken together, suggest that the drawing was made by someone accustomed to making accurate mechanical drawings. And now we will return to Mr. Barlow. He was out when I called, but I took the liberty of glancing round the office, and this is what I saw. On the mantelshelf was a twelve-inch flat boxwood rule, such as engineers use, a piece of soft, red rubber, and a stone bottle of Draper’s dichroic ink. I obtained, by a simple ruse, a specimen of the office notepaper and the ink. We will examine it presently. I found that Mr. Barlow is a new tenant, that he is rather short, wears a wig and spectacles, and always wears a glove on his left hand. He left the office at 8.30 this morning, and no one saw him arrive. He had with him a square case, and a narrow, oblong one about five feet in length; and he took a cab to Victoria, and apparently caught the 8.51 train to Chatham.”

“Ah!” exclaimed the inspector.

“But,” continued Thorndyke, “now examine those three letters, and compare them with this note that I wrote in Mr. Barlow’s office. You see that the paper is of the same make, with the same water-mark, but that is of no great significance. What is of crucial importance is this: You see, in each of these letters, two tiny indentations near the bottom corner. Somebody has used compasses or drawing-pins over the packet of notepaper, and the points have made little indentations, which have marked several of the sheets. Now, notepaper is cut to its size after it is folded, and if you stick a pin into the
top sheet of a section, the indentations on all the underlying sheets will be at exactly similar distances from the edges and corners of the sheet. But you see that these little dents are all at the same distance from the edges and the corner." He demonstrated the fact with a pair of compasses. "And now look at this sheet, which I obtained at Mr. Barlow's office. There are two little indentations—rather faint, but quite visible—near the bottom corner, and when we measure them with the compasses, we find that they are exactly the same distance apart as the others, and the same distance from the edges and the bottom corner. The irresistible conclusion is that these four sheets came from the same packet."

The inspector started up from his chair, and faced Thorndyke. "Who is this Mr. Barlow?" he asked.

"That," replied Thorndyke, "is for you to determine; but I can give you a useful hint. There is only one person who benefits by the death of Alfred Hartridge, but he benefits to the extent of twenty thousand pounds. His name is Leonard Wolfe, and I learn from Mr. Marchmont that he is a man of indifferent character—a gambler and a spendthrift. By profession he is an engineer, and he is a capable mechanician. In appearance he is thin, short, fair, and clean-shaven, and he has lost the middle finger of his left hand. Mr. Barlow is also short, thin, and fair, but wears a wig, a board, and spectacles, and always wears a glove on his left hand. I have seen the handwriting of both these gentlemen, and should say that it would be difficult to distinguish one from the other."

"That's good enough for me," said the inspector. "Give me his address, and I'll have Miss Curtis released at once."

*****

The same night Leonard Wolfe was arrested at Eltham, in the very act of burying in his garden a large and powerful compressed-air rifle. He was never brought to trial, however, for he had in his pocket a more portable weapon—a large-bore Derringer pistol—with which he managed to terminate an exceedingly ill-spent life.

"And, after all," was Thorndyke's comment, when he heard of the event, "he had his uses. He has relieved society of two very bad men, and he has given us a most instructive case. He has shown us how a clever and ingenious criminal may take endless pains to mislead and delude the police, and yet, by inattention to trivial details, may scatter clues broadcast. We can only say to the criminal class generally, in both respects, 'Go thou and do likewise.'"

VIII. — A MESSAGE FROM THE DEEP SEA

THE Whitechapel Road, though redeemed by scattered relics of a more picturesque past from the utter desolation of its neighbour the Commercial Road, is hardly a gay thoroughfare. Especially at its eastern end, where its sordid modernity seems to reflect the colourless lives of its inhabitants, does its grey and dreary length depress the spirits of the wayfarer. But the longest and dullest road can be made delightful by sprightly discourse seasoned with wit and wisdom, and so it was that, as I walked westward by the side of my friend John Thorndyke, the long, monotonous road seemed all too short.

We had been to the London Hospital to see a remarkable case of acromegaly, and, as we returned, we discussed this curious affection, and the allied condition of gigantism, in all their bearings, from the origin of the "Gibson chin" to the physique of Og, King of Bashan.

"It would have been interesting," Thorndyke remarked as we passed up Aldgate High Street, "to have put one's finger into His Majesty's pituitary fossa—after his decease, of course. By the way, here is Harrow Alley; you remember Defoe's description of the dead-cart waiting out here, and the ghastly procession coming down the alley." He took my arm and led me up the narrow thoroughfare as far as the sharp turn by the "Star and Still" public-house, where we turned to look back.

"I never pass this place," he said musingly, "but I seem to hear the clang of the bell and the dismal cry of the carter—"

He broke off abruptly. Two figures had suddenly appeared framed in the archway, and now advanced at headlong speed. One, who led, was a stout, middle-aged Jewess, very breathless and dishevelled; the other was a well-dressed young man, hardly less agitated than his companion. As they approached, the young man suddenly recognized my colleague, and accosted him in agitated tones.

"I've just been sent for to a case of murder or suicide. Would you mind looking at it for me, sir? It's my first case, and I feel rather nervous."

Here the woman darted back, and plucked the young doctor by the arm.

"Hurry! hurry!" she exclaimed, "don't stop to talk." Her face was as white as lard, and shiny with sweat; her lips twitched, her hands shook, and she stared with the eyes of a frightened child.

"Of course I will come, Hart," said Thorndyke; and, turning back, we followed the woman as she elbowed her way frantically among the foot-passengers.

"Have you started in practice here?" Thorndyke asked as we hurried along.

"No, sir," replied Dr. Hart; "I am an assistant. My principal is the police-surgeon, but he is out just now. It's very good of you to come with me, sir."

"Tut, tut," rejoined Thorndyke. "I am just coming to see that you do credit to my teaching. That looks like the house."

We had followed our guide into a side street, halfway down which we could see a knot of people clustered round a doorway. They watched us as we approached, and drew aside to let us enter. The woman whom we were following rushed
into the passage with the same headlong haste with which she had traversed the streets, and so up the stairs. But as she neared the top of the flight she slowed down suddenly, and began to creep on tiptoe with noiseless and hesitating steps. On the landing she turned to face us, and pointing a shaking forefinger at the door of the back room, whispered almost inaudibly, “She’s in there,” and then sank half-fainting on the bottom stair of the next flight.

I laid my hand on the knob of the door, and looked back at Thorndyke. He was coming slowly up the stairs, closely scrutinizing floor, walls, and handrail as he came. When he reached the landing, I turned the handle, and we entered the room together, closing the door after us. The blind was still down, and in the dim, uncertain light nothing out of the common was, at first, to be seen. The shabby little room looked trim and orderly enough, save for a heap of cast-off feminine clothing piled upon a chair. The bed appeared undisturbed except by the half-seen shape of its occupant, and the quiet face, dimly visible in its shadowy corner, might have been that of a sleeper but for its utter stillness and for a dark stain on the pillow by its side.

Dr. Hart stole on tiptoe to the bedside, while Thorndyke drew up the blind; and as the garish daylight poured into the room, the young surgeon fell back with a gasp of horror.

“Good God!” he exclaimed; “poor creature! But this is a frightful thing, sir!”

The light streamed down upon the white face of a handsome girl of twenty-five, a face peaceful, placid, and beautiful with the austere and almost unearthly beauty of the youthful dead. The lips were slightly parted, the eyes half closed and drowsy, shaded with sweeping lashes; and a wealth of dark hair in massive plaits served as a foil to the translucent skin.

Our friend had drawn back the bedclothes a few inches, and now there was revealed, beneath the comely face, so serene and inescapable, and yet so dreadful in its fixity and waxen pallor, a horrible, yawning wound that almost divided the shapely neck.

Thorndyke looked down with stern pity at the plump white face.

“It was savagely done,” said he, “and yet mercifully, by reason of its very savagery. She must have died without waking.”

“The brute!” exclaimed Hart, clenching his fists and turning crimson with wrath. “The infernal cowardly beast! He shall hang! By God, he shall hang!” In his fury the young fellow shook his fists in the air, even as the moisture welled up into his eyes.

Thorndyke touched him on the shoulder. “That is what we are here for, Hart,” said he. “Get out your notebook;” and with this he bent down over the dead girl.

At the friendly reproof the young surgeon pulled himself together, and, with open notebook, commenced his investigation, while I, at Thorndyke’s request, occupied myself in making a plan of the room, with a description of its contents and their arrangements. But this occupation did not prevent me from keeping an eye on Thorndyke’s movements, and presently I suspended my labours to watch him as, with his pocket-knife, he scraped together some objects that he had found on the pillow.

“What do you make of this?” he asked, as I stepped over to his side. He pointed with the blade to a tiny heap of what looked like silver sand, and, as I looked more closely, I saw that similar particles were sprinkled on other parts of the pillow.

“Silver sand!” I exclaimed. “I don’t understand at all how it can have got there. Do you?”

Thorndyke shook his head. “We will consider the explanation later,” was his reply. He had produced from his pocket a small metal box which he always carried, and which contained such requisites as cover-slips, capillary tubes, moulding wax, and other “diagnostic materials.” He now took from it a seed-envelope, into which he neatly shovelled the little pinch of sand with his knife. He had closed the envelope, and was writing a pencilled description on the outside, when we were startled by a cry from Hart.

“Good God, sir! Look at this! It was done by a woman!”

He had drawn back the bedclothes, and was staring aghast at the dead girl’s left hand. It held a thin tress of long, red hair.

Thorndyke hastily pocketed his specimen, and, stepping round the little bedside table, bent over the hand with knitted brows. It was closed, though not tightly clenched, and when an attempt was made gently to separate the fingers, they were found to be as rigid as the fingers of a wooden hand. Thorndyke stooped yet more closely, and, taking out his lens, scrutinized the wisps of hair throughout its entire length.

“There is more here than meets the eye at the first glance,” he remarked. “What say you, Hart?” He held out his lens to his quondam pupil, who was about to take it from him when the door opened, and three men entered. One was a policeman, the second appeared to be a plain-clothes officer, while the third was evidently the divisional surgeon.

“Friends of yours, Hart?” inquired the latter, regarding us with some disfavour.

Thorndyke gave a brief explanation of our presence to which the newcomer rejoined:

“Well, sir, your locus standi here is a matter for the inspector. My assistant was not authorized to call in outsiders. You needn’t wait, Hart.”
With this he proceeded to his inspection, while Thorndyke withdrew the pocket-thermometer that he had slipped under the body, and took the reading.

The inspector, however, was not disposed to exercise the prerogative at which the surgeon had hinted; for an expert has his uses.

“How long should you say she’d been dead, sir?” he asked affably.

“About ten hours,” replied Thorndyke.

The inspector and the detective simultaneously looked at their watches. “That fixes it at two o’clock this morning,” said the former. “What’s that, sir?”

The surgeon was pointing to the wisp of hair in the dead girl’s hand.

“My word!” exclaimed the inspector. “A woman, eh? She must be a tough customer. This looks like a soft job for you, sergeant.”

“Yes,” said the detective. “That accounts for that box with the hassock on it at the head of the bed. She had to stand on them to reach over. But she couldn’t have been very tall.”

“She must have been mighty strong, though,” said the inspector; “why, she has nearly cut the poor wench’s head off.” He moved round to the head of the bed, and, stooping over, peered down at the gaping wound. Suddenly he began to draw his hand over the pillow, and then rub his fingers together. “Why,” he exclaimed, “there’s sand on the pillow—silver sand! Now, how can that have come there?”

The surgeon and the detective both came round to verify this discovery, and an earnest consultation took place as to its meaning.

“Did you notice it, sir?” the inspector asked Thorndyke.

“Yes,” replied the latter; “it’s an unaccountable thing, isn’t it?”

“I don’t know that it is, either,” said the detective, he ran over to the washstand, and then uttered a grunt of satisfaction.

“It’s quite a simple matter, after all, you see,” he said, glancing complacently at my colleague. “There’s a ball of sand-soap on the washstand, and the basin is full of blood-stained water. You see, she must have washed the blood off her hands, and off the knife, too—a pretty cool customer she must be—and she used the sand-soap. Then, while she was drying her hands, she must have stood over the head of the bed, and let the sand fall on to the pillow. I think that’s clear enough.”

“Admirably clear,” said Thorndyke; “and what do you suppose was the sequence of events?”

The gratified detective glanced round the room. “I take it,” said he, “that the deceased read herself to sleep. There is a book on the table by the bed, and a candlestick with nothing in it but a bit of burnt wick at the bottom of the socket. I imagine that the woman came in quietly, lit the gas, put the box and the hassock at the bedhead, stood on them, and cut her victim’s throat. Deceased must have waked up and clutched the murderess’s hair—though there doesn’t seem to have been much of a struggle; but no doubt she died almost at once. Then the murderess washed her hands, cleaned the knife, tidied up the bed a bit, and went away. That’s about how things happened. I think, but how she got in without anyone hearing, and how she got out, and where she went to, are the things that we’ve got to find out.”

“Perhaps,” said the surgeon, drawing the bedclothes over the corpse, “we had better have the landlady in and make a few inquiries.” He glanced significantly at Thorndyke, and the inspector coughed behind his hand. My colleague, however, chose to be obtuse to these hints: opening the door, he turned the key backwards and forwards several times, drew it out, examined it narrowly, and replaced it.

“The landlady is outside on the landing,” he remarked, holding the door open. Thereupon the inspector went out, and we all followed to hear the result of his inquiries.

“Now, Mrs. Goldstein,” said the officer, opening his notebook, “I want you to tell us all that you know about this affair, and about the girl herself. What was her name?”

The landlady, who had been joined by a white-faced, tremulous man, wiped her eyes, and replied in a shaky voice: “Her name, poor child, was Minna Adler. She was a German. She came from Bremen about two years ago. She had no friends in England—no relatives, I mean. She was a waitress at a restaurant in Fenchurch Street, and a good, quiet, hard-working girl.”

“When did you discover what had happened?”

“About eleven o’clock. I thought she had gone to work as usual, but my husband noticed from the back yard that her blind was still down. So I went up and knocked, and when I got no answer, I opened the door and went in, and then I saw —” Here the poor soul, overcome by the dreadful recollection, burst into hysterical sobs.

“Her door was unlocked, then; did she usually lock it?”

“I think so,” sobbed Mrs. Goldstein. “The key was always inside.”

“And the street door; was that secure when you came down this morning?”
“It was shut. We don’t bolt it because some of the lodgers come home rather late.”

“And now tell us, had she any enemies? Was there anyone who had a grudge against her?”

“No, no, poor child! Why should anyone have a grudge against her? No, she had no quarrel—no real quarrel—with anyone; not even with Miriam.”

“Miriam!” inquired the inspector. “Who is she?”

“That was nothing,” interposed the man hastily. “That was not a quarrel.”

“Just a little unpleasantness, I suppose, Mr. Goldstein?” suggested the inspector.

“Just a little foolishness about a young man,” said Mr. Goldstein. “That was all. Miriam was a little jealous. But it was nothing.”

“No, no. Of course. We all know that young women are apt to—”

A soft footstep had been for some time audible, slowly descending the stair above, and at this moment a turn of the staircase brought the newcomer into view. And at that vision the inspector stopped short as if petrified, and a tense, startled silence fell upon us all. Down the remaining stairs there advanced towards us a young woman, powerful though short, wild-eyed, dishevelled, horror-stricken, and of a ghastly pallor: and her hair was a fiery red.

Stock still and speechless we all stood as this apparition came slowly towards us; but suddenly the detective slipped back into the room, closing the door after him, to reappear a few moments later holding a small paper packet, which, after a quick glance at the inspector, he placed in his breast pocket.

“This is my daughter Miriam that we spoke about, gentlemen,” said Mr. Goldstein. “Miriam, those are the doctors and the police.”

The girl looked at us from one to the other. “You have seen her, then,” she said in a strange, muffled voice, and added: “She isn’t dead, is she? Not really dead?” The question was asked in a tone at once coaxing and despairing, such as a distracted mother might use over the corpse of her child. It filled me with vague discomfort, and, unconsciously, I looked round towards Thorndyke.

To my surprise he had vanished.

Noiselessly backing towards the head of the stairs, where I could command a view of the hall, or passage. I looked down, and saw him in the act of reaching up to a shelf behind the street door. He caught my eye, and beckoned, whereupon I crept away unnoticed by the party on the landing. When I reached the hall, he was wrapping up three small objects, each in a separate cigarette-paper; and I noticed that he handled them with more than ordinary tenderness.

“We didn’t want to see that poor devil of a girl arrested,” said he, as he deposited the three little packets gingerly in his pocket-box. “Let us be off.” He opened the door noiselessly, and stood for a moment, turning the latch backwards and forwards, and closely examining its bolt.

I glanced up at the shelf behind the door. On it were two flat china candlesticks, in one of which I had happened to notice, as we came in, a short end of candle lying in the tray, and I now looked to see if that was what Thorndyke had annexed; but it was still there.

I followed my colleague out into the street, and for some time we walked on without speaking. “You guessed what the sergeant had in that paper, of course,” said Thorndyke at length.

“Yes. It was the hair from the dead woman’s hand; and I thought that he had much better have left it there.”

“Undoubtedly. But that is the way in which well-meaning policemen destroy valuable evidence. Not that it matters much in this particular instance; but it might have been a fatal mistake.”

“Do you intend to take any active part in this case?” I asked.

“That depends on circumstances. I have collected some evidence, but what it is worth I don’t yet know. Neither do I know whether the police have observed the same set of facts; but I need not say that I shall do anything that seems necessary to assist the authorities. That is a matter of common citizenship.”

The inroads made upon our time by the morning’s adventures made it necessary that we should go each about his respective business without delay; so, after a perfunctory lunch at a tea-shop, we separated, and I did not see my colleague again until the day’s work was finished, and I turned into our chambers just before dinner-time.

Here I found Thorndyke seated at the table, and evidently full of business. A microscope stood close by, with a condenser throwing a spot of light on to a pinch of powder that had been sprinkled on to the slide; his collecting-box lay open before him, and he was engaged, rather mysteriously, in squeezing a thick white cement from a tube on to three little pieces of moulding-wax.

“Useful stuff, this Fortafix,” he remarked; “it makes excellent casts, and saves the trouble and mess of mixing plaster, which is a consideration for small work like this. By the way, if you want to know what was on that poor girl’s pillow, just take a peep through the microscope. It is rather a pretty specimen.”

I stepped across, and applied my eye to the instrument. The specimen was, indeed, pretty in more than a technical sense.
Mingled with crystalline grains of quartz, glassy spicules, and water-worn fragments of coral, were a number of lovely little shells, some of the texture of fine porcelain, others like blown Venetian glass.

"These are Foraminifera!" I exclaimed.
"Yes."
"Then it is not silver sand, after all?"
"Certainly not."
"But what is it, then?"
Thorndyke smiled. "It is a message to us from the deep sea, Jervis; from the floor of the Eastern Mediterranean."
"And can you read the message?"
"I think I can," he replied, "but I shall know soon, I hope."

I looked down the microscope again, and wondered what message these tiny shells had conveyed to my friend. Deep-sea sand on a dead woman's pillow! What could be more incongruous? What possible connection could there be between this sordid crime in the east of London and the deep bed of the "tideless sea"?

Meanwhile Thorndyke squeezed out more cement on to the three little pieces of moulding-wax (which I suspected to be the objects that I had seen him wrapping up with such care in the hall of the Goldsteins' house); then, laying one of them down on a glass slide, with its cemented side uppermost, he stood the other two upright on either side of it. Finally he squeezed out a fresh load of the thick cement, apparently to bind the three objects together, and carried the slide very carefully to a cupboard, where he deposited it, together with the envelope containing the sand and the slide from the stage of the microscope.

He was just locking the cupboard when a sharp rat-tat on our knocker sent him hurriedly to the door. A messenger-boy, standing on the threshold, held out a dirty envelope.

"Mr. Goldstein kept me a awful long time, sir," said he; "I haven't been a-loitering."

Thorndyke took the envelope over to the gas-light, and, opening it, drew forth a sheet of paper, which he scanned quickly and almost eagerly; and, though his face remained as inscrutable as a mask of stone, I felt a conviction that the paper had told him something that he wished to know.

The boy having been sent on his way rejoicing, Thorndyke turned to the bookshelves, along which he ran his eye thoughtfully until it alighted on a shabbily-bound volume near one end. This he reached down, and as he laid it open on
the table, I glanced at it, and was surprised to observe that it was a bi-lingual work, the opposite pages being apparently in Russian and Hebrew.

"The Old Testament in Russian and Yiddish," he remarked, noting my surprise. "I am going to get Polton to photograph a couple of specimen pages—is that the postman or a visitor?"

It turned out to be the postman, and as Thorndyke extracted from the letter-box a blue official envelope, he glanced significantly at me.

"This answers your question, I think, Jervis," said he. "Yes; coroner's subpoena and a very civil letter: 'Sorry to trouble you, but I had no choice under the circumstances'—of course he hadn't—'Dr. Davidson has arranged to make the autopsy to-morrow at 4 p.m., and I should be glad if you could be present. The mortuary is in Barker Street, next to the school.' Well, we must go, I suppose, though Davidson will probably resent it." He took up the Testament, and went off with it to the laboratory.

We dined at our chambers on the following day, and, after the meal, drew up our chairs to the fire and lit our pipes. Thorndyke was evidently preoccupied, for he laid his open notebook on his knee, and, gazing meditatively into the fire, made occasional entries with his pencil as though he were arranging the points of an argument. Assuming that the Aldgate murder was the subject of his cogitations, I ventured to ask:

"Have you any material evidence to offer the coroner?"

He closed his notebook and put it away. "The evidence that I have," he said, "is material and important; but it is disjointed and rather inconclusive. If I can join it up into a coherent whole, as I hope to do before I reach the court, it will be very important indeed—but here is my invaluable familiar, with the instruments of research." He turned with a smile towards Polton, who had just entered the room, and master and man exchanged a friendly glance of mutual appreciation. The relations of Thorndyke and his assistant were a constant delight to me: on the one side, service, loyal and whole-hearted; on the other, frank and full recognition.

"I should think those will do, sir," said Polton, handing his principal a small cardboard box such as playing-cards are carried in. Thorndyke pulled off the lid, and I then saw that the box was fitted internally with grooves for plates, and contained two mounted photographs. The latter were very singular productions indeed; they were copies each of a page of the Testament, one Russian and the other Yiddish; but the lettering appeared white on a black ground, of which it occupied only quite a small space in the middle, leaving a broad black margin. Each photograph was mounted on a stiff card, and each card had a duplicate photograph pasted on the back.

Thorndyke exhibited them to me with a provoking smile, holding them daintily by their edges, before he slid them back into the grooves of their box.

"We are making a little digression into philology, you see," he remarked, as he pocketed the box. "But we must be off now, or we shall keep Davidson waiting. Thank you, Polton."

The District Railway carried us swiftly eastward, and we emerged from Aldgate Station a full half-hour before we were due. Nevertheless, Thorndyke stepped out briskly, but instead of making directly for the mortuary, he strayed off unaccountably into Mansell Street, scanning the numbers of the houses as he went. A row of old houses, picturesque but grimy, on our right seemed specially to attract him, and he slowed down as we approached them.

"There is a quaint survival, Jervis," he remarked, pointing to a crudely painted, wooden effigy of an Indian standing on a bracket at the door of a small old-fashioned tobacconist's shop. We halted to look at the little image, and at that moment the side door opened, and a woman came out to the doorstop, where she stood gazing up and down the street.

Thorndyke immediately crossed the pavement, and addressed her, apparently with some question, for I heard her answer presently: "A quarter-past six is his time, sir, and he is generally punctual to the minute."

"Thank you," said Thorndyke; "I'll bear that in mind;" and, lifting his hat, he walked on briskly, turning presently up a side-street which brought us out into Aldgate. It was now but five minutes to four, so we strode off quickly to keep our tryst at the mortuary; but although we arrived at the gate as the hour was striking, when we entered the building we found Dr. Davidson hanging up his apron and preparing to depart.

"Sorry I couldn't wait for you," he said, with no great show of sincerity, "but a post-mortem is a mere farce in a case like this; you have seen all that there was to see. However, there is the body; Hart hasn't closed it up yet."

With this and a curt "good-afternoon" he departed.

"I must apologize for Dr. Davidson, sir," said Hart, looking up with a vexed face from the desk at which he was writing out his notes.

"You needn't," said Thorndyke; "you didn't supply him with manners; and don't let me disturb you. I only want to verify one or two points."

Accepting the hint, Hart and I remained at the desk, while Thorndyke, removing his hat, advanced to the long slate table, and bent over its burden of pitiful tragedy. For some time he remained motionless, running his eye gravely over the corpse, in search, no doubt, of bruises and indications of a struggle. Then he stooped and narrowly examined the wound, especially at its commencement and end. Suddenly he drew nearer, peering intently as if something had attracted his attention, and..."
having taken out his lens, fetched a small sponge, with which he dried an exposed process of the spine. Holding his lens before the dried spot, he again scrutinized it closely, and then, with a scalpel and forceps, detached some object, which he carefully washed, and then once more examined through his lens as it lay in the palm of his hand. Finally, as I expected, he brought forth his “collecting-box,” took from it a seed-envelope, into which he dropped the object—evidently something quite small—closed up the envelope, wrote on the outside of it, and replaced it in the box.

“I think I have seen all that I wanted to see,” he said, as he pocketed the box and took up his hat. “We shall meet tomorrow morning at the inquest.” He shook hands with Hart, and we went out into the relatively pure air.

On one pretext or another, Thorndyke lingered about the neighbourhood of Aldgate until a church bell struck six, when he bent his steps towards Harrow Alley. Through the narrow, winding passage he walked, slowly and with a thoughtful mien, along Little Somerset Street and out into Mansell Street, until just on the stroke of a quarter-past we found ourselves opposite the little tobacconist’s shop.

Thorndyke glanced at his watch and halted, looking keenly up the street. A moment later he hastily took from his pocket the cardboard box, from which he extracted the two mounted photographs which had puzzled me so much. They now seemed to puzzle Thorndyke equally, to judge by his expression, for he held them close to his eyes, scrutinizing them with an anxious frown, and backing by degrees into the doorway at the side of the tobacconist’s. At this moment I became aware of a man who, as he approached, seemed to eye my friend with some curiosity and more disfavour; a very short, burly young man, apparently a foreign Jew, whose face, naturally sinister and unprepossessing, was further disfigured by the marks of smallpox.

“Excuse me,” he said brusquely, pushing past Thorndyke; “I live here.”

“I am sorry,” responded Thorndyke. He moved aside, and then suddenly asked: “By the way, I suppose you do not by any chance understand Yiddish?”

“Why do you ask?” the newcomer demanded gruffly.

“Because I have just had these two photographs of lettering given to me. One is in Greek, I think, and one in Yiddish, but I have forgotten which is which.” He held out the two cards to the stranger, who took them from him, and looked at them with scowling curiosity.

“This one is Yiddish,” said he, raising his right hand, “and this other is Russian, not Greek.” He held out the two cards to Thorndyke, who took them from him, holding them carefully by the edges as before.

“I am greatly obliged to you for your kind assistance,” said Thorndyke; but before he had time to finish his thanks, the man had entered, by means of his latchkey, and slammed the door.

Thorndyke carefully slid the photographs back into their grooves, replaced the box in his pocket, and made an entry in his notebook.

“That,” said he, “finishes my labours, with the exception of a small experiment which I can perform at home. By the way, I picked up a morsel of evidence that Davidson had overlooked. He will be annoyed, and I am not very fond of scoring off a colleague; but he is too uncivil for me to communicate with.”

* * * * *

The coroner’s subpoena had named ten o’clock as the hour at which Thorndyke was to attend to give evidence, but a consultation with a well-known solicitor so far interfered with his plans that we were a quarter of an hour late in starting from the Temple. My friend was evidently in excellent spirits, though silent and preoccupied, from which I inferred that he was satisfied with the results of his labours; but, as I sat by his side in the hansom, I forbore to question him, not from mere unselfishness, but rather from the desire to hear his evidence for the first time in conjunction with that of the other witnesses.

The room in which the inquest was held formed part of a school adjoining the mortuary. Its vacant bareness was on this occasion enlivened by a long, baize-covered table, at the head of which sat the coroner, while one side was occupied by the jury; and I was glad to observe that the latter consisted, for the most part, of genuine working men, instead of the stolid-faced, truculent “professional jurymen” who so often grace these tribunals.

A row of chairs accommodated the witnesses, a corner of the table was allotted to the accused woman’s solicitor, a smart dapper gentleman in gold pince-nez, a portion of one side to the reporters, and several ranks of benches were occupied by a miscellaneous assembly representing the public.

There were one or two persons present whom I was somewhat surprised to see. There was, for instance, our pokemarked acquaintance of Mansell Street, who greeted us with a stare of hostile surprise; and there was Superintendent Miller of Scotland Yard, in whose manner I seemed to detect some kind of private understanding with Thorndyke. But I had little time to look about me, for when we arrived, the proceedings had already commenced. Mrs. Goldstein, the first witness, was finishing her recital of the circumstances under which the crime was discovered, and, as she retired, weeping hysterically, she was followed by looks of commiseration from the sympathetic jurymen.

The next witness was a young woman named Kate Silver. As she stepped forward to be sworn she flung a glance of hatred and defiance at Miriam Goldstein, who, white-faced and wild of aspect, with her red hair streaming in dishevelled masses on to her shoulders, stood apart in custody of two policemen, staring about her as if in a dream.
“You were intimately acquainted with the deceased, I believe?” said the coroner.

“I was. We worked at the same place for a long time—the Empire Restaurant in Fenchurch Street—and we lived in the same house. She was my most intimate friend.”

“Had she, as far as you know, any friends or relations in England?”

“No. She came to England from Bremen about three years ago. It was then that I made her acquaintance. All her relations were in Germany, but she had many friends here, because she was a very lively, amiable girl.”

“Had she, as far as you know, any enemies—any persons, I mean, who bore any grudge against her and were likely to do her an injury?”

“Yes. Miriam Goldstein was her enemy. She hated her.”

“You say Miriam Goldstein hated the deceased. How do you know that?”

“She made no secret of it. They had had a violent quarrel about a young man named Moses Cohen. He was formerly Miriam’s sweetheart, and I think they were very fond of one another until Minna Adler came to lodge at the Goldsteins’ house about three months ago. Then Moses took a fancy to Minna, and she encouraged him, although she had a sweetheart of her own, a young man named Paul Petrofsky, who also lodged in the Goldsteins’ house. At last Moses broke off with Miriam, and engaged himself to Minna. Then Miriam was furious, and complained to Minna about what she called her perfidious conduct; but Minna only laughed, and told her she could have Petrofsky instead.”

“And what did Minna say to that?” asked the coroner.

“She was still more angry, because Moses Cohen is a smart, good-looking young man, while Petrofsky is not much to look at. Besides, Miriam did not like Petrofsky; he had been rude to her, and she had made her father send him away from the house. So they were not friends, and it was just after that that the trouble came.”

“The trouble?”

“I mean about Moses Cohen. Miriam is a very passionate girl, and she was furiously jealous of Minna, so when Petrofsky annoyed her by taunting her about Moses Cohen and Minna, she lost her temper, and said dreadful things about both of them.”

“As, for instance—?”

“She said that she would kill them both, and that she would like to cut Minna’s throat.”

“When was this?”

“It was the day before the murder.”

“Who heard her say these things besides you?”

“Another lodger named Edith Bryant and Petrofsky. We were all standing in the hall at the time.”

“But I thought you said Petrofsky had been turned away from the house.”

“So he had, a week before; but he had left a box in his room, and on this day he had come to fetch it. That was what started the trouble. Miriam had taken his room for her bedroom, and turned her old one into a workroom. She said he should not go to her room to fetch his box.”

“And did he?”

“I think so. Miriam and Edith and I went out, leaving him in the hall. When we came back the box was gone, and, as Mrs. Goldstein was in the kitchen and there was nobody else in the house, he must have taken it.”

“You spoke of Miriam’s workroom. What work did she do?”

“She cut stencils for a firm of decorators.”

Here the coroner took a peculiarly shaped knife from the table before him, and handed it to the witness.

“Have you ever seen that knife before?” he asked.

“Yes. It belongs to Miriam Goldstein. It is a stencil-knife that she used in her work.”

This concluded the evidence of Kate Silver, and when the name of the next witness, Paul Petrofsky, was called, our Mansell Street friend came forward to be sworn. His evidence was quite brief, and merely corroborative of that of Kate Silver, as was that of the next witness, Edith Bryant. When these had been disposed of, the coroner announced:

“Before taking the medical evidence, gentlemen, I propose to hear that of the police-officers, and first we will call Detective-sergeant Alfred Bates.”

The sergeant stepped forward briskly, and proceeded to give his evidence with official readiness and precision.

“I was called by Constable Simmonds at eleven-forty-nine, and reached the house at two minutes to twelve in company with Inspector Harris and Divisional Surgeon Davidson. When I arrived Dr. Hart, Dr. Thorndyke, and Dr. Jervis were already in the room. I found the deceased woman, Minna Adler, lying in bed with her throat cut. She was dead and cold.
There were no signs of a struggle, and the bed did not appear to have been disturbed. There was a table by the bedside on which was a book and an empty candlestick. The candle had apparently burnt out, for there was only a piece of charred wick at the bottom of the socket. A box had been placed on the floor at the head of the bed and a hassock stood on it. Apparently the murderer had stood on the hassock and leaned over the head of the dead to commit the murder. This was rendered necessary by the position of the table, which could not have been moved without making some noise and perhaps disturbing the deceased. I infer from the presence of the box and hassock that the murderer is a short person.

"Was there anything else that seemed to fix the identity of the murderer?"

"Yes. A tress of a woman’s red hair was grasped in the left hand of the deceased."

As the detective uttered this statement, a simultaneous shriek of horror burst from the accused woman and her mother. Mrs. Goldstein sank half-fainting on to a bench, while Miriam, pale as death, stood as one petrified, fixing the detective with a stare of terror, as he drew from his pocket two small paper packets, which he opened and handed to the coroner.

"The hair in the packet marked A,” said he, “is that which was found in the hand of the deceased; that in the packet marked B is the hair of Miriam Goldstein."

Here the accused woman’s solicitor rose. “Where did you obtain the hair in the packet marked B?” he demanded.

"I took it from a bag of comings that hung on the wall of Miriam Goldstein’s bedroom,” answered the detective.

"I object to this,” said the solicitor. “There is no evidence that the hair from that bag was the hair of Miriam Goldstein at all.”

Thorndyke chuckled softly. “The lawyer is as dense as the policeman,” he remarked to me in an undertone. “Neither of them seems to see the significance of that bag in the least.”

"Did you know about the bag, then?” I asked in surprise.

"No. I thought it was the hair-brush."

I gazed at my colleague in amazement, and was about to ask for some elucidation of this cryptic reply, when he held up his finger and turned again to listen.

"Very well, Mr. Horwitz,” the coroner was saying, “I will make a note of your objection, but I shall allow the sergeant to continue his evidence."

The solicitor sat down, and the detective resumed his statement.

"I have examined and compared the two samples of hair, and it is my opinion that they are from the head of the same person. The only other observation that I made in the room was that there was a small quantity of silver sand sprinkled on the pillow around the deceased woman’s head."

"Silver sand!” exclaimed the coroner. “Surely that is a very singular material to find on a woman’s pillow?"

"I think it is easily explained,” replied the sergeant. “The wash-hand basin was full of bloodstained water, showing that the murderer had washed his—or her—hands, and probably the knife, too, after the crime. On the washstand was a ball of sand-soap, and I imagine that the murderer used this to cleanse his—or her—hands, and, while drying them, must have stood over the head of the bed and let the sand sprinkle down on to the pillow."

"A simple but highly ingenious explanation,” commented the coroner approvingly, and the jurymen exchanged admiring nods and nudges.

"I searched the rooms occupied by the accused woman, Miriam Goldstein, and found there a knife of the kind used by stencil cutters, but larger than usual. There were stains of blood on it which the accused explained by saying that she cut her finger some days ago. She admitted that the knife was hers."

This concluded the sergeant’s evidence, and he was about to sit down when the solicitor rose.

"I should like to ask this witness one or two questions,” said he, and the coroner having nodded assent, he proceeded: “Has the finger of the accused been examined since her arrest?"

"I believe not,” replied the sergeant. “Not to my knowledge, at any rate."

The solicitor noted the reply, and then asked: "With reference to the silver sand, did you find any at the bottom of the wash-hand basin?"

The sergeant’s face reddened. “I did not examine the wash-hand basin,” he answered.

"Did anybody examine it?"

"I think not."

"Thank you.” Mr. Horwitz sat down, and the triumphant squeak of his quill pen was heard above the muttered disapproval of the jury.

"We shall now take the evidence of the doctors, gentlemen,” said the coroner, “and we will begin with that of the divisional surgeon. You saw the deceased, I believe, Doctor,” he continued, when Dr. Davidson had been sworn, “soon after the discovery of the murder, and you have since then made an examination of the body?”
“Yes. I found the body of the deceased lying in her bed, which had apparently not been disturbed. She had been dead about ten hours, and rigidity was complete in the limbs but not in the trunk. The cause of death was a deep wound extending right across the throat and dividing all the structures down to the spine. It had been inflicted with a single sweep of a knife while deceased was lying down, and was evidently homicidal. It was not possible for the deceased to have inflicted the wound herself. It was made with a single-edged knife, drawn from left to right; the assailant stood on a hassock placed on a box at the head of the bed and leaned over to strike the blow. The murderer is probably quite a short person, very muscular, and right-handed. There was no sign of a struggle, and, judging by the nature of the injuries, I should say that death was almost instantaneous. In the left hand of the deceased was a small tress of a woman’s red hair. I have compared that hair with that of the accused, and am of opinion that it is her hair.”

“You were shown a knife belonging to the accused?”

“Yes; a stencil-knife. There were stains of dried blood on it which I have examined and find to be mammalian blood. It is probably human blood, but I cannot say with certainty that it is.”

“Could the wound have been inflicted with this knife?”

“Yes, though it is a small knife to produce so deep a wound. Still, it is quite possible.”

The coroner glanced at Mr. Horwitz. “Do you wish to ask this witness any questions?” he inquired.

“If you please, sir,” was the reply. The solicitor rose, and, having glanced through his notes, commenced: “You have described certain blood-stains on this knife. But we have heard that there was blood-stained water in the wash-hand basin, and it is suggested, most reasonably, that the murderer washed his hands and the knife. But if the knife was washed, how do you account for the bloodstains on it?”

“Apparently the knife was not washed, only the hands.”

“But not that highly improbable?”

“No, I think not.”

“You say that there was no struggle, and that death was practically instantaneous, but yet the deceased had torn out a lock of the murderess’s hair. Are not those two statements inconsistent with one another?”

“No. The hair was probably grasped convulsively at the moment of death. At any rate, the hair was undoubtedly in the dead woman’s hand.”

“Is it possible to identify positively the hair of any individual?”

“No. Not with certainty. But this is very peculiar hair.”

The solicitor sat down, and, Dr. Hart having been called, and having briefly confirmed the evidence of his principal, the coroner announced: “The next witness, gentleman, is Dr. Thorndyke, who was present almost accidentally, but was actually the first on the scene of the murder. He has since made an examination of the body, and will, no doubt, be able to throw some further light on this horrible crime.”

Thorndyke stood up, and, having been sworn, laid on the table a small box with a leather handle. Then, in answer to the coroner’s questions, he described himself as the lecturer on Medical Jurisprudence at St. Margaret’s Hospital, and briefly explained his connection with the case. At this point the foreman of the jury interrupted to ask that his opinion might be taken on the hair and the knife, as these were matters of contention, and the objects in question were accordingly handed to him.

“Is the hair in the packet marked A in your opinion from the same person as that in the packet marked B?” the coroner asked.

“I have no doubt that they are from the same person,” was the reply.

“Will you examine this knife and tell us if the wound on the deceased might have been inflicted with it?”

Thorndyke examined the blade attentively, and then handed the knife back to the coroner.

“The wound might have been inflicted with this knife,” said he, “but I am quite sure it was not.”

“Can you give us your reasons for that very definite opinion?”

“I think,” said Thorndyke, “that it will save time if I give you the facts in a connected order.” The coroner bowed assent, and he proceeded: “I will not waste your time by reiterating facts already stated. Sergeant Bates has fully described the state of the room, and I have nothing to add on that subject. Dr. Davidson’s description of the body covers all the facts: the woman had been dead about ten hours, the wound was unquestionably homicidal, and was inflicted in the manner that he has described. Death was apparently instantaneous, and I should say that the deceased never awakened from her sleep.”

“But,” objected the coroner, “the deceased held a lock of hair in her hand.”

“That hair,” replied Thorndyke, “was not the hair of the murderer. It was placed in the hand of the corpse for an obvious purpose; and the fact that the murderer had brought it with him shows that the crime was premeditated, and that it was committed by someone who had had access to the house and was acquainted with its inmates.”
As Thorndyke made this statement, coroner, jurymen, and spectators alike gazed at him in open-mouthed amazement. There was an interval of intense silence, broken by a wild, hysterical laugh from Mrs. Goldstein, and then the coroner asked:

“How did you know that the hair in the hand of the corpse was not that of the murderer?”

“The inference was very obvious. At the first glance the peculiar and conspicuous colour of the hair struck me as suspicious. But there were three facts, each of which was in itself sufficient to prove that the hair was probably not that of the murderer.

“In the first place there was the condition of the hand. When a person, at the moment of death, grasps any object firmly, there is set up a condition known as cadaveric spasm. The muscular contraction passes immediately into rigor mortis, or death-stiffening, and the object remains grasped by the dead hand until the rigidity passes off. In this case the hand was perfectly rigid, but it did not grasp the hair at all. The little tress lay in the palm quite loosely and the hand was only partially closed. Obviously the hair had been placed in it after death. The other two facts had reference to the condition of the hair itself. Now, when a lock of hair is torn from the head, it is evident that all the roots will be found at the same end of the lock. But in the present instance this was not the case; the lock of hair which lay in the dead woman’s hand had roots at both ends, and so could not have been torn from the head of the murderer. But the third fact that I observed was still more conclusive. The hairs of which that little tress was composed had not been pulled out at all. They had fallen out spontaneously. They were, in fact, shed hairs—probably combings. Let me explain the difference. When a hair is shed naturally, it drops out of the little tube in the skin called the root sheath, having been pushed out by the young hair growing up underneath; the root end of such a shed hair shows nothing but a small bulbous enlargement—the root bulb. But when a hair is forcibly pulled out, its root drags out the root sheath with it, and this can be plainly seen as a glistening mass on the end of the hair. If Miriam Goldstein will pull out a hair and pass it to me, I will show you the great difference between hair which is pulled out and hair which is shed.”
The unfortunate Miriam needed no pressing. In a twinkling she had tweaked out a dozen hairs, which a constable handed across to Thorndyke, by whom they were at once fixed in a paper-clip. A second clip being produced from the box, half a dozen hairs taken from the tress which had been found in the dead woman’s hand were fixed in it. Then Thorndyke handed the two clips, together with a lens, to the coroner.

"Remarkable!" exclaimed the latter, "and most conclusive." He passed the objects on to the foreman, and there was an interval of silence while the jury examined them with breathless interest and much facial contortion.

"The next question," resumed Thorndyke, "was, Whence did the murderer obtain these hairs? I assumed that they had been taken from Miriam Goldstein’s hair-brush; but the sergeant’s evidence makes it pretty clear that they were obtained from the very bag of combings from which he took a sample for comparison."

"I think, Doctor," remarked the coroner, "you have disposed of the hair clue pretty completely. May I ask if you found anything that might throw any light on the identity of the murderer?"

"Yes," replied Thorndyke, "I observed certain things which determine the identity of the murderer quite conclusively." He turned a significant glance on Superintendent Miller, who immediately rose, stepped quietly to the door, and then returned, putting something into his pocket. "When I entered the hall," Thorndyke continued, "I noted the following facts:
Behind the door was a shelf on which were two china candlesticks. Each was fitted with a candle, and in one was a short candle-end, about an inch long, lying in the tray. On the floor, close to the mat, was a spot of candle-wax and some faint marks of muddy feet. The oil-cloth on the stairs also bore faint footmarks, made by wet goloshes. They were ascending the stairs, and grew fainter towards the top. There were two more spots of candle-wax on the stairs, and one on the handrail; a burnt end of a wax match halfway up the stairs, and another on the landing. There were no descending footmarks, but one of the spots of wax close to the balusters had been trodden on while warm and soft, and bore the mark of the front of the heel of a golosh descending the stairs. The lock of the street door had been recently oiled, as had also that of the bedroom door, and the latter had been unlocked from outside with a bent wire, which had made a mark on the key. Inside the room I made two further observations. One was that the dead woman’s pillow was lightly sprinkled with sand, somewhat like silver sand, but greyer and less gritty. I shall return to this presently.

“The other was that the candlestick on the bedside table was empty. It was a peculiar candlestick, having a skeleton socket formed of eight flat strips of metal. The charred wick of a burnt-out candle was at the bottom of the socket, but a little fragment of wax on the top edge showed that another candle had been stuck in it and had been taken out, for otherwise that fragment would have been melted. I at once thought of the candle-end in the hall, and when I went down again I took that end from the tray and examined it. On it I found eight distinct marks corresponding to the eight bars of the candlestick in the bedroom. It had been carried in the right hand of some person, for the warm, soft wax had taken beautifully clear impressions of a right thumb and forefinger. I took three moulds of the candle-end in moulding wax, and from these moulds have made this cement cast, which shows both the fingerprints and the marks of the candlestick.” He took from his box a small white object, which he handed to the coroner.

“And what do you gather from these facts?” asked the coroner.

“I gather that at about a quarter to two on the morning of the crime, a man (who had, on the previous day visited the house to obtain the tress of hair and oil the locks) entered the house by means of a latchkey. We can fix the time by the fact that it rained on that morning from half-past one to a quarter to two, this being the only rain that has fallen for a fortnight, and the murder was committed at about two o’clock. The man lit a wax match in the hall and another halfway up the stairs. He found the bedroom door locked, and turned the key from outside with a bent wire. He entered, lit the candle, placed the box and hassock, murdered his victim, washed his hands and knife, took the candle-end from the socket and went downstairs, where he blew out the candle and dropped it into the tray.

“The next clue is furnished by the sand on the pillow. I took a little of it, and examined it under the microscope, when it turned out to be deep-sea sand from the Eastern Mediterranean. It was full of the minute shells called ‘Foraminifera,’ and as one of these happened to belong to a species which is found only in the Levant, I was able to fix the locality.”

“But this is very remarkable,” said the coroner. “How on earth could deep-sea sand have got on to this woman’s pillow?”

“The explanation,” replied Thorndyke, “is really quite simple. Sand of this kind is contained in considerable quantities in Turkey sponges. The warehouses in which the sponges are unpacked are often strewn with it ankle deep; the men who unpack the cases become dusted over with it, their clothes saturated and their pockets filled with it. If such a person, with his clothes and pockets full of sand, had committed this murder, it is pretty certain that in leaning over the head of the bed in a partly inverted position he would have let fall a certain quantity of the sand from his pockets and the interstices of his clothing. Now, as soon as I had examined this sand and ascertained its nature, I sent a message to Mr. Goldstein asking him for a list of the persons who were acquainted with the deceased, with their addresses and occupations. He sent me the list by return, and among the persons mentioned was a man who was engaged as a packer in a wholesale sponge warehouse in the Minories. I further ascertained that the new season’s crop of Turkey sponges had arrived a few days before the murder.

“The question that now arose was, whether this sponge-packer was the person whose fingerprints I had found on the candle-end. To settle this point, I prepared two mounted photographs, and having contrived to meet the man at his door on his return from work, I induced him to look at them and compare them. He took them from me, holding each one between a forefinger and thumb. When he returned them to me, I took them home and carefully dusted each on both sides with a certain surgical dusting-powder. The powder adhered to the places where his fingers and thumbs had pressed against the photographs, showing the fingerprints very distinctly. Those of the right hand were identical with the prints on the candle, as you will see if you compare them with the cast.” He produced from the box the photograph of the Yiddish lettering, on the black margin of which there now stood out with startling distinctness a yellowish-white print of a thumb.

Thorndyke had just handed the card to the coroner when a very singular disturbance arose. While my friend had been giving the latter part of his evidence, I had observed the man Petrofsky rise from his seat and walk stealthily across to the door. He turned the handle softly and pulled, at first gently, and then with more force. But the door was locked. As he realized this, Petrofsky seized the handle with both hands and tore at it furiously, shaking it to and fro with the violence of a madman, and his shaking limbs, his starting eyes, glaring insanely at the astonished spectators, his ugly face, dead white, running with sweat and hideous with terror, made a picture that was truly shocking.

Suddenly he let go the handle, and with a horrible cry thrust his hand under the skirt of his coat and rushed at Thorndyke. But the superintendent was ready for this. There was a shout and a scuffle, and then Petrofsky was born down, kicking and biting like a maniac, while Miller hung on to his right hand and the formidable knife that it grasped.
“I will ask you to hand that knife to the coroner,” said Thorndyke, when Petrofsky had been secured and handcuffed, and the superintendent had readjusted his collar. “Will you kindly examine it, sir,” he continued, “and tell me if there is a notch in the edge, near to the point—a triangular notch about an eighth of an inch long?”

The coroner looked at the knife, and then said in a tone of surprise: “Yes, there is. You have seen this knife before, then?”

“No, I have not,” replied Thorndyke. “But perhaps I had better continue my statement. There is no need for me to tell you that the fingerprints on the card and on the candle are those of Paul Petrofsky; I will proceed to the evidence furnished by the body.

“In accordance with your order, I went to the mortuary and examined the corpse of the deceased. The wound has been fully and accurately described by Dr. Davidson, but I observed one fact which I presume he had overlooked. Embedded in the bone of the spine—in the left transverse process of the fourth vertebra—I discovered a small particle of steel, which I carefully extracted.”

He drew his collecting-box from his pocket, and taking from it a seed-envelope, handed the latter to the coroner. “That fragment of steel is in this envelope,” he said, “and it is possible that it may correspond to the notch in the knife-blade.”

Amidst an intense silence the coroner opened the little envelope, and let the fragment of steel drop on to a sheet of
paper. Laying the knife on the paper, he gently pushed the fragment towards the notch. Then he looked up at Thorndyke.

"It fits exactly," said he.

There was a heavy thud at the other end of the room and we all looked round.

Petrofsky had fallen on to the floor insensible.

****

"An instructive case, Jervis," remarked Thorndyke, as we walked homewards—"a case that reiterates the lesson that the authorities still refuse to learn."

"What is that?" I asked.

"It is this. When it is discovered that a murder has been committed, the scene of that murder should instantly become as the Palace of the Sleeping Beauty. Not a grain of dust should be moved, not a soul should be allowed to approach it, until the scientific observer has seen everything in situ and absolutely undisturbed. No trampling of excited constables, no rummaging by detectives, no scrambling to and fro of bloodhounds. Consider what would have happened in this case if we had arrived a few hours later. The corpse would have been in the mortuary, the hair in the sergeant's pocket, the bed rummaged and the sand scattered abroad, the candle probably removed, and the stairs covered with fresh tracks.

"There would not have been the vestige of a clue."

"And," I added, "the deep sea would have uttered its message in vain."

THE END.
I. — THE VANISHING MAN

THE SCHOOL of St Margaret’s Hospital was fortunate in its lecturer on Medical Jurisprudence, or Forensic Medicine, as it is sometimes described. At some schools the lecturer on this subject is appointed apparently for the reason that he lacks the qualifications to lecture on any other. But with us it was very different: John Thorndyke was not only an enthusiast, a man of profound learning and great reputation, but he was an exceptional teacher, lively and fascinating in style and of endless resources. Every remarkable case that had ever been reported he appeared to have at his fingers’ ends; every fact—chemical, physical, biological, or even historical—that could in any way be twisted into a medico-legal significance, was pressed into his service; and his own varied and curious experiences seemed as inexhaustible as the widow’s cruse. One of his favourite devices for giving life and interest to a rather dry subject was that of analysing and commenting upon contemporary cases as reported in the papers (always, of course, with a due regard to the legal and social proprieties); and it was in this way that I first became introduced to the astonishing series of events that was destined to exercise so great an influence on my own life.

The lecture which had just been concluded had dealt with the rather unsatisfactory subject of survivorship. Most of the students had left the theatre, and the remainder had gathered round the lecturer’s table to listen to the informal comments
that Dr. Thorndyke was wont to deliver on these occasions in an easy, conversational manner, leaning against the edge of the table and apparently addressing his remarks to a stick of blackboard chalk that he held in his fingers.

'The problem of survivorship,' he was saying, in reply to a question put by one of the students, 'ordinarily occurs in cases where the bodies of the parties are producible, or where, at any rate, the occurrence of death and its approximate time are actually known. But an analogous difficulty may arise in a case where the body of one of the parties is not forthcoming, and the fact of death may have to be assumed on collateral evidence.

'Here, of course, the vital question to be settled is, what is the latest instant at which it is certain that this person was alive? And the determination of that question may turn on some circumstance of the most trivial and insignificant kind. There is a case in this morning's paper which illustrates this. A gentleman has disappeared rather mysteriously. He was last seen by the servant of a relative at whose house he had called. Now, if this gentleman should never reappear, dead or alive, the question as to what was the latest moment at which he was certainly alive will turn upon the further question: "Was he or was he not wearing a particular article of jewellery when he called at the relative's house?"

He paused with a reflective eye bent upon the stump of chalk he still held; then, noting the expectant interest with which we were regarding him, he resumed:

'The circumstances in this case are very curious; in fact, they are highly mysterious; and if any legal issues should arise in respect of them, they are likely to yield some very remarkable complications. The gentleman who has disappeared, Mr. John Bellingham, is a man well known in archaeological circles. He recently returned from Egypt, bringing with him a very fine collection of antiquities—some of which, by the way, he has presented to the British Museum, where they are now on view—and having made this presentation, he appears to have gone to Paris on business. I may mention that the gift consisted of a very fine mummy and a complete set of tomb-furniture. The latter, however, had not arrived from Egypt at the time when the missing man left for Paris, but the mummy was inspected on the fourteenth of October at Mr. Bellingham's house by Dr. Norbury of the British Museum, in the presence of the donor and his solicitor, and the latter was authorised to hand over the complete collection to the British Museum authorities when the tomb-furniture arrived; which he has done since.

'From Paris he seems to have returned on the twenty-third of November, and to have gone direct to Charing Cross to the house of a relative, a Mr. Hurst, who is a bachelor and lives at Eltham. He appeared at the house at twenty minutes past five, and as Mr. Hurst had not yet come down from town and was not expected until a quarter to six, he explained who he was and said he would wait in the study and write some letters. The housemaid accordingly showed him into the study, furnished him with writing materials, and left him.

'At a quarter to six Mr. Hurst let himself in with his latchkey, and before the housemaid had time to speak to him he had passed through into the study and shut the door.

'At six o'clock, when the dinner bell was rung, Mr. Hurst entered the dining-room alone, and observing the table was laid for two, asked the reason.

"I thought Mr. Bellingham was staying to dinner, sir," was the housemaid's reply.

"Mr. Bellingham!" exclaimed the astonished host. "I didn't know he was here. Why was I not told?"

"I thought he was in the study with you, sir," said the housemaid.

'On this a search was made for the visitor, with the result that he was nowhere to be found. He had disappeared without leaving a trace, and what made the incident more odd was that the housemaid was certain that he had not gone out by the front door. For since neither she nor the cook was acquainted with Mr. John Bellingham, she had remained the whole time either in the kitchen, which commanded a view of the front gate, or in the dining-room, which opened into the hall opposite the study door. The study itself has a French window opening on a narrow grass plot, across which is a side-gate that opens into an alley; and it appears that Mr. Bellingham must have made his exit by this rather eccentric route. At any rate—and this is the important fact—he was not in the house, and no one had seen him leave it.

'After a hasty meal Mr. Hurst returned to town and called at the office of Mr. Bellingham's solicitor and confidential agent, a Mr. Jellicoe, and mentioned the matter to him. Mr. Jellicoe knew nothing of his client's return from Paris, and the two men at once took the train down to Woodford, where the missing man's brother, Mr. Godfrey Bellingham, lives. The servant who admitted them said that Mr. Godfrey was not at home, but that his daughter was in the library, which is a detached building situated in a shrubbery beyond the garden at the back of the house. Here the two men found, not Miss Bellingham, but also her father, who had come in by the back gate.

'Mr. Godfrey and his daughter listened to Mr. Hurst's story with the greatest surprise, and assured him that they had neither seen nor heard anything of John Bellingham.

'Presently the party left the library to walk up to the house; but only a few feet from the library door Mr. Jellicoe noticed an object lying in the grass and pointed it out to Mr. Godfrey.

'The latter picked it up, and they all recognised it as a scarab which Mr. John Bellingham had been accustomed to wear suspended from his watch-chain. There was no mistaking it. It was a very fine scarab of the eighteenth dynasty fashioned of lapis lazuli and engraved with the cartouche of Amenhotep III. It had been suspended by a gold ring fastened to a wire which passed through the suspension hole, and the ring, though broken, was still in position.
‘This discovery of course only added to the mystery, which was still further increased when, on inquiry, a suit-case bearing the initials J. B. was found to be unclaimed in the cloak-room at Charing Cross. Reference to the counterfoil of the ticket-book showed that it had been deposited about the time of the arrival of the Continental express on the twenty-third of November, so that its owner must have gone straight on to Eltham.

‘That is how the affair stands at present, and, should the missing man never reappear or should his body never be found, the question, as you see, which will be required to be settled is, “What is the exact time and place, when and where, he was last known to be alive!” As to the place, the importance of the issues involved in that question are obvious and we need not consider them. But the question of time has another kind of significance. Cases have occurred, as I pointed out in the lecture, in which proof of survivorship by less than a minute has secured succession to property. Now, the missing man was last seen alive at Mr. Hurst’s house at twenty minutes past five on the twenty-third of November. But he appears to have visited his brother’s house at Woodford, and, since nobody saw him at that house, it is at present uncertain whether he went there before calling on Mr. Hurst. If he went there first, then twenty minutes past five on the evening of the twenty-third is the latest moment at which he is known to have been alive; but if he went there after, there would have to be added to this time the shortest time possible in which he could travel from the one house to the other.

‘But the question as to which house he visited first hinges on the scarab. If he was wearing the scarab when he arrived at Mr. Hurst’s house, it would be certain that he went there first; but if it was not then on his watch-chain, a probability would be established that he went first to Woodford. Thus, you see, a question which may conceivably become the most vital moment in determining the succession of property turns on the observation or non-observation by this housemaid of an apparently trivial and insignificant fact.’

‘Has the servant made any statement on this subject, sir?’ I ventured to enquire.

‘Apparently not,’ replied Dr. Thorndyke; ‘at any rate, there is no reference to any such statement in the newspaper report, though otherwise, the case is reported in great detail; indeed, the wealth of detail, including plans of the two houses, is quite remarkable and well worth noting as being in itself a fact of considerable interest.’

‘In what respect, sir, is it of interest?’ one of the students asked.

‘Ah,’ replied Dr. Thorndyke, ‘I think I must leave you to consider that question yourself. This is an untried case, and we mustn’t make free with the actions and motives of individuals.’

‘Does the paper give any description of the missing man, sir?’ I asked.

‘Yes; quite an exhaustive description. Indeed, it is exhaustive to the verge of impropriety, considering that the man may turn up alive and well at any moment. It seems that he has an old Pott’s fracture of the left ankle, a linear, longitudinal scar on each knee—origin not stated, but easily guessed at—and that he has tattooed on his chest in vermilion a very finely and distinctly executed representation of the symbolical Eye of Osiris—or Horus or Ra, as the different authorities have it. There certainly ought to be no difficulty in identifying the body. But we hope that it will not come to that.

‘And now I must really be running away, and so must you; but I would advise you all to get copies of the paper and file them when you have read the remarkably full details. It is a most curious case, and it is highly probable that we shall hear of it again. Good afternoon, gentlemen.’

Dr Thorndyke’s advice appealed to all who heard it, for medical jurisprudence was a live subject at St Margaret’s, and all of us were keenly interested in it. As a result, we sallied forth in a body to the nearest newsvendor’s, and, having each provided himself with a copy of the Daily Telegraph, adjourned together to the Common Room to devour the report and thereafter to discuss the bearings of the case, unhampered by those considerations of delicacy that afflicted our more squeamish and scrupulous teacher.

II. — THE EAVESDROPPER

IT IS one of the canons of correct conduct, scrupulously adhered to (when convenient) by all well-bred persons, that an acquaintance should be initiated by a proper introduction. To this salutary rule, which I have disregarded to the extent of an entire chapter, I now hasten to conform; and the more so inasmuch as nearly two years have passed since my first informal appearance.

Permit me then, to introduce Paul Berkeley, MB, etc., recently—very recently—qualified, faultlessly attired in the professional frock-coat and tall hat, and, at the moment of introduction, navigating with anxious care a perilous strait between a row of well-filled coal-sacks and a colossal tray piled high with kidney potatoes.

The passage of this strait landed me on the terra firma of Fleur-de-Lys Court, where I halted for a moment to consult my visiting list. There was only one more patient for me to see this morning, and he lived at 49, Nevill’s Court, wherever that might be. I turned for information to the presiding deity of the coal shop.

‘Can you direct me, Mrs. Jablett, to Nevill’s Court?’

She could and she did, grasping me confidentially by the arm (the mark remained on my sleeve for weeks) and pointing a shaking forefinger at the dead wall ahead. ‘Nevill’s Court’, said Mrs. Jablett, ‘is a alley, and you goes into it through a archway. It turns out on Fetter Lane on the right and as you goes up, opperssers Bream’s Buildings.’
I thanked Mrs. Jablett and went on my way, glad that the morning round was nearly finished, and vaguely conscious of a growing appetite and of a desire to wash in hot water.

The practice which I was conducting was not my own. It belonged to poor Dick Barnard, an old St Margaret’s man of irrepressible spirits and indifferent physique, who had started only the day before for a trip down the Mediterranean on board a tramp engaged in the currant trade; and this, my second morning’s round, was in some sort a voyage of geographical discovery.

I walked on briskly up Fetter Lane until a narrow arched opening, bearing the superscription ‘Nevill’s Court’, arrested my steps, and here I turned to encounter one of those surprises that lie in wait for the traveller in London by-ways. Expecting to find the grey squalor of the ordinary London court, I looked out from under the shadow of the arch past a row of decent little shops through a vista full of light and colour—a vista of ancient, warm-toned roofs and walls relieved by sunlit foliage. In the heart of London a tree is always a delightful surprise; but here were not only trees, but bushes and even flowers. The narrow footway was bordered by little gardens, which, with their wooden palings and well-kept shrubs, gave to the place an air of quaint and sober rusticity; and even as I entered a bevy of workgirls, with gaily-coloured blouses and hair aflame in the sunlight, brightened up the quiet background like the wild flowers that sprangle a summer hedgerow.

In one of the gardens I noticed that the little paths were paved with what looked like circular tiles, but which, on inspection, I found to be old-fashioned stone ink-bottles, buried bottom upwards; and I was meditating upon the quaint conceit of the forgotten scrivener who had thus adorned his habitation—a law-writer perhaps or an author, or perchance even a poet—when I perceived the number that I was seeking inscribed on a shabby door in a high wall. There was no bell or knocker, so, lifting the latch, I pushed the door open and entered.

But if the court itself had been a surprise, this was a positive wonder, a dream. Here, within earshot of the rumble of Fleet Street, I was in an old-fashioned garden enclosed by high walls and, now that the gate was shut, cut off from all sight and knowledge of the urban world that seethed without. I stood and gazed in delighted astonishment. Sun-gilded trees and flower beds gay with blossom; lupins, snapdragons, nasturtiums, spiry foxgloves, and mighty hollyhocks formed the foreground; over which a pair of sulphur-tinted butterflies flitted, unmindful of a buxom and miraculously clean white cat which pursued them, dancing across the borders and clapping her snowy paws fruitlessly in mid-air. And the background was no less wonderful; a grand old house, dark-eaved and venerable, that must have looked down on this garden when ruffled dandies were borne in sedan chairs through the court, and gentle Izaak Walton, stealing forth from his shop in Fleet Street, strolled up Fetter Lane to ‘go a-angling’ at Temple Mills.

So overpowered was I by this unexpected vision that my hand was on the bottom knob of a row of bell-pulls before I recollected myself; and it was not until a most infernal jangling from within recalled me to my business that I observed underneath it a small brass plate inscribed ‘Miss Oman’.

The door opened with some suddenness and a short, middle-aged woman surveyed me hungrily.

‘Have I rung the wrong bell?’ I asked—foolishly enough, I must admit.

‘How can I tell?’ she demanded. ‘I expect you have. It’s the sort of thing a man would do—ring the wrong bell and then say he’s sorry.’

‘I didn’t go as far as that,’ I retorted. ‘It seems to have had the desired effect, and I’ve made your acquaintance into the bargain.’

‘Whom do you want to see?’ she asked.

‘Mr. Bellingham.’

‘Are you the doctor?’

‘I’m a doctor.’

‘Follow me upstairs,’ said Miss Oman, ‘and don’t tread on the paint.’

I crossed the spacious hall, and, preceded by my conductress, ascended a noble oak staircase, treading carefully on a ribbon of matting that ran up the middle. On the first-floor landing Miss Oman opened a door and, pointing to the room, said, ‘Go in there and wait; I’ll tell her you’re here.’

‘I said Mr. Bellingham—’ I began; but the door slammed on me, and Miss Oman’s footsteps retreated rapidly down the stairs.

It was at once obvious to me that I was in a very awkward position. The room into which I had been shown communicated with another, and though the door of communication was shut, I was unpleasantly aware of a conversation that was taking place in the adjoining room. At first, indeed, only a vague mutter, with a few disjointed phrases, came through the door, but suddenly an angry voice rang out clear and painfully distinct:

‘Yes, I did! And I say it again. Bribery! Collusion! That’s what it amounts to. You want to square me!’

‘Nothing of the kind, Godfrey,’ was the reply in a lower tone; but at this point I coughed emphatically and moved a chair, and the voices subsided once more into an indistinct murmur.
To distract my attention from my unseen neighbours I glanced curiously about the room and speculated upon the personal ties of its occupants. A very curious room it was, with its pathetic suggestion of decayed splendour and old-world dignity; a room full of interest and character and of contrasts and perplexing contradictions. For the most part it spoke of unmistakable though decent poverty. It was nearly bare of furniture, and what little there was was of the cheapest—a small kitchen table and three Windsor chairs (two of them with arms); a threadbare string carpet on the floor, and a cheap cotton cloth on the table; these, with a set of bookshelves, frankly constructed of grocer’s boxes, formed the entire suite. And yet, despite its poverty, the place exhaled an air of homely if rather ascetic comfort, and the taste was irreprouachable. The quiet russet of the table-cloth struck a pleasant harmony with the subdued bluish green of the worn carpet; the Windsor chairs and the legs of the table had been carefully denuded of their glaring varnish and stained a sober brown; and the austerity of the whole was relieved by a ginger jar filled with fresh-cut flowers and set in the middle of the table.

But the contrasts of which I have spoken were most singular and puzzling. There were the bookshelves, for instance, home made and stained at the cost of a few pence, but filled with recent and costly new works on archaeology and ancient art. There were the objects on the mantelpiece: a facsimile in bronze—not bronze plaster—of the beautiful head of Hypnos and a pair of fine Ushabti figures. There were the decorations of the walls, a number of etchings—signed proofs, every one of them—of Oriental subjects, and a splendid facsimile reproduction of an Egyptian papyrus. It was incongruous in the extreme, this mingling of costly refinements with the barest and shabbiest necessities of life, of fastidious culture with manifest poverty. I could make nothing of it. What manner of man, I wondered, was this new patient of mine? Was he a miser, hiding himself and his wealth in this obscure court? An eccentric savant? A philosopher? Or—more probably—a crank? But at this point my meditations were interrupted by the voice from the adjoining room, once more raised in anger.

‘Tut I say that you are making an accusation! You are implying that I made away with him.’

‘Not at all,’ was the reply; ‘but I repeat that it is your business to ascertain what has become of him. The responsibility rests upon you.’

‘Upon me!’ rejoined the first voice. ‘And what about you? Your position is a pretty fishy one if it comes to that.’

‘What!’ roared the other. ‘Do you insinuate that I murdered my own brother?’

During this amazing colloquy I had stood gaping with sheer astonishment. Suddenly I recollected myself, and dropping into a chair, set my elbows on my knees and clapped my hands over my ears; and thus I must have remained for a full minute when I became aware of the closing of a door behind me.

I sprang to my feet and turned in some embarrassment (for I must have looked unspeakably ridiculous) to confront the sombre figure of a rather tall and strikingly handsome girl, who, as she stood with her hand on the knob of the door, saluted me with a formal bow. In an instantaneous glance I noted how perfectly she matched her strange surroundings. Black-robed, black-haired, with black-grey eyes and a grave sad face of ivory pallor, she stood, like one of old Terboch’s portraits, a harmony in tones so low as to be but a step removed from monochrome. Obviously a lady in spite of the worn and rusty dress, and something in the poise of the head and the set of the straight brows hinted at a spirit that adversity had hardened rather than broken.

‘I must ask you to forgive me for keeping you waiting,’ she said; and as she spoke a certain softening at the corners of the austere mouth reminded me of the absurd position in which she had found me.

I murred that the trifling delay was of no consequence whatever; that I had, in fact, been rather glad of the rest; and I was beginning somewhat vaguely to approach the subject of the invalid when the voice from the adjoining room again broke forth with hideous distinctness.

‘I tell you I’ll do nothing of the kind! Why, confound you, it’s nothing less than a conspiracy that you’re proposing!’

Miss Bellingham—as I assumed her to be—stepped quickly across the floor, flushing angrily, as well she might; but, as she reached the door, it flew open and a small, spruce, middle-aged man burst into the room.

‘Your father is mad, Ruth!’ he exclaimed; ‘absolutely stark mad! And I refuse to hold any further communication with him.’

‘The present interview was not of his seeking,’ Miss Bellingham replied coldly.

‘No, it was not,’ was the wrathful rejoinder; ‘it was my mistaken generosity. But there—what is the use of talking? I’ve done my best for you and I’ll do no more. Don’t trouble to let me out; I can find my way. Good-morning.’ With a stiff bow and a quick glance at me, the speaker strode out of the room, banging the door after him.

‘I must apologise for this extraordinary reception,’ said Miss Bellingham; ‘but I believe medical men are not easily astonished. I will introduce you to your patient now.’ She opened the door and, as I followed her into the adjoining room, she said: ‘Here is another visitor for you, dear. Doctor—’

‘Berkeley,’ said I. ‘I am acting for my friend Doctor Barnard.’

The invalid, a fine-looking man of about fifty-five, who sat propped up in bed with a pile of pillows, held out an excessively shaky hand, which I grasped cordially, making a mental note of the tremor.

‘How do you do, sir?’ said Mr. Bellingham. ‘I hope Doctor Barnard is not ill.’

‘Oh, no,’ I answered; ‘he has gone for a trip down the Mediterranean on a currant ship. The chance occurred rather
suddenly, and I bustled him off before he had time to change his mind. Hence my rather unceremonious appearance, which I hope you will forgive.'

'Not at all,' was the hearty response. 'I'm delighted to hear that you sent him off; he wanted a holiday, poor man. And I am delighted to make your acquaintance, too.'

'It is very good of you,' I said; whereupon he bowed as gracefully as a man may who is propped up in bed with a heap of pillows; and having thus exchanged broadsides of civility, so to speak, we—or, at least, I—proceeded to business.

'How long have you been laid up?' I asked cautiously, not wishing to make too evident the fact that my principal had given me no information respecting his case.

'A week to-day,' he replied. 'The fons et origo mail was a hansom-cab which upset me opposite the Law Courts—sent me sprawling in the middle of the road. My own fault, of course—at least, the cabby said so, and I suppose he knew. But that was no consolation to me.'

'Were you hurt much?'

'No, not really; but the fall bruised my knee rather badly and gave me a deuce of a shake up. I'm too old for that sort of thing, you know.'

'Most people are,' said I.

'True; but you can take a cropper more gracefully at twenty than at fifty-five. However, the knee is getting on quite well—you shall see it presently—and you observe that I am giving it complete rest. But that isn't the whole of the trouble or the worst of it. It's my confounded nerves. I'm as irritable as the devil and as nervous as a cat. And I can't get a decent night's rest.'

I recalled the tremulous hand that he had offered me. He did not look like a drinker, but still—

'Do you smoke much?' I inquired diplomatically.

He looked at me slyly and chuckled. 'That's a very delicate way to approach the subject, Doctor,' he said. 'No, I don't smoke much, and I don't crook my little finger. I saw you look at my shaky hand just now—oh, it's all right; I'm not offended. It's a doctor's business to keep lifting his eyelids. But my hand is steady enough as a rule, when I'm not upset, but the least excitement sets me shaking like a jelly. And the fact is that I have just had a deucedly unpleasant interview—'

'I think,' Miss Bellingham interrupted, 'Doctor Berkeley and, in fact, the neighbourhood at large, are aware of the fact.'

Mr. Bellingham laughed rather shamefacedly. 'I'm afraid I did lose my temper,' he said; 'but I am always an impulsive old fellow, Doctor, and when I'm put out I'm apt to speak my mind—a little too bluntly perhaps.'

'And audibly,' his daughter added. 'Do you know that Doctor Berkeley was reduced to the necessity of stopping his ears?' She glanced at me as she spoke, with something like a twinkle in her solemn grey eyes.

'Did I shout?' Mr. Bellingham asked, not very contritely, I thought, though he added: 'I'm very sorry, my dear; but it won't happen again. I think we've seen the last of that good gentleman.'

'I am sure I hope so,' she rejoined, adding: 'And now I will leave you to your talk; I shall be in the next room if you should want me.'

I opened the door for her, and when she had passed out with a stiff little bow I seated myself by the bedside and resumed the consultation. It was evidently a case of breakdown, to which the cab accident had, no doubt, contributed. As to the other antecedents, they were of no concern of mine, though Mr. Bellingham seemed to think otherwise, for he resumed: 'That cab business was the last straw, you know, and it finished me off, but I have been going down the hill for a long time. I've had a lot of trouble during the last two years. But I suppose I oughtn't to pester you with the details of my personal affairs.'

'Anything that bears on your present state of health is of interest to me if you don't mind telling me it,' I said.

'Mind!' he exclaimed. 'Did you ever meet an invalid who didn't enjoy talking about his own health? It's the listener who minds, as a rule.'

'Well, the present listener doesn't,' I said.

'Then,' said Mr. Bellingham, 'I'll treat myself to the luxury of telling you all my troubles; I don't often get the chance of a confidential grumble to a responsible man of my own class. And I really have some excuses for railing at Fortune, as you will agree when I tell you that, a couple of years ago, I went to bed one night a gentleman of independent means and excellent prospects and woke up in the morning to find myself practically a beggar. Not a cheerful experience that, you know, at my time of life, eh?'

'No,' I agreed, 'not at any other.'

'And that was not all,' he continued; 'For at the same moment I lost my brother, my dearest, kindest friend. He disappeared—vanished off the face of the earth; but perhaps you have heard of the affair. The confounded papers were full of it at the time.'

He paused abruptly, noticing, no doubt, a sudden change in my face. Of course, I recollected the case now. Indeed, ever
since I had entered the house some chord of memory had been faintly vibrating, and now his last words had struck out the full note.

'Yes,' I said, 'I remember the incident, though I don't suppose I should but for the fact that our lecturer on medical jurisprudence drew my attention to it.'

'Indeed,' said Mr. Bellingham, rather uneasily, as I fancied. 'What did he say about it?'

'He referred to it as a case that was calculated to give rise to some very pretty legal complications.'

'By Jove!' exclaimed Bellingham, 'that man was a prophet! Legal complications, indeed! But I'll be bound he never guessed at the sort of infernal tangle that has actually gathered round the affair. By the way, what was his name?'

'Thorndyke,' I replied. 'Doctor John Thorndyke.'

'Thorndyke,' Mr. Bellingham repeated in a musing, retrospective tone. 'I seem to remember the name. Yes, of course. I have heard a legal friend of mine, a Mr. Marchmont, speak of him in reference to the case of a man whom I knew slightly years ago—a certain Jeffrey Blackmore, who also disappeared very mysteriously. I remember now that Dr. Thorndyke unravelled that case with most remarkable ingenuity.'

'I daresay he would be very much interested to hear about your case,' I suggested.

'I daresay he would,' was the reply; 'but one can't take up a professional man's time for nothing, and I couldn't afford to pay him. And that reminds me that I'm taking up your time by gossiping about purely personal affairs.'

'My morning round is finished,' said I, 'and, moreover, your personal affairs are highly interesting. I suppose I mustn't ask what is the nature of the legal entanglement?'

'Not unless you are prepared to stay here for the rest of the day and go home a raving lunatic. But I'll tell you this much: the trouble is about my poor brother's will. In the first place it can't be administered because there is not sufficient evidence that my brother is dead; and in the second place, if it could, all the property would go to people who were never intended to benefit. The will itself is the most diabolically exasperating document that was ever produced by the perverted ingenuity of a wrong-headed man. That's all. Will you have a look at my knee?'

As Mr. Bellingham's explanation (delivered in a rapid crescendo and ending almost in a shout) had left him purple-faced and trembling, I thought it best to bring our talk to an end. Accordingly I proceeded to inspect the injured knee, which was now nearly well, and to overhaul my patient generally; and having given him detailed instructions as to his general conduct, I rose and took my leave.

'And remember,' I said as I shook his hand, 'no tobacco, no coffee, no excitement of any kind. Lead a quiet, bovine life.'

'That's all very well,' he grumbled, 'but supposing people come here and excite me?'

'Disregard them,' said I, 'and read Whitaker's Almanack.' And with this parting advice I passed out into the other room.

Miss Bellingham was seated at the table with a pile of blue-covered notebooks before her, two of which were open, displaying pages closely written in a small, neat handwriting. She rose as I entered and looked at me inquiringly.

'I heard you advising my father to read Whitaker's Almanack,' she said. 'Was that a curative measure?'

'Entirely,' I replied. 'I recommended it for its medicinal virtues, as an antidote to mental excitement.'

She smiled faintly. 'It certainly is not a highly emotional book,' she said, and then asked: 'Have you any other instructions to give?'

'Well, I might give the conventional advice—to maintain a cheerful outlook and avoid worry; but I don't suppose you would find it very helpful.'

'No,' she answered bitterly; 'it is a counsel of perfection. People in our position are not a very cheerful class, I'm afraid; but still they don't seek out worries from sheer perverseness. The worries come unsought. But, of course, you can't enter into that.'

'I can't give you any practical help, I fear, though I do sincerely hope that your father's affairs will straighten themselves out soon.'

She thanked me for my good wishes and accompanied me down to the street door, where, with a bow and a rather stiff handshake, she gave me my cong.

Very ungratefully the noise of Fetter Lane smote on my ears as I came out through the archway, and very squalid and unrestful the little street looked when contrasted with the dignity and monastic quiet of the old garden. As to the surgery, with its oileloth floor and walls made hideous with gaudy insurance show-cards in sham gilt frailties, its aspect was so revolting that I flew to the day-book for distraction, and was still busily entering the morning's visits when the bottle-boy, Adolphus, entered stealthily to announce lunch.

III. — JOHN THORNDYKE
THAT THE character of an individual tends to be reflected in his dress is a fact familiar to the least observant. That the observation is equally applicable to aggregates of men is less familiar, but equally true. Do not the members of the fighting professions, even to this day, deck themselves in feathers, in gaudy colours and gilded ornaments, after the manner of the African war-chief or the Redskin ‘brave’, and thereby indicate the place of war in modern civilisation? Does not the Church of Rome send her priests to the altar in habiliments that were fashionable before the fall of the Roman Empire, in token of her immovable conservatism? And, lastly, does not the Law, lumbering on in the wake of progress, symbolise its subjection to precedent by head-gear reminiscent of the good days of Queen Anne?

I should apologise for obtruding upon the reader these somewhat trite reflections; which were set going by the quaint stock-in-trade of the wig-maker’s shop in the cloisters of the Inner Temple, whether I strayed on a sultry afternoon in quest of shade and quiet. I had halted opposite the little shop window, and, with my eyes bent dreamily on the row of wigs, was pursuing the above train of thought when I was startled by a deep voice saying softly in my ear: ‘I’d have the full-bottomed one if I were you.’

I turned swiftly and rather fiercely, and looked into the face of my old friend and fellow-student, Jervis, behind whom, regarding us with a sedate smile, stood my former teacher, Dr. John Thorndyke. Both men greeted me with a warmth that I felt to be very flattering, for Thorndyke was quite a great personage, and even Jervis was several years my academic senior.

‘You are coming in to have a cup of tea with us, I hope,’ said Thorndyke; and as I assented gladly, he took my arm and led me across the court in the direction of the Treasury.

‘But why that hungry gaze at those forensic vanities, Berkeley?’ he asked. ‘Are you thinking of following my example and Jervis’s—deserting the bedside for the Bar?’

‘What! Has Jervis gone in for the law?’ I exclaimed.

‘Bless you, yes!’ replied Jervis. ‘I have become parasitical on Thorndyke! “The big fleas have little fleas”, you know. I am the additional fraction trailing after the whole number in the rear of a decimal point.’

‘Don’t you believe him, Berkeley,’ interposed Thorndyke. ‘He is the brains of the firm. I supply the respectability and moral worth. But you haven’t answered my question. What are you doing here on a summer afternoon staring into a wig-maker’s window?’

‘I am Barnard’s locum; he is in practice in Fetter Lane.’

‘I know,’ said Thorndyke; ‘we meet him occasionally, and very pale and peaky he has been looking of late. Is he taking a holiday?’

‘Yes. He has gone for a trip to the Isles of Greece in a currant ship.’

‘Then,’ said Jervis, ‘you are actually a local GP. I thought you were looking beastly respectable.’

‘And judging from your leisured manner when we encountered you,’ added Thorndyke, ‘the practice is not a strenuous one. I suppose it is entirely local?’

‘Yes,’ I replied. ‘The patients mostly live in the small streets and courts within a half-mile radius of the surgery, and the abodes of some of them are pretty squalid. Oh! and that reminds me of a very strange coincidence. It will interest you, I think.’

‘Life is made up of strange coincidences,’ said Thorndyke. ‘Nobody but a reviewer of novels is ever really surprised at a coincidence. But what is yours?’

‘It is connected with a case that you mentioned to us at the hospital about two years ago, the case of a man who disappeared under rather mysterious circumstances. Do you remember it? The man’s name was Bellingham.’

‘The Egyptianist? Yes, I remember the case quite well. What about it?’

‘The brother is a patient of mine. He is living in Nevill’s Court with his daughter, and they seem to be as poor as church mice.’

‘Really,’ said Thorndyke, ‘this is quite interesting. They must have come down in the world rather suddenly. If I remember rightly, the brother was living in a house of some pretensions standing in its own grounds.’

‘Yes, that is so. I see you recollect all about the case.’

‘My dear fellow,’ said Jervis, ‘Thorndyke never forgets a likely case. He is a sort of medico-legal camel. He gulps down the raw facts from the newspapers or elsewhere, and then, in his leisure moments, he calmly regurgitates them and has a quiet chew at them. It is a quaint habit. A case crops up in the papers or in one of the courts, and Thorndyke swallows it whole. Then it lapses and every one forgets it. A year or two later it crops up in a new form, and, to your astonishment, you find that Thorndyke has got it all cut and dried. He has been ruminating on it periodically in the interval.’

‘You notice,’ said Thorndyke, ‘that my learned friend is pleased to indulge in mixed metaphors. But his statement is substantially true, though obscurely worded. You must tell us more about the Bellinghams when we have fortified you with a cup of tea.’

Our talk had brought us to Thorndyke’s chambers, which were on the first floor of No. 5A, King’s Bench Walk, and as we
entered the fine, spacious, panelled room we found a small, elderly man, neatly dressed in black, setting out the tea-service on the table. I glanced at him with some curiosity. He hardly looked like a servant, in spite of his neat, black clothes; in fact, his appearance was rather puzzling, for while his quiet dignity and his serious, intelligent face suggested some kind of professional man, his neat, capable hands were those of a skilled mechanic.

Thorndyke surveyed the tea-tray thoughtfully and then looked at his retainer. 'I see you have put three tea-cups, Polton,' he said. 'Now, how did you know I was bringing someone in to tea?'

The little man smiled a quaint, crinkly smile of gratification as he explained:

'I happened to look out of the laboratory window as you turned the corner, sir.'

'How disappointingly simple,' said Jervis. 'We were hoping for something abstruse and telepathic.'

'Simplicity is the soul of efficiency, sir,' replied Polton as he checked the tea-service to make sure that nothing was forgotten, and with this remarkable aphorism he silently evaporated.

'To return to the Bellingham case,' said Thorndyke, when he had poured out the tea. 'Have you picked up any facts relating to the parties—and facts, I mean, of course, that it would be proper for you to mention?'

'I have learned one or two things that there is no harm in repeating. For instance, I gather that Godfrey Bellingham—my patient—lost all his property quite suddenly about the time of the disappearance.'

'That is really odd,' said Thorndyke. 'The opposite condition would be quite understandable, but one doesn't see exactly how this can have happened, unless there was an allowance of some sort.'

'No, that was what struck me. But there seem to be some queer features in the case, and the legal position is evidently getting complicated. There is a will, for example, which is giving trouble.'

'They will be hardly able to administer the will without either proof or presumption of death,' Thorndyke remarked.

'Exactly. That's one of the difficulties. Another is that there seems to be some fatal drafting of the will itself. I don't know what it is, but I expect I shall hear sooner or later. By the way, I mentioned the interest that you have taken in the case, and I think Bellingham would have liked to consult you, but, of course, the poor devil has no money.'

'That is awkward for him if the other interested parties have, There will probably be legal proceedings of some kind, and as the law takes no account of poverty, he is likely to go to the wall. He ought to have advice of some sort.'

'I don't see how he is to get it,' said I.

'Neither do I,' Thorndyke admitted. 'There are no hospitals for impecunious litigants; it is assumed that only persons of means have a right to go to law. Of course, if we knew the man and the circumstances we might be able to help him; but for all we know to the contrary, he may be an arrant scoundrel.'

I had recalled the strange conversation that I had overheard, and wondered what Thorndyke would have thought of it if it had been allowable for me to repeat it. Obviously it was not, however, and I could only give my own impressions.

'He doesn't strike me as that,' I said; 'but, of course, one never knows. Personally, he impressed me rather favourably, which is more than the other man did.'

'What other man?' asked Thorndyke.

'There was another man in the case, wasn't there? I forget his name. I saw him at the house and didn't much like the look of him. I suspect he's putting some sort of pressure on Bellingham.'

'Berkeley knows more about this than he's telling us,' said Jervis. 'Let us look up the report and see who this stranger is.'

He took down from a shelf a large volume of newspaper cuttings and laid it on the table.

'You see,' said he, as he ran his finger down the index. 'Thorndyke files all the cases that are likely to come to something, and I know he had expectations regarding this one. I fancy he had some ghoulish hope that the missing gentleman's head might turn up in somebody's dust-bin. Here we are; the other man's name is Hurst. He is apparently a cousin, and it was at his house the missing man was last seen alive.'

'So you think Mr. Hurst is moving in the matter?' said Thorndyke, when he had glanced over the report.

'That is my impression,' I replied, 'though I really know nothing about it.'

'Well,' said Thorndyke, 'if you should learn what is being done and should have permission to speak of it, I shall be very interested to hear how the case progresses; and if an unofficial opinion on any point would be of service, I think there would be no harm in giving it.'

'It would certainly be of great value if the other parties are taking professional advice,' I said; and then, after a pause, I asked: 'Have you given this case much consideration?'

Thorndyke reflected. 'No,' he said, 'I can't say that I have. I turned it over rather carefully when the report first appeared, and I have speculated on it occasionally since. It is my habit, as Jervis was telling you, to utilise odd moments of leisure (such as a railway journey, for instance) by constructing theories to account for the facts of such obscure cases as have come to my notice. It is a useful habit, I think, for, apart from the mental exercise and experience that one gains from it, an
appreciable portion of these cases ultimately comes into my hands, and then the previous consideration of them is so much time gained.

'Have you formed any theory to account for the facts in this case?' I asked.

'Yes; I have several theories, one of which I especially favour, and I am awaiting with great interest such new facts as may indicate to me which of these theories is probably the correct one.'

'It's no use your trying to pump him, Berkeley,' said Jervis. 'He is fitted with an information valve that opens inwards. You can pour in as much as you like, but you can't get any out.'

Thorndyke chuckled. 'My learned friend is, in the main, correct,' he said. 'You see, I may be called upon any day to advise on this case, in which event I should feel remarkably foolish if I had already expounded my views in detail. But I should like to hear what you and Jervis make of the case as reported in the newspapers.'

'There now,' exclaimed Jervis, 'what did I tell you? He wants to suck your brains.'

'As far as my brain is concerned,' I said, 'the process of suction isn't likely to yield much except vacuum, so I will resign in favour of you. You are a full-blown lawyer, whereas I am only a simple GP.'

Jervis filled his pipe with deliberate care and lighted it. Then, blowing a slender stream of smoke into the air, he said:

'If you want to know what I make of the case from that report, I can tell you in one word—nothing. Every road seems to end in a cul-de-sac.'

'Oh, come!' said Thorndyke, 'this is mere laziness. Berkeley wants to witness a display of your forensic wisdom. A learned counsel may be in a fog—he very often is—but he doesn't state the fact baldly; he wraps it up in a decent verbal disguise. Tell us how you arrive at your conclusion. Show us that you have really weighed the facts.'

'Very well,' said Jervis, 'I will give you a masterly analysis of the case—leading to nothing.' He continued to puff at his pipe for a time with slight embarrassment, as I thought—and I fully sympathised with him. Finally he blew a little cloud and commenced:

'The position appears to be this: Here is a man seen to enter a certain house, who is shown into a certain room, and shut in. He is not seen to come out, and yet, when the room is next entered, it is found to be empty; and that man is never seen again, alive or dead. That is a pretty tough beginning.

'Now, it is evident that one of three things must have happened. Either he must have remained in that room, or at least in that house, alive; or he must have died, naturally or otherwise, and his body have been concealed; or he must have left the house unobserved. Let us take the first case. Now, he couldn't have remained alive in the house for two years. This affair happened nearly two years ago. He would have been noticed. The servants, for instance, when cleaning out the rooms, would have observed him.'

Here Thorndyke interposed with an indulgent smile at his junior: 'My learned friend is treating the inquiry with unbecoming levity. We accept the conclusion that the man did not remain in the house alive.'

'Very well. Then did he remain in it dead? Apparently not. The report says that as soon as the man was missed, Hurst and the servants together searched the house thoroughly. But there had been no time or opportunity to dispose of the body, whence the only possible conclusion is that the body was not there. Moreover, if we admit the possibility of his having been murdered—for that is what concealment of the body would imply—there is the question: Who could have murdered him? Not the servants, obviously, and as to Hurst—well, of course, we don't know what his relations with the missing man may have been—at least, I don't.'—

'Neither do I,' said Thorndyke. 'I know nothing beyond what is in the newspaper report and what Berkeley has told us.'

'Then we know nothing. He may have had a motive for murdering the man or he may not. The point is that he doesn't seem to have had the opportunity. Even if we suppose that he managed to conceal the body temporarily, still there was the final disposal of it. He couldn't have buried it in the garden with the servants about; neither could he have burned it. The only conceivable method by which he could have got rid of it would have been that of cutting it up into fragments and burying the dismembered parts in some secluded spots or dropping them into ponds or rivers. But no remains of the kind have been found, as some of them probably would have been by now, so that there is nothing to support this suggestion; indeed, the idea of murder, in this house at least, seems to be excluded by the search that was made the instant the man was missed.

'Then take the third alternative: Did he leave the house unobserved? Well, it is not impossible, but it would be a queer thing to do. He may have been an impulsive or eccentric man. We can't say. We know nothing about him. But two years have clapsed and he has never turned up, so that if he left the house secretly he must have gone into hiding and be hiding still. Of course, he may have been the sort of lunatic who would behave in that manner or he may not. We have no information as to his personal character.

'Then there is the complication of the scarab that was picked up in the grounds of his brother's house at Woodford. That seems to show that he visited that house at some time. But no one admits having seen him there; and it is uncertain, therefore, whether he went first to his brother's house or to Hurst's. If he was wearing the scarab when he arrived at the Eltham house, he must have left that house unobserved and gone to Woodford; but if he was not wearing it he probably
went from Woodford to Eltham, and there finally disappeared. As to whether he was or was not wearing the scarab when he was last seen alive by Hurst’s housemaid, there is at present no evidence.

‘If he went to his brother’s house after his visit to Hurst, the disappearance is more understandable if we don’t mind flinging accusations of murder about rather casually; for the disposal of the body would be much less difficult in that case. Apparently no one saw him enter the house, and, if he did enter, it was by a back gate which communicated with the library—a separate building some distance from the house. In that case it would have been physically possible for the Bellinghams to have made away with him. There was plenty of time to dispose of the body unobserved—temporarily, at any rate. Nobody had seen him come to the house, and nobody knew that he was there—if he was there; and apparently no search was made either at the time or afterwards. In fact, if it could be shown that the missing man left Hurst’s house alive, or that he was wearing the scarab when he arrived there, things would look rather fishy for the Bellinghams—for, of course, the girl must have been in it if the father was. But there’s the crux: there is no proof that the man ever did leave Hurst’s house alive. And if he didn’t—but there! as I said at first, whichever turning you take, you find that it ends in a blind alley.’—

‘A lame ending to a masterly exposition,’ was Thorndyke’s comment.

‘I know,’ said Jervis. ‘But what would you have? There are quite a number of possible solutions, and one of them must be the true one. But how are we to judge which it is? I maintain that until we know something of the parties and the financial and other interests involved we have no data.’

‘There,’ said Thorndyke, ‘I disagree with you entirely. I maintain that we have ample data. You say that we have no means of judging which of the various possible solutions is the true one; but I think that if you read the report carefully and thoughtfully you will find that the facts now known point clearly to one explanation, and one only. It may not be the true explanation, and I don’t suppose it is. But we are now dealing with the matter speculatively, academically, and I contend that our data yield a definite conclusion. What do you say, Berkeley?’

‘I say that it is time for me to be off; the evening consultations begin at half-past six.’

‘Well,’ said Thorndyke, ‘don’t let us keep you from your duties, with poor Barnard currant-picking in the Grecian Isles. But come in and see us again. Drop in when you like after your work is done. You won’t be in our way even if we are busy, which we very seldom are after eight o’clock.’

I thanked Dr. Thorndyke most heartily for making me free of his chambers in this hospitable fashion and took my leave, setting forth homewards by way of Middle Temple Lane and the Embankment; not a very direct route for Fetter Lane, it must be confessed; but our talk had revived my interest in the Bellingham household and put me in a reflective vein.

From the remarkable conversation that I had overheard it was evident that the plot was thickening. Not that I supposed that these two respectable gentlemen really suspected one another of having made away with the missing man; but still, their unguarded words, spoken in anger, made it clear that each had allowed the thought of sinister possibilities to enter his mind—a dangerous condition that might easily grow into actual suspicion. And then the circumstances really were highly mysterious, as I realised with especial vividness now after listening to my friend’s analysis of the evidence.

From the problem itself my mind travelled, not for the first time during the last few days, to the handsome girl, who had seemed in my eyes the high-priestess of this temple of mystery in the quaint little court. What a strange figure she had made against this strange background, with her quiet, chilly, self-contained manner, her pale face, so sad and worn, her black, straight brows and solemn grey eyes, so inscrutable, mysterious, Sibylline. A striking, even impressive, personality this, I reflected, with something in it sombre and enigmatic that attracted and yet repelled.

And here I recalled Jervis’s words: ‘The girl must have been in it if the father was.’ It was a dreadful thought, even though only speculatively uttered, and my heart rejected it; rejected it with indignation that rather surprised me. And this notwithstanding that the sombre black-robed figure that my memory conjured up was one that associated itself with the idea of mystery and tragedy.

IV. — LEGAL COMPLICATIONS AND A JACKAL

MY MEDITATIONS brought me by a circuitous route, and ten minutes late, to the end of Fetter Lane, where, exchanging my rather abstracted air for the alert manner of a busy practitioner, I strode briskly forward and darted into the surgery with knitted brows, as though just released from an anxious case. But there was only one patient waiting, and she saluted me as I entered with a snort of defiance.

‘Here you are, then?’ said she.

‘You are perfectly correct, Miss Oman,’ I replied; ‘in fact, you have put the case in a nutshell. What can I have the pleasure of doing for you?’

‘Nothing,’ was the answer. ‘My medical adviser is a lady; but I’ve brought a note from Mr. Bellingham. Here it is,’ and she thrust the envelope into my hand.

I glanced through the note and learned that my patient had had a couple of bad nights and a very harassing day. ‘Could I have something to give me a night’s rest?’ it concluded.

I reflected for a few moments. One is not very ready to prescribe sleeping draughts for unknown patients, but still,
insomnia is a very distressing condition. In the end I temporised with a moderate dose of bromide, deciding to call and see if more energetic measures were necessary.

‘He had better take a dose of this at once, Miss Oman,’ said I, as I handed her the bottle, ‘and I will look in later and see how he is.’

‘I expect he will be glad to see you,’ she answered, ‘for he is all alone to-night and very dumpy. Miss Bellingham is out. But I must remind you that he’s a poor man and pays his way. You must excuse my mentioning it.’

‘I am much obliged to you for the hint, Miss Oman,’ I rejoined. ‘It isn’t necessary for me to see him, but I should like just to look in and have a chat.’

‘Yes, it will do him good. You have your points, though punctuality doesn’t seem to be one of them,’ and with this parting shot Miss Oman bustled away.

Half-past eight found me ascending the great, dim staircase the house in Nevill’s Court preceded by Miss Oman, by whom I was ushered into the room. Mr. Bellingham, who had just finished some sort of meal, was sitting hunched up in his chair gazing gloomily into the empty grate. He brightened up as I entered, but was evidently in very low spirits.

‘I didn’t mean to drag you out after your day’s work was finished,’ he said, ‘though I am very glad to see you.’

‘You haven’t dragged me out. I heard you were alone, so I just dropped in for a few minutes’ gossip.’

‘That is really kind of you,’ he said heartily. ‘But I’m afraid you’ll find me rather poor company. A man who is full of his own highly disagreeable affairs is not a desirable companion.’

‘You mustn’t let me disturb you if you’d rather be alone,’ said I, with a sudden fear that I was intruding.

‘Oh, you won’t disturb me,’ he replied; adding, with a laugh: ‘It’s more likely to be the other way about. In fact, if I were not afraid of boring you to death I would ask you to let me talk my difficulties over with you.’

‘You won’t bore me,’ I said. ‘It is generally interesting to share another man’s experiences without their inconveniences. The proper study of mankind is—man,’ you know, especially to a doctor.’

Mr. Bellingham chuckled grimly. ‘You make me feel like a microbe,’ he said. ‘However, if you would care to take a peep at me through your microscope, I will crawl on to the stage for your inspection, though it is not my actions that furnish the materials for your psychological studies. It is my poor brother who is the Deus ex machina, who, from his unknown grave, as I fear, pulls the strings of this infernal puppet-show.’

He paused and for a space gazed thoughtfully into the grate as if he had forgotten my presence. At length he looked up and resumed:

‘It is a curious story, Doctor—a very curious story. Part of it you know—the middle part. I will tell you it from the beginning, and then you will know as much as I do; for, as to the end, that is known to no one. It is written, no doubt, in the book of destiny, but the page has yet to be turned.

‘The mischief began with my father’s death. He was a country clergyman of very moderate means, a widower with two children, my brother John and me. He managed to send us both to Oxford, after which John went into the Foreign Office and I was to have gone into the Church. But I suddenly discovered that my views on religion had undergone a change that made this impossible, and just about this time my father came into a quite considerable property. Now, as it was his expressed intention to leave the estate equally divided between my brother and me, there was no need for me to take up any profession for a livelihood. Archaeology was already the passion of my life, and I determined to devote myself henceforth to my favourite study, in which, by the way, I was following a family tendency; for my father was an enthusiastic student of ancient Oriental history, and John was, as you know, an ardent Egyptologist.

‘Then my father died quite suddenly, and left no will. He had intended to have one drawn up, but had put it off until it was too late. And since nearly all the property was in the form of real estate, my brother inherited practically the whole of it. However, in deference to the known wishes of my father, he made me an allowance of five hundred a year, which was about a quarter of the annual income. I urged him to assign me a lump sum, but he refused to do this. Instead, he instructed his solicitor to pay me an allowance in quarterly instalments during the rest of his life; and it was understood that, on his death, the entire estate should devolve on me, or if I died first, on my daughter, Ruth. Then, as you know, he disappeared suddenly, and as the circumstances suggested that he was dead, and there was no evidence that he was alive, his solicitor—a Mr. Jellicoe—found himself unable to continue the payment of the allowance. On the other hand, as there was no positive evidence that my brother was dead, it was impossible to administer the will.’

‘You say the circumstances suggested that your brother was dead. What circumstances were they?’

‘Principally the suddenness and completeness of the disappearance. His luggage, as you may remember, was found lying unclaimed at the railway station; and there was another circumstance even more suggestive. My brother drew a pension from the Foreign Office, for which he had to apply in person, or, if abroad, produce proof that he was alive on the date when the payment became due. Now, he was exceedingly regular in this respect; in fact, he had never been known to fail, either to appear in person or to transmit the necessary documents to his agent, Mr. Jellicoe. But from the moment when he vanished so mysteriously to the present day, nothing whatever has been heard of him.’

‘It’s a very awkward position for you,’ I said, ‘but I should think there will not be much difficulty in obtaining the
permission of the Court to presume death and to proceed to prove the will."

Mr. Bellingham made a wry face. 'I expect you are right,' he said, 'but that doesn’t help me much. You see, Mr. Jellicoe, having waited a reasonable time for my brother to reappear, took a very unusual but, I think, in the special circumstances, a very proper step: he summoned me and the other interested party to his office and communicated to us the provisions of the will. And very extraordinary provisions they turned out to be. I was thunderstruck when I heard them. And the exasperating thing is that I feel sure my poor brother imagined that he had made everything perfectly safe and simple."

'They generally do,' I said, rather vaguely.

'I suppose they do,' said Mr. Bellingham; 'but poor John has made the most infernal hash of his will, and I am certain that he has utterly defeated his own intentions. You see, we are an old London family. The house in Queen Square where my brother nominally lived, but actually kept his collection, has been occupied by us for generations, and most of the Bellinghams are buried in St George’s burial-ground close by, though some members of the family are buried in other churchyards in the neighbourhood. Now, my brother—who, by the way, was a bachelor—had a strong feeling for the family traditions, and he stipulated, not unnaturally, in his will that he should be buried in St George’s burial-ground among his ancestors, or, at least, in one of the places of burial appertaining to his native parish. But instead of simply expressing the wish and directing his executors to carry it out, he made it a condition affecting the operation of the will."

'Affecting it in what respect?' I asked.

'In a very vital respect,' answered Mr. Bellingham. 'The bulk of the property he bequeathed to me, or if I predeceased him, to my daughter Ruth. But the bequest was subject to the condition I have mentioned—that he should be buried in a certain place—and if that condition was not fulfilled, the bulk of the property was to go to my cousin, George Hurst.'

'But in that case,' said I, 'as you can’t produce the body, neither of you can get the property.'

'I am not so sure of that,' he replied. 'If my brother is dead, it is pretty certain that he is not buried in St George’s or any of the other places mentioned, and the fact can easily be proved by; production of the registers. So that a permission to presume death would result in the handing over to Hurst of almost the entire estate.'

'Who is the executor?' I asked.

'Ah!' he exclaimed, 'there is another muddle. There are two executors; Jellicoe is one, and the other is the principal beneficiary—Hurst or myself, as the case may be. But, you see, neither of us can become an executor until the Court has decided which of us is the principal beneficiary.'

'But who is to apply to the Court? I thought that was the business of the executors.'

'Exactly, that is Hurst’s difficulty. We were discussing it when you called the other day, and a very animated discussion it was,' he added, with a grim smile. 'You see, Jellicoe naturally refuses to move in the matter alone. He says he must have the support of the other executor. But Hurst is not at present the other executor; neither am I. But the two of us together are the co-executor, since the duty devolves upon one or other of us, in any case.'

'It’s a complicated position,' I said.

'It is; and the complication has elicited a very curious proposal from Hurst. He points out—quite correctly, I am afraid—that as the conditions as to burial have not been complied with, the property must come to him, and he proposes a very neat little arrangement, which is this: That I shall support him and Jellicoe in their application for permission to presume death and to administer the will, and that he shall pay me four hundred a year for life; the arrangement to hold good in all eventualities.'

'What does he mean by that?'

'He means,' said Bellingham, fixing me with a ferocious scowl, 'that if the body should turn up at any future time, so that the conditions as to burial should be able to be carried out, he should still retain the property and pay me the four hundred a year.'—

'The deuce!' said I. 'He seems to know how to drive a bargain.'

'His position is that he stands to lose four hundred a year for the term of my life if the body is never found, and he ought to stand to win if it is.'

'And I gather that you have refused this offer?'

'Yes; very emphatically, and my daughter agrees with me; but I am not sure that I have done the right thing. A man should think twice, I suppose, before he burns his boats.'

'Have you spoken to Mr. Jellicoe about the matter?'

'Yes, I have been to see him to-day. He is a cautious man, and he doesn’t advise me one way or the other. But I think he disapproves of my refusal; in fact, he remarked that a bird in the hand is worth two in the bush, especially when the whereabouts of the bush is unknown.'

'Do you think he will apply to the Court without your sanction?'

'He doesn’t want to; but I suppose, if Hurst puts pressure on him, he will have to. Besides, Hurst, as an interested party,
could apply on his own account, and after my refusal he probably will; at least, that is Jellicoe’s opinion.’

‘The whole thing is a most astonishing muddle,’ I said, ‘especially when one remembers that your brother had a lawyer to advise him. Didn’t Mr. Jellicoe point out to him how absurd the provisions were?’

‘Yes, he did. He tells me that he implored my brother to let him draw up a will embodying the matter in a reasonable form. But John wouldn’t listen to him. Poor old fellow! he could be very pigheaded when he chose.’

‘And is Hurst’s proposal still open?’

‘No, thanks to my peppery temper. I refused it very definitely, and sent him off with a flea in his ear. I hope I have not made a false step; I was quite taken by surprise when Hurst made the proposal and got rather angry. You remember, my brother was last seen alive at Hurst’s house—but there, I oughtn’t to talk like that, and I oughtn’t to pester you with my confounded affairs when you come in for a friendly chat, though I gave you fair warning, you remember.’

‘Oh, but you have been highly entertaining. You don’t realise what an interest I take in your case.’

Mr. Bellingham laughed somewhat grimly. ‘My case!’ he repeated. ‘You speak as if I were some rare and curious sort of criminal lunatic. However, I’m glad you find me amusing. It’s more than I find myself.’

‘I didn’t say amusing; I said interesting. I view you with deep respect as the central figure of a stirring drama. And I am not the only person who regards you in that light. Do you remember my speaking to you of Doctor Thorndyke?’

‘Yes, of course I do.’

‘Well, oddly enough, I met him this afternoon and we had a long talk at his chambers. I took the liberty of mentioning that I had made your acquaintance. Did I do wrong?’

‘No. Certainly not. Why shouldn’t you tell him? Did he remember my infernal case, as you call it?’

‘Perfectly, in all its details. He is quite an enthusiast, you know, and uncommonly keen to hear how the case develops.’

‘So am I, for that matter,’ said Mr. Bellingham.

‘I wonder,’ said I, ‘if you would mind my telling him what you have told me to-night? It would interest him enormously.’

Mr. Bellingham reflected for a while with his eyes fixed on the empty grate. Presently he looked up, and said slowly:

‘I don’t know why I should. It’s no secret; and if it were, I hold no monopoly on it. No; tell him, if you think he’d care to hear about it.’

‘You needn’t be afraid of his talking,’ I said. ‘He’s as close as an oyster; and the facts may mean more to him than they do to us. He may be able to give a useful hint or two.’

‘Oh, I’m not going to pick his brains,’ Mr. Bellingham said quickly and with some wrath. ‘I’m not the sort of man who goes round cadging for free professional advice. Understand that, Doctor?’

‘I do,’ I answered hastily. ‘That wasn’t what I meant at all. Is that Miss Bellingham coming in? I heard the front door shut.’

‘Yes, that will be my girl, I expect; but don’t run away. You’re not afraid of her, are you?’ he added as I hurriedly picked up my hat.

‘I’m not sure that I’m not,’ I answered. ‘She is rather a majestic young lady.’

Mr. Bellingham chuckled and smothered a yawn, and at that moment his daughter entered the room; and, in spite of her shabby black dress and a shabbier handbag that she carried, I thought her appearance and manner fully justified my description.

‘You come in, Miss Bellingham,’ I said as she shook my hand with cool civility, ‘to find your father yawning and me taking my departure. So I have my uses, you see. My conversation is the infallible cure for insomnia.’

Miss Bellingham smiled. ‘I believe I am driving you away,’ she said.

‘Not at all,’ I replied hastily. ‘My mission was accomplished, that was all.’

‘Sit down for a few moments, Doctor,’ urged Mr. Bellingham, ‘and let Ruth sample the remedy. She will be affronted if you run away as soon as she comes in.’

‘Well, you mustn’t let me keep you up,’ I said.

‘Oh, I’ll let you know when I fall asleep,’ he replied, with a chuckle; and with this understanding I sat down again—not at all unwillingly.

At this moment Miss Oman entered with a small tray and a smile of which I should not have supposed her capable.

‘You’ll take your toast and cocoa while they’re hot, dear, won’t you?’ she said coaxingly.

‘Yes, I will, Phyllis, thank you,’ Miss Bellingham answered. ‘I am only just going to take off my hat,’ and she left the room, followed by the astonishingly transfigured spinster.

She returned almost immediately as Mr. Bellingham was in the midst of a profound yawn, and sat down to her frugal
meal, when her father mystified me considerably by remarking:

‘You’re late to-night, chick. Have the Shepherd Kings been giving trouble?’

‘No,’ she replied; ‘but I thought I might as well get them done. So I dropped in at the Ormond Street library on my way home and finished them.’

‘Then they are ready for stuffing now?’

‘Yes.’ As she answered she caught my astonished eye (for a stuffed Shepherd King is undoubtedly a somewhat surprising phenomenon) and laughed softly.

‘We mustn’t talk in riddles like this,’ she said, ‘before Doctor Berkeley, or he will turn us both into pillars of salt. My father is referring to my work,’ she explained to me.

‘Are you a taxidermist, then?’ I asked.

She hastily set down the cup that she was raising to her lips and broke into a ripple of quiet laughter.

‘I am afraid my father has misled you with his irreverent expressions. He will have to atone by explaining.’

‘You see, Doctor,’ said Mr. Bellingham, ‘Ruth is a literary searcher—’

‘Oh, don’t call me a searcher!’ Miss Bellingham protested. ‘It suggests the female searcher at a police-station. Say investigator.’

‘Very well, investigator or investigatrix, if you like. She hunts up references and bibliographies at the Museum for people who are writing books. She looks up everything that has been written on a given subject, and then, when she has crammed herself to a bursting-point with facts, she goes to her client and disgorges and cram[s] him or her, and he or she finally disgorges into the Press.’

‘What a disgusting way to put it!’ said his daughter. ‘However, that is what it amounts to. I am a literary jackal, a collector of provender for the literary lions. Is that quite clear?’

‘Perfectly. But I don’t think that, even now, I quite understand about the stuffed Shepherd Kings.’

‘Oh, it was not the Shepherd Kings who were to be stuffed. It was the author! That was mere obscurity of speech on the part of my father. The position is this: A venerable Archdeacon wrote an article on the patriarch Joseph—’

‘And didn’t know anything about him,’ interrupted Mr. Bellingham, ‘and got tripped up by a specialist who did, and then got shirty—’

‘Nothing of the kind,’ said Miss Bellingham. ‘He knew as much as venerable archdeacons ought to know; but the expert knew more. So the archdeacon commissioned me to collect the literature on the state of Egypt at the end of the seventeenth dynasty, which I have done; and to-morrow I shall go and stuff him, as my father expresses it, and then—’

‘And then,’ Mr. Bellingham interrupted, ‘the archdeacon will rush forth and pelt that expert with Shepherd Kings and Sequenen-Ra and the whole tag-rag and bobtail of the seventeenth dynasty. Oh, there’ll be wigs on the green, I can tell you.’

‘Yes, I expect there will be quite a skirmish,’ said Miss Bellingham. And thus dismissing the subject she made an energetic attack on the toast while her father refreshed himself with a colossal yawn.

I watched her with furtive admiration and deep and growing interest. In spite of her pallor, her weary eyes, and her drawn and almost haggard face, she was an exceedingly handsome girl; and there was in her aspect a suggestion of purpose, of strength and character that marked her off from the rank and file of womanhood. I noted this as I stole an occasional glance at her or turned to answer some remark addressed to me; and I noted, too, that her speech, despite a general undertone of depression, was yet not without a certain caustic, ironical humour. She was certainly a rather enigmatical young person, but very decidedly interesting.

When she had finished her repast she put aside the tray and, opening the shabby handbag, asked:

‘Do you take any interest in Egyptian history? We are as mad as hatters on the subject. It seems to be a family complaint.’

‘I don’t know much about it,’ I answered. ‘Medical studies are rather engrossing and don’t leave much time for general reading.’

‘Naturally,’ she said. ‘You can’t specialise in everything. But if you would care to see how the business of a literary jackal is conducted, I will show you my notes.’

I accepted the offer eagerly (not, I fear, from pure enthusiasm for the subject), and she brought forth from the bag four blue-covered, quarto notebooks, each dealing with one of the four dynasties from the fourteenth to the seventeenth. As I glanced through the neat and orderly extracts with which they were filled we discussed the intricacies of the peculiarly difficult and confused period that they covered, gradually lowering our voices as Mr. Bellingham’s eyes closed and his head fell against the back of his chair. We had just reached the critical reign of Apepa II when a resounding snore broke in upon the studious quiet of the room and sent us both into a fit of silent laughter.
'Your conversation has done its work,' she whispered as I stealthily picked up my hat, and together we stole on tiptoe to the door, which she opened without a sound. Once outside, she suddenly dropped her bantering manner and said quite earnestly:

'How kind it was of you to come and see him to-night! You have done him a world of good, and I am most grateful. Good-night!'

She shook hands with me really cordially, and I took my way down the creaking stairs in a whirl of happiness that I was quite at a loss to account for.

V. — THE WATERCRESS-BED

BARNARD'S PRACTICE, like most others, was subject to those fluctuations that fill the struggling practitioner alternately with hope and despair. The work came in paroxysms with intervals of almost complete stagnation. One of these intermissions occurred on the day after my visit to Nevill's Court, with the result that by half-past eleven I found myself wondering what I should do with the remainder of the day. The better to consider this weighty problem, I strolled down to the Embankment, and, leaning on the parapet, contemplated the view across the river; the grey stone bridge with its perspective of arches, the picturesque pile of the shot-towers, and beyond, the shadowy shapes of the Abbey and St Stephen's.

It was a pleasant scene, restful and quiet, with a touch of life and a hint of sober romance, when a barge swept down through the—middle arch of the bridge with a lug-sail hoisted to a jury mast and a white-aproned woman at the tiller. Dreamily I watched the craft creep by upon the moving tide, noted the low freeboard, almost awash, the careful helmswoman, and the dog on the forecastle yapping at the distant shore—and thought of Ruth Bellingham.

What was there about this strange girl that had made so deep an impression on me? That was the question that I propounded to myself, and not for the first time. Of the fact itself there was no doubt. But what was the explanation? Was it her unusual surroundings? Her occupation and rather recondite learning? Her striking personality and exceptional good looks? Or her connection with the dramatic mystery of her lost uncle?

I concluded that it was all of these. Everything connected with her was unusual and arresting; but over and above these circumstances there was a certain sympathy and personal affinity of which I was strongly conscious and of which I dimly hoped that she, perhaps, was a little conscious too. At any rate, I was deeply interested in her; of that there was no doubt whatever. Short as our acquaintance had been, she held a place in my thoughts that had never been held by any other woman.

From Ruth Bellingham my reflections passed by a natural transition to the curious story that her father had told me. It was a queer affair, that ill-drawn will, with the baffled lawyer protesting in the background. It almost seemed as if there must be something behind it all, especially when I remembered Mr. Hurst's very singular proposal. But it was out of my depth; it was a case for a lawyer, and to a lawyer it should go. This very night, I resolved, I would go to Thorndyke and give him the whole story as it had been told to me.

And then there happened one of those coincidences at which we all wonder when they occur, but which are so frequent as to have become enshrined in a proverb. For even as I formed the resolution, I observed two men approaching from the direction of Blackfriars, and recognised in them my quondam teacher and his junior.

'I was just thinking about you,' I said as they came up.

'Very flattering,' replied Jervis; 'but I thought you had to talk of the devil.'

'Perhaps,' suggested Thorndyke, 'he was talking to himself. But why were you thinking of us, and what was the nature of your thoughts?'

'My thoughts had reference to the Bellingham case. I spent the whole of last evening at Nevill's Court.'

'Ha! And are there any fresh developments?'

'Yes, by Jove! there are. Bellingham gave me a full detailed description of the will; and a pretty document it seems to be.'

'Did he give you permission to repeat the details to me?'

'Yes. I asked specifically if I might, and he had no objection whatever.'

'Good. We are lunching at Soho to-day as Polton has his hands full. Come with us and share our table and tell us your story as we go. Will that suit you?'

It suited me admirably in the present state of the practice, and I accepted the invitation with undissembled glee.

'Very well,' said Thorndyke; 'then let us walk slowly and finish with matters confidential before we plunge into the madding crowd.'

We set forth at a leisurely pace along the broad pavement and I commenced my narration. As well as I could remember, I related the circumstances that had led up to the present disposition of the property and then proceeded to the actual provisions of the will; to all of which my two friends listened with rapt interest, Thorndyke occasionally stopping me to jot
down a memorandum in his pocket-book.

‘Why, the fellow must have been a stark lunatic!’ Jervis exclaimed, when I had finished. ‘He seems to have laid himself out with the most devilish ingenuity to defeat his own ends.’

‘That is not an uncommon peculiarity with testators,’ Thorndyke remarked. ‘A direct and perfectly intelligible will is rather the exception. But we can hardly judge until we have seen the actual document. I suppose Bellingham hasn’t a copy?’

‘I don’t know,’ said I; ‘but I will ask him.’

‘If he has one, I should like to look through it,’ said Thorndyke. ‘The provisions are very peculiar, and, as Jervis says, admirably calculated to defeat the testator’s wishes if they have been correctly reported. And, apart from that, they have a remarkable bearing on the circumstances of the disappearance. I daresay you noticed that.’

‘I noticed that it is very much to Hurst’s advantage that the body has not been found.’

‘Yes, of course. But there are some other points that are very significant. However, it would be premature to discuss the terms of the will until we have seen the actual document or a certified copy.’

‘If there is a copy extant,’ I said, ‘I will try to get hold of it. But Bellingham is terribly afraid of being suspected of a desire to get professional advice gratis.’

‘That,’ said Thorndyke, ‘is natural enough, and not discreditable. But you must overcome his scruples somehow. I expect you will be able to. You are a plausible young gentleman, as I remember of old, and you seem to have established yourself as quite the friend of the family.’

‘They are rather interesting people,’ I explained; ‘very cultivated and with a strong leaning towards archaeology. It seems to be in the blood.’

‘Yes,’ said Thorndyke; ‘a family tendency, probably due to contact and common surroundings rather than heredity. So you like Godfrey Bellingham?’

‘Yes. He is a trifle peppery and impulsive, but quite an agreeable, genial old butler.’

‘And the daughter,’ said Jervis, ‘what is she like?’

‘Oh, she is a learned lady; works up bibliographies and references at the Museum.’

‘Ah!’ Jervis exclaimed with disfavour, ‘I know the breed. Inky fingers; no chest to speak of; all side and spectacles.’

‘You’re quite wrong,’ I exclaimed indigantly, ‘contrasting Jervis’s hideous presentment with the comely original. ‘She is an exceedingly good-looking girl, and her manners all that a lady’s should be. A little stiff, perhaps, but then I am only an acquaintance—almost a stranger.’

I made a rapid mental inventory, assisted by my recent cogitations.

‘She is about five feet seven, slim but rather plump, very erect in carriage and graceful in movements; black hair, loosely parted in the middle and falling very prettily away from the forehead; pale, clear complexion, dark grey eyes, straight eyebrows, straight, well-shaped nose, short mouth, rather full; round chin—what the deuce are you grinning at, Jervis?’

For my friend had suddenly unmasked his batteries and now threatened, like the Cheshire cat, to dissolve into a mere abstraction of amusement.

‘If there is a copy of that will, Thorndyke,’ he said, ‘we shall get it. I think you agree with me, reverend senior?’

‘I have already said,’ was the reply, ‘that I put my trust in Berkeley. And now let us dismiss professional topics. This is our hostelry.’

He pushed open an unpretentious glazed door, and we followed him into the restaurant, whereof the atmosphere was pervaded by an appetising mealiness mingled with less agreeable suggestions of the destructive distillation of fat.

It was some two hours later when I wished my friends adieu under the golden-leaved plane trees of King’s Bench Walk.

‘I won’t ask you to come in now,’ said Thorndyke, ‘as we have some consultations this afternoon. But come in and see us soon; don’t wait for that copy of the will.’

‘No,’ said Jervis. ‘Drop in in the evening when your work is done; unless, of course, there is more attractive society elsewhere. Oh, you needn’t turn that colour, my dear child; we have all been young once; there is even a tradition that Thorndyke was young some time back in the pre-dynastic period.’

‘Don’t take any notice of him, Berkeley,’ said Thorndyke. ‘The egg-shell is sticking to his head still. He’ll know better when he is my age.’

‘Methuselah!’ exclaimed Jervis; ‘I hope I shan’t have to wait as long as that!’

Thorndyke smiled benevolently at his irrepressible junior, and, shaking my hand cordially, turned into the entry.

From the Temple I wended northward, to the adjacent College of Surgeons, where I spent a couple of profitable hours
examining the ‘pickles’ and refreshing my memory on the subjects of pathology and anatomy; marvelling afresh (as every practical anatomist must marvel) at the incredibly perfect technique of the dissections, and inwardly paying tribute to the founder of the collection. At length the warning of the clock, combined with an increasing craving for tea, drove me forth and bore me towards the scene of my not very strenuous labours. My mind was still occupied with the contents of the cases and the great glass jars, so that I found myself at the corner of Fetter Lane without a very clear idea of how I had got there. But at that point I was aroused from my reflections rather abruptly by a raucous voice in my ear.

‘Orrible discovery at Sidcup!’

I turned wrathfully—for a London street-boy’s yell, let off at point-blank range, is, in effect, like the smack of an open hand—but the inscription on the staring yellow poster that was held up for my inspection changed my anger to curiosity.

‘Horrible discovery in a watercress-bed!’

Now, let prigs deny it if they will, but there is something very attractive in a ‘horrible discovery’. It hints at tragedy, at mystery, at romance. It promises to bring into our grey and commonplace life that element of the dramatic which is the salt that our existence is savoured withal. ‘In a watercress-bed,’ too! The rusticity of the background seemed to emphasise the horror of the discovery, whatever it might be.

I bought a copy of the paper, and, tucking it under my arm, hurried on to the surgery, promising myself a mental feast of watercress; but as I opened the door I found myself confronted by a corpulent woman of piebald and pimply aspect who saluted me with a deep groan. It was the lady from the coal shop in Fleur-de-Lys Court.

‘Good-evening, Mrs. Jablett,’ I said briskly; ‘not come about yourself, I hope.’

‘Yes, I have,’ she answered, rising and following me gloomily into the consulting-room; and then, when I had seated her in the patient’s chair and myself at the writing table, she continued: ‘It’s my inside, you know, doctor.’

The statement lacked anatomical precision and merely excluded the domain of the skin specialist. I accordingly waited for enlightenment and speculated on the watercress-beds, while Mrs. Jablett regarded me expectantly with a dim and watery eye.

‘Ah!’ I said at length; ‘it’s your—your inside, is it, Mrs. Jablett?’

‘Yus. And my ‘ead,’ she added, with a voluminous sigh that filled the apartment with odorous reminiscences of ‘unsweetened’.

‘Your head aches, does it?’

‘Something chronic!’ said Mrs. Jablett. ‘Feels as if it was a-opening and a-shutting, a-opening and a-shutting, and when I sit down I feel as if I should bust.’

This picturesque description of her sensations—not wholly inconsistent with her figure—gave the clue to Mrs. Jablett’s sufferings. Resisting a frivolous impulse to reassure her as to the elasticity of the human integument, I considered her case in exhaustive detail, coasting delicately round the subject of ‘unsweetened’ and finally sent her away, revived in spirits and grasping a bottle of Mist. Sodaex cum Bismutho from Barnard’s big stock-jar. Then I went back to investigate the Horrible Discovery; but before I could open the paper, another patient arrived (Impetigo contagiosa, this time, affecting the ‘wide and arched-front sublime’ of a juvenile Fetter Laner), and then yet another, and so on through the evening, until at last I forgot the watercress-beds altogether. It was only when I had purified myself from the evening consultations with hot water and a nail-brush and was about to sit down to a frugal supper, that I remembered the newspaper and fetched it from the drawer of the consulting-room table, where it had been hastily thrust out of sight. I folded it into a convenient form, and, standing it upright against the water-jug, read the report at my ease as I supped.

There was plenty of it. Evidently the reporter had regarded it as a ‘scoop’, and the editor had backed him up with ample space and hair-raising head-lines.

‘HORRIBLE DISCOVERY

IN A WATERCRESS-BED

AT SIDCUP!’

‘A startling discovery was made yesterday afternoon in the course of clearing out a watercress-bed near the erstwhile rural village of Sidcup in Kent; a discovery that will occasion many a disagreeable qualm to those persons who have been in the habit of regaling themselves with this refreshing esculent. But before proceeding to a description of the circumstances of the actual discovery or of the objects found—which, however, it may be stated at once, are nothing more or less than the fragments of a dismembered human body—it will be interesting to trace the remarkable chain of coincidences by virtue of which the discovery was made.

The beds in question have been laid out in a small artificial lake fed by a tiny streamlet which forms one of the numerous tributaries of the River Cray. Its depth is greater than usual in the watercress-beds, otherwise the gruesome relics could never have been concealed beneath its surface, and the flow of water through it, though continuous, is slow. The tributary streamlet meanders through a succession of pasture meadows, in one of which the beds themselves are situated, and here throughout most of the year the fleecy victims of the human carnivore carry on the industry of converting grass into mutton. Now it happened some years ago that the sheep frequenting these pastures became affected with the disease
known as “liver-rot”; and here we must make a short digression into the domain of pathology.

“Liver-rot” is a disease of quite romantic antecedents. Its cause is a small flat worm—the liver-fluke—which infests the liver and bile-ducts of the affected sheep.

'Now how does the worm get into the sheep’s liver? That is where the romance comes in. Let us see.

'The cycle of transformations begins with the deposit of the eggs of the fluke in some shallow stream or ditch running pasturage lands. Now each egg has a sort of lid, which presently opens and lets out a minute, hairy creature who swims away in search of a particular kind of water-snail—the kind called by naturalists Lymnaea truncatula. If he finds a snail, he bores his way into its flesh and soon begins to grow and wax fat. Then he brings forth a family—of tiny worms quite unlike himself, little creatures called rediae, which soon give birth to families of young rediae. So they go on for several generations, but at last there comes a generation of redia which, instead of giving birth to fresh redia, produce families of totally different offspring; big-headed, long-tailed creatures like miniature tadpoles, called by the learned cercaric. The cercaric soon wriggle their way out of the body of the snail, and then complications arise: for it is the habit of this particular snail to leave the water occasionally and take a stroll in the fields. Thus the cercaric, escaping from the snail, find themselves on the grass, whereupon they promptly drop their tails and stick themselves to the grass-blades. Then comes the unsuspecting sheep to take his frugal meal, and, cropping the grass, swallows it, cercaric and all. But the latter, when they find themselves in the sheep’s stomach, make their way straight to the bile-ducts, up which they travel to the liver. Here, in a few weeks, they grow up into full-blown flukes and begin the important business of producing eggs.

'Such is the pathological romance of the “liver-rot”; and now what is its connection with this mysterious discovery? It is this. After the outbreak of “liver-rot” above referred to, the ground landlord, a Mr. John Bellingham, instructed his solicitor to insert a clause in the lease of the beds directing that the latter should be periodically cleared and examined by an expert to make sure that they were free from the noxious water-snails. The last lease expired about two years ago, and since then the beds have been out of cultivation; but, for the safety of the adjacent pastures, it was considered necessary to make the customary periodical inspection, and it was in the course of cleaning the beds for this purpose that the present discovery was made.

'The operation began two days ago. A gang of three men proceeded systematically to grub up the plants and collect the multitudes of water-snails that they might be examined by the expert to see if any obnoxious species were present. They had cleared nearly half of the beds when, yesterday afternoon, one of the men working in the deepest part came upon some bones, the appearance of which excited his suspicion. Thereupon he called his mates, and they carefully picked away the plants piece-meal, a process that soon laid bare an unmistakable human hand lying on the mud amongst the roots. Fortunately they had the wisdom not to disturb the remains, but at once sent off a message to the police. Very soon, an inspector and a sergeant, accompanied by the divisional surgeon, arrived on the scene, and were able to view the remains lying as they had been found. And now another very strange fact came to light; for it was seen that the hand—a left one—lying on the mud was minus its third finger. This is regarded by the police as a very important fact as bearing on the question of identification, seeing that the number of persons having the third finger of the left hand missing must be quite small. After a thorough examination on the spot, the bones were carefully collected and conveyed to the mortuary, where they now lie awaiting further inquiries.

'The divisional surgeon, Dr. Brandon, in an interview with our representative, made the following statements:

“The bones are those of the left arm of a middle-aged or elderly man about five feet eight inches in height. All the bones of the arm are present, including the scapula, or shoulder-blade, and the clavicle, or collar-bone, but the three bones of the third finger are missing.”

“Is this a deformity or has the finger been cut off?” our correspondent asked.

“The finger has been amputated,” was the reply. “If it had been absent from birth, the corresponding hand bone, or metacarpal, would have been wanting or deformed, whereas it is present and quite normal.”

“How long have the bones been in the water?” was the next question.

“More than a year, I should say. They are quite clean; there is not a vestige of the soft structures left.”

“Have you any theory as to how the arm came to be deposited where it was found?”

“I should rather not answer that question,” was the guarded response.

“One more question,” our correspondent urged. “The ground landlord, Mr. John Bellingham; is he not the gentleman who disappeared so mysteriously some time ago?”

“So I understand,” Dr. Brandon replied.

“Can you tell me if Mr. Bellingham had lost the third finger of his left hand?”

“I cannot say,” said Dr. Brandon; and he added with a smile, “you had better ask the police.”

‘That is how the matter stands at present. But we understand that the police are making active inquiries for any missing man who has lost the third finger of his left hand, and if any of our readers know of such a person, they are earnestly requested to communicate at once, either with us or with the authorities.

‘Also we believe that a systematic search is to be made for further remains.’
I lay the newspaper down and fell into a train of reflection. It was certainly a most mysterious affair. The thought that had evidently come to the reporter’s mind stole naturally into mine. Could these remains be those of John Bellingham? It was obviously possible, though I could not but see that the fact of the bones having been found on his land, while it undoubtedly furnished the suggestion, did not in any way add to its probability. The connection was accidental and in nowise relevant.

Then, too, there was the missing finger. No reference to any such deformity had been made in the original report of the disappearance, though it could hardly have been overlooked. I should be seeing Thorndyke in the course of the next few days, and, undoubtedly, if the discovery had any bearing upon the disappearance of John Bellingham, I should hear of it. With such a reflection I rose from the table, and, adopting the advice contained in the spurious Johnsonian quotation, proceeded to ‘take a walk in Fleet Street’ before settling down for the evening.

VI. — SIDELIGHTS

THE association of coal with potatoes is one upon which I have frequently speculated, without arriving at any more satisfactory explanation than that both products are of the earth, earthy. Of the connection itself Barnard’s practice furnished several instances besides Mrs. Jablett’s establishment in Fleur-de-Lys Court, one of which was a dark and mysterious cavern a foot below the level of the street, that burrowed under an ancient house on the west side of Fetter Lane—a crinkly, timber house of the three-decker type that leaned back drunkenly from the road as if about to sit down in its own back yard.

Passing this repository of the associated products about ten o’clock in the morning, I perceived in the shadows of the cavern no less a person than Miss Oman. She saw me at the same moment, and beckoned peremptorily with a hand that held a large Spanish onion. I approached with a deferential smile.

‘What a magnificent onion, Miss Oman! and how generous of you to offer it to me—’

‘I wasn’t offering it to you. But there! Isn’t it just like a man—’

‘Isn’t what just like a man?’ I interrupted. ‘If you mean the onion—’

‘I don’t!’ she snapped; ‘and I wish you wouldn’t talk such a parcel of nonsense. A grown man and a member of a serious profession, too! You ought to know better.’

‘I suppose I ought,’ I said reflectively. And she continued:

‘I called in at the surgery just now.’—

‘To see me?’—

‘What else should I come for? Do you suppose that I called to consult the bottle-boy?’

‘Certainly not, Miss Oman. So you find the lady doctor no use, after all?’

Miss Oman gnashed her teeth at me (and very fine teeth they were too).

‘I called,’ she said majestically, ‘on behalf of Miss Bellingham.’

My facetiousness evaporated instantly. ‘I hope Miss Bellingham is not ill,’ I said with a sudden anxiety that elicited a sardonic smile from Miss Oman.

‘No,’ was the reply, ‘she is not ill, but she has cut her hand rather badly. It’s her right hand too, and she can’t afford to lose the use of it, not being a great, hulky, lazy, lolloping man. So you had better go and put some stuff on it.’

With this advice, Miss Oman whisked to the right-about and vanished into the depths of the cavern like the witch of Wokey, while I hurried on to the surgery to provide myself with the necessary instruments and materials, and thence proceeded to Nevill’s Court.

Miss Oman’s juvenile maidservant, who opened the door to me, stated the existing conditions with epigrammatic conciseness.

‘Mr. Bellingham is out, sir; but Miss Bellingham is in.’

Having thus delivered herself she retreated towards the kitchen and I ascended the stairs, at the head of which I found Miss Bellingham awaiting me with her right hand encased in what looked like a white boxing-glove.

‘I’m glad you have come,’ she said. ‘Phyllis—Miss Oman, you know—has kindly bound up my hand, but I should like you to see that it is all right.’

We went into the sitting-room, where I laid out my paraphernalia on the table while I inquired into the particulars of the accident.

‘It is most unfortunate that it should have happened just now,’ she said, as I wrestled with one of those remarkable feminine knots that, while they seem to defy the utmost efforts of human ingenuity to untie, yet have a singular habit of untying themselves at inopportune moments.
'Why just now in particular?' I asked.

'Because I have some specially important work to do. A very learned lady who is writing an historical book has commissioned me to collect all the literature relating to the Tell el Amarna letters—the cuneiform tablets, you know, of Amenhotep the Fourth.'

'Well,' I said soothingly, 'I expect your hand will soon be well.'

'Yes, but that won’t do. The work has to be done immediately. I have to send in completed notes not later than this day week, and it will be quite impossible. I am dreadfully disappointed.'

By this time I had unwound the voluminous wrappings and exposed the injury—a deep gash in the palm that must have narrowly missed a good-sized artery. Obviously the hand would be useless for fully a week.

'I suppose,' she said, 'you couldn’t patch it up so that I could write with it?'

I shook my head.

'No, Miss Bellingham. I shall have to put it on a splint. We can’t run any risks with a deep wound like this.'

I proceeded methodically with the application of the dressings, and meanwhile reflected. It was evident that she was deeply disappointed. Loss of work meant loss of money, and it needed but a glance at her dusty black dress to see that there was little margin for that. Possibly, too, there was some special need to be met. Her manner seemed almost to imply that there was. And at this point I had a brilliant idea.

'I'm not sure that it can’t be helped,' said I.

She looked at me inquiringly, and I continued: 'I am going to make a proposition, and I shall ask you to consider it with an open mind.'

'That sounds rather portentous,' said she; 'but I promise. What is it?'

'It is this: When I was a student I acquired the useful art of writing shorthand. I am not a lightning reporter, you understand, but I can take matter down from dictation at quite respectable speed.'

'Yes.'

'Well, I have several hours free every day—usually the whole afternoon up to six or half-past—and it occurs to me that if you were to go to the Museum in the mornings you could get out your book, look up passages (you could do that without using your right hand), and put in bookmarks. Then I could come along in the afternoon and you could read out the selected passages to me, and I could take them down in shorthand. We should get through as much in a couple of hours as you could in a day using long-hand.'

'Oh, but how kind of you, Dr. Berkeley!' she exclaimed. 'How very kind! Of course, I couldn’t think of taking up all your leisure in that way; but I do appreciate your kindness very much.'

I was rather chaffallen at this very definite refusal, but persisted feebly:

'I wish you would. It may seem rather a cheek for a comparative stranger like me to make such a proposal to a lady: but if you’d been a man—in those special circumstances—I should have made it all the same, and you would have accepted as a matter of course.'

'I doubt that. At any rate, I am not a man. I sometimes wish I were.'

'Oh, I am sure you are much better as you are!' I exclaimed, with such earnestness that we both laughed. And at this moment Mr. Bellingham entered the room carrying several large brand-new books in a strap.

'Well, I’m sure!' he exclaimed genially; 'here are pretty goings on. Doctor and patient giggling like a pair of schoolgirls! What’s the joke?'

He thumped his parcel of books down on the table and listened smilingly while my unconscious witticism was expounded.

'The doctor’s quite right,' he said. 'You’ll do as you are, chick; but the Lord knows what sort of man you would make. You take his advice and let well alone.'

Finding him in this genial frame of mind, I ventured to explain my proposition to him and to enlist his support. He considered it with attentive approval, and when I had finished turned to his daughter.

'What is your objection, chick?' he asked.

'It would give Doctor Berkeley such a fearful lot of work,' she answered.

'It would give him a fearful lot of pleasure,' I said. 'It would really.'

'Then why not?' said Mr. Bellingham. 'We don’t mind being under an obligation to the Doctor, do we?'
‘Oh, it isn’t that!’ she exclaimed hastily.

‘Then take him at his word. He means it. It is a kind action and he’ll like doing it, I’m sure. That’s all right, Doctor; she accepts, don’t you, chick?’

‘Yes, if you say so, I do; and most thankfully.’

She accompanied the acceptance with a gracious smile that was in itself a large repayment on account, and when we had made the necessary arrangements, I hurried away in a state of the most perfect satisfaction to finish my morning’s work and order an early lunch.

When I called for her a couple of hours later I found her waiting in the garden with the shabby handbag, of which I relieved her, and we set forth together, watched jealously by Miss Oman, who had accompanied her to the gate.

As I walked up the court with this wonderful maid by my side I could hardly believe in my good fortune. By her presence and my own resulting happiness the mean surroundings became glorified and the commonest objects transfigured into things of beauty. What a delightful thoroughfare, for instance, was Fetter Lane, with its quaint charm and mediaeval grace! I snuffed the cabbage-laden atmosphere and seemed to breathe the scent of the asphodel. Holborn was even as the Elysian Fields; the omnibus that bore us westward was a chariot of glory; and the people who swarmed verminously on the pavements bore the semblance of the children of light.

Love is a foolish thing judged by workaday standards, and the thoughts and actions of lovers foolish beyond measure. But the workaday standard is the wrong one, after all; for the utilitarian mind does but busy itself with the trivial and transitory interests of life, behind which looms the great and everlasting reality of the love of man and woman. There is more significance in a nightingale’s song in the hush of a summer night than in all the wisdom of Solomon (who, by the way, was not without his little experiences of the tender passion).

The janitor in the little glass box by the entrance to the library inspected us and passed us on, with a silent benediction, to the lobby, whence (when I had handed my stick to a bald-headed demigod and received a talismanic disc in exchange) we entered the enormous rotunda of the reading-room.

I have often thought that, if some lethal vapour of highly preservative properties—such as formaldehyde, for instance—could be shed into the atmosphere of this apartment, the entire and complete collection of books and book-worms would be well worth preserving, for the enlightenment of posterity, as a sort of anthropological appendix to the main collection of the Museum. For, surely, nowhere else in the world are so many strange and abnormal human beings gathered together in one place. And a curious question that must have occurred to many observers is: Whence do these singular creatures come, and whither do they go when the very distinct-faced clock (adjusted to literary eyesight) proclaims closing time? The tragic-faced gentleman, for instance, with the corkscrew ringlets that bob up and down like spiral springs as he walks? Or the short, elderly gentleman in the black cassock and bowler hat, who shatters your nerves by turning suddenly and revealing himself as a middle-aged woman? Whither do they go? One never sees them elsewhere. Do they steal away at closing time into the depths of the Museum and hide themselves until morning in sarcophagi or mummy cases? Or do they creep through spaces in the book-shelves and spend the night behind the volumes in a congenial atmosphere of leather and antique paper? Who can say? What I do know is that when Ruth Bellingham entered the reading-room she appeared in comparison with these like a creature of another order; even as the head of Antinous, which formerly stood (it has since been moved) amidst the portrait-busts of the Roman Emperors, seemed like the head of a god set in a portrait gallery of illustrious baboons.

‘What have we got to do?’ I asked when we had found a vacant seat. ‘Do you want to look up the catalogue?’

‘No, I have the tickets in my bag. The books are waiting in the “kept books” department.’

I placed my hat on the leather-covered shelf, dropped her gloves into it—how delightfully intimate and companionable it seemed!—altered the numbers on the tickets, and then we proceeded together to the ‘kept books’ desk to collect the volumes that contained the material for our day’s work.

It was a blissful afternoon. Two and a half hours of happiness unalloyed did I spend at that shiny, leather-clad desk, guiding my nimble pen across the pages of the notebook. It introduced me to a new world—a world in which love and learning, sweet intimacy and trusted archaeology, were mingled into the oddest, most whimsical and most delicious confection that the mind of man can conceive. Hitherto, these recondite histories had been far beyond my ken. Of the wonderful heretic, Amenhotep the Fourth, I had already heard—at the most he had been a mere name; the Hittites a mythical race of undetermined habitat; while cuneiform tablets had presented themselves to my mind merely as an uncouth kind of fossil biscuit suited to the digestion of a prehistoric ostrich.

Now all this was changed. As we sat with our chairs creaking together and she whispered the story of those stirring times into my receptive ear—talking is strictly forbidden in the reading-room—the disjointed fragments arranged themselves into a romance of supreme fascination. Egyptian, Babylonian, Aramaean, Hittite, Memphis, Babylon, Hamath, Megiddo—I swallowed them all thankfully, wrote them down, and asked for more. Only once did I disgrace myself. An elderly clergyman of ascetic and acidulous aspect had passed us with a glance of evident disapproval, clearly setting us down as intruding philanderers; and when I contrasted the parson’s probable conception of the whispered communications that were being poured into my ear so tenderly and confidentially with the dry reality, I chuckled aloud. But my fair taskmistress only paused, with her finger on the page, smilingly to rebuke me, and then went on with the dictation. She
was certainly a Tartar for work.

It was a proud moment for me when, in response to my interrogative 'Yes?' my companion said 'That is all' and closed the book. We had extracted the pith and marrow of six considerable volumes in two and a half hours.

'You have been better than your word,' she said. 'It would have taken me two full days of really hard work to make the notes that you have written down since we commenced. I don't know how to thank you.'

'There's no need to. I've enjoyed myself and polished up my shorthand. What is the next thing? We shall want some books for to-morrow, shan't we?'

'Yes. I have made out a list, so if you will come with me to the catalogue desk I will look out the numbers and ask you to write the tickets.'

The selection of a fresh batch of authorities occupied us for another quarter of an hour, and then, having handed in the volumes that we had squeezed dry, we took our way out of the reading-room.

'Which way shall we go?' she asked as we passed out of the gate, where stood a massive policeman, like the guardian angel at the gate of Paradise (only, thank Heaven! he bore no flaming sword forbidding re-entry).

'We are going,' I replied, 'to Museum Street, where is a milkshop in which one can get an excellent cup of tea.'

She looked as if she would have demurred, but eventually followed obediently, and we were soon settled side by side at the little marble-topped table, retracing the ground we had covered in the afternoon's work and discussing various points of interest over a joint teapot.

'Have you been doing this sort of work long?' I asked, as she handed me my second cup of tea.

'Professionally,' she answered, 'only about two years; since we broke up our home, in fact. But long before that I used to come to the Museum with my Uncle John—the one who disappeared, you know, in that dreadfully mysterious way—and help him to look up references. We were good friends, he and I.'

'I suppose he was a very learned man?' I suggested.

'Yes, in a certain way; in the way of the better-class collector he was very learned indeed. He knew the contents of every museum in the world, in so far as they were connected with Egyptian antiquities, and had studied them specimen by specimen. Consequently, as Egyptology is largely a museum science, he was a learned Egyptologist. But his real interest was in things rather than events. Of course, he knew a great deal—a very great deal—about Egyptian history, but still he was, before all, a collector.'

'And what will happen to his collection if he is really dead?'

'The greater part of it goes to the British Museum by his will, and the remainder he has left to his solicitor, Mr. Jellicoe.'

'To Mr. Jellicoe! Why, what will Mr. Jellicoe do with Egyptian antiquities?'

'Oh, he is an Egyptologist too, and quite an enthusiast. He has really a fine collection of scarabs and other small objects such as it is possible to keep in a private house. I have always thought that it was his enthusiasm for everything Egyptian that brought him and my uncle together on terms of such intimacy; though I believe he is an excellent lawyer, and he is certainly a very discreet, cautious man.'

'Is he? I shouldn't have thought so, judging by your uncle's will.'

'Oh, but that was not Mr. Jellicoe's fault. He assures us that he entreated my uncle to let him draw up a fresh document with more reasonable provisions. But he says Uncle John was immovable; and he really was a rather obstinate man. Mr. Jellicoe repudiates any responsibility in the matter. He washes his hands of the whole affair, and says that it is the will of a lunatic. And so it is. I was glancing through it only a night or two ago, and really I cannot conceive how a sane man could have written such nonsense.'

'You have a copy then?' I asked eagerly, remembering Thorndyke's parting instructions.

'Yes. Would you like to see it? I know my father has told you about it, and it is worth reading as a curiosity of perverseness.'

'I should very much like to show it to my friend, Doctor Thorndyke,' I replied. 'He said he would be interested to read it and learn the exact provisions; and it might be well to let him, and hear what he has to say about it.'

'I see no objection,' she rejoined; 'but you know what my father is: his horror, I mean, of what he calls "cadging for advice gratis".'

'Oh, but he need have no scruples on that score. Doctor Thorndyke wants to see the will because the case interests him. He is an enthusiast, you know, and he put the request as a personal favour to himself.'

'That is very nice and delicate of him, and I will explain the position to my father. If he is willing for Doctor Thorndyke to see the copy, I will send or bring it over this evening. Have we finished?'

I regretfully admitted that we had, and, when I had paid the modest reckoning, we sallied forth, turning back with one accord into Great Russell Street to avoid the noise and bustle of the larger thoroughfares.
‘What sort of man was your uncle?’ I asked presently, as we walked along the quiet, dignified street. And then I added hastily: ‘I hope you don’t think me inquisitive, but, to my mind, he presents himself as a kind of mysterious abstraction; the unknown quantity of a legal problem.’

‘My Uncle John,’ she answered reflectively, ‘was a very peculiar man, rather obstinate, very self-willed, what people call “masterful”, and decidedly wrong-headed and unreasonable.’

‘That is certainly the impression that the terms of his will convey,’ I said.

‘Yes, and not the will only. There was the absurd allowance that he made to my father. That was a ridiculous arrangement, and very unfair too. He ought to have divided the property up as my grandfather intended. And yet he was by no means ungenerous, only he would have his own way, and his own way was very commonly the wrong way.’

‘I remember,’ she continued, after a short pause, ‘a very odd instance of his wrong-headedness and obstinacy. It was a small matter, but very typical of him. He had in his collection a beautiful little ring of the eighteenth dynasty. It was said to have belonged to Queen Ti, the mother of our friend Amenhotep the Fourth; but I don’t think that could have been so, because the device on it was the Eye of Osiris, and Ti, as you know, was an Aten-worshipper. However, it was a very charming ring, and Uncle John, who had a queer sort of devotion to the mystical eye of Osiris, commissioned a very clever goldsmith to make two exact copies of it, one for himself and one for me. The goldsmith naturally wanted to take the measurements of our fingers, but this Uncle John would not hear of; the rings were to be exact copies, and an exact copy must be the same size as the original. You can imagine the result; my ring was so loose that I couldn’t keep it on my finger, and Uncle John’s was so tight that though he did manage to get it on, he was never able to get it off. And it was only the circumstance that his left hand was decidedly smaller than his right that made it possible for him to wear it at all.’

‘So you never wore your copy?’

‘No. I wanted to have it altered to make it fit, but he objected strongly; so I put it away, and have it in a box still.’

‘He must have been an extraordinarily pig-headed old fellow,’ I remarked.

‘Yes; he was very tenacious. He annoyed my father a good deal, too, by making unnecessary alterations in the house in Queen Square when he fitted up his museum. We have a certain sentiment with regard to that house. Our people have lived in it ever since it was built, when the square was first laid out in the reign of Queen Anne, after whom it was named. It is a dear old house. Would you like to see it? We are quite near it now.’

I assented eagerly. If it had been a coal-shed or a fried-fish shop I would still have visited it with pleasure, for the sake of prolonging our walk; but I was also really interested in this old house as a part of the background of the mystery of the vanished John Bellingham.

We crossed into Cosmo Place, with its quaint row of the now rare, cannon-shaped iron posts, and passing through stood for a few moments looking into the peaceful, stately old square. A party of boys dispersed themselves noisily on the range of stone posts that form a bodyguard round the ancient lamp-surmounted pump, but otherwise the place was wrapped in dignified repose suited to its age and station. And very pleasant it looked on this summer afternoon with the sunlight gilding the foliage of its widespread plane trees and lighting up the warm-toned brick of the house-fronts. We walked slowly down the shady west side, near the middle of which my companion halted.

‘This is the house,’ she said. ‘It looks gloomy and forsaken now; but it must have been a delightful house in the days when my ancestors could look out of the windows through the open end of the square across the fields of meadows to the heights of Hampstead and Highgate.’

She stood at the edge of the pavement looking up with a curious wistfulness at the old house; a very pathetic figure, I thought, with her handsome face and proud carriage, her threadbare dress and shabby gloves, standing at the threshold of the home that had been her family’s for generations, that should now have been hers, and that was shortly to pass away into the hands of strangers.

I, too, looked up at it with a strange interest, impressed by something gloomy and forbidding in its aspect. The windows were shuttered from basement to attic, and no sign of life was visible. Silent, neglected, desolate, it breathed an air of tragedy. It seemed to mourn in sackcloth and ashes for its lost master. The massive door within the splendid carven portico was crusted with grime, and seemed to have passed out of use as completely as the ancient lamp-irons or the rusted extinguishers wherein the footmen were wont to quench their torches when some Bellingham dame was borne up the steps in her gilded chair, in the days of good Queen Anne.

It was in a somewhat sobered frame of mind that we presently turned away and started homeward by way of Great Ormond Street. My companion was deeply thoughtful, relapsing for a while into that sombreness of manner that had so impressed me when I first met her. Nor was I without a certain sympathetic pensiveness; as if, from the great, silent house, the spirit of the vanished man had issued forth to bear us company.

But still it was a delightful walk, and I was sorry when at last we arrived at the entrance to Nevill’s Court, and Miss Bellingham halted and held out her hand.

‘Good-bye,’ she said; ‘and many, many thanks for your invaluable help. Shall I take the bag?’

‘If you want it. But I must take out the note-books.’
VII. — JOHN BELLINGHAM’S WILL

THE task upon which I had embarked so light-heartedly, when considered in cold blood, did certainly appear, as Miss Bellingham had said, rather appalling. The result of two and a half hours’ pretty steady work at an average speed of nearly an hundred words a minute, would take some time to transcribe into long-hand; and if the notes were to be delivered punctually on the morrow, the sooner I got to work the better.

Recognising this truth, I lost no time, but, within five minutes of my arrival at the surgery, was seated at the writing-table with my copy before mebusily converting the sprawling, inexpressive characters into good, legible round-hand.

The occupation was by no means unpleasant, apart from the fact that it was a labour of love; for the sentences, as I picked them up, were fragrant with the reminiscences of the gracious whisper in which they had first come to me. And then the matter itself was full of interest. I was gaining a fresh outlook on life, was crossing the threshold of a new world (which was her world); and so the occasional interruptions from the patients, while they gave me intervals of enforced rest, were far from welcome.

The evening wore on without any sign from Nevill’s Court, and I began to fear that Mr. Bellingham’s scruples had proved insurmountable. Not, I am afraid, that I was so much concerned for the copy of the will as for the possibility of a visit, no matter howsoever brief, from my fair employer; and when, on the stroke of half-past seven, the surgery door fell open with startling abruptness, my fears were allayed and my hopes shattered simultaneously. For it was Miss Oman who stalked in, holding out a blue foolscap envelope with a warlike air as if it were an ultimatum.

‘I’ve brought you this from Mr. Bellingham,’ she said. ‘There’s a note inside.’

‘May I read the note, Miss Oman?’ I asked.

‘Bless the man!’ she exclaimed. ‘What else would you do with it? Isn’t that what it’s brought for?’

I supposed it was; and, thanking her for her gracious permission, I glanced through the note—a few lines authorising me to show the copy of the will to Dr. Thorndyke. When I looked up from the paper I found her eyes fixed on me with an expression critical and rather disapproving.

‘You seem to be making yourself mighty agreeable in a certain quarter,’ she remarked.

‘I make myself universally agreeable. It is my nature to.’

‘Ha!’ she snorted.

‘Don’t you find me rather agreeable?’ I asked.

‘Oily,’ said Miss Oman. And then with a sour smile at the open notebooks, she remarked:

‘You’ve got some work to do now; quite a change for you.’

‘A delightful change, Miss Oman. “For Satan findeth”—but no doubt you are acquainted with the philosophical works of Dr. Watts?’

‘If you are referring to “idle hands”,’ she replied, ‘I’ll give you a bit of advice. Don’t you keep that hand idle any longer than is really necessary. I have my suspicions about that splint—oh, you know what I mean,’ and before I had time to reply, she had taken advantage of the entrance of a couple of patients to whisk out of the surgery with the abruptness that had distinguished her arrival.

The evening consultations were considered to be over by half-past eight; at which time Adolphus was wont with exemplary punctuality to close the outer door of the surgery. To-night he was not less prompt than usual; and having performed this, his last daily office, and turned down the surgery gas, he reported the fact and took his departure.
As his retreating footsteps died away and the slamming of the outer door announced his final disappearance, I sat up and stretched myself. The envelope containing the copy of the will lay on the table, and I considered it thoughtfully. It ought to be conveyed to Thorndyke with as little delay as possible, and, as it certainly could not be trusted out of my hands, it ought to be conveyed by me.

I looked at the notebooks. Nearly two hours’ work had made a considerable impression on the matter that I had to transcribe, but still, a great deal of the task yet remained to be done. However, I reflected, I could put in a couple of hours or more before going to bed and there would be an hour or two to spare in the morning. Finally I locked the notebooks, open as they were, in the writing-table drawer, and slipping the envelope into my pocket, set out for the Temple.

The soft chime of the Treasury clock was telling out, in confidential tones, the third quarter as I rapped with my stick on the forbidding ‘oak’ of my friends’ chambers. There was no response, nor had I perceived any gleam of light from the windows as I approached, and I was considering the advisability of trying the laboratory on the next floor, when footsteps on the stone stairs and familiar voices gladdened my ear.

‘Hallo, Berkeley!’ said Thorndyke, ‘do we find you waiting like a Peri at the gates of Paradise? Polton is upstairs, you know, tinkering at one of his inventions. If you ever find the nest empty, you had better go up and bang at the laboratory door. He’s always there in the evenings.’

‘I haven’t been waiting long,’ said I, ‘and I was just thinking of rousing him up when you came.’

‘That was right,’ said Thorndyke, turning up the gas. ‘And what news do you bring? Do I see a blue envelope sticking out of your pocket?’

‘You do.’

‘Is it a copy of the will?’ he asked.

I answered ‘yes’, and added that I had full permission to show it to him.

‘What did I tell you?’ exclaimed Jervis. ‘Didn’t I say that he would get the copy for us if it existed?’

‘We admit the excellence of your prognosis,’ said Thorndyke, ‘but there is no need to be boastful. Have you read through the document, Berkeley?’

‘No, I haven’t taken it out of the envelope.’

‘Then it will be equally new to us all, and we shall see if it tallies with your description.’

He placed three easy chairs at a convenient distance from the light, and Jervis, watching him with a smile, remarked:

‘Now Thorndyke is going to enjoy himself. To him, a perfectly unintelligible will is a thing of beauty and a joy for ever; especially if associated with some kind of recondite knavery.’

‘I don’t know,’ said I, ‘that this will is particularly unintelligible. The mischief seems to be that it is rather too intelligible. However, here it is,’ and I handed it over to Thorndyke.

‘I suppose that we can depend on this copy,’ said the latter, as he drew out the document and glanced at it. ‘Oh, yes,’ he added, ‘I see it is copied by Godfrey Bellingham, compared with the original and certified correct. In that case I will get you to read it out slowly, Jervis, and I will make a rough copy for reference. Let us make ourselves comfortable and light our pipes before we begin.’

He provided himself with a writing-pad, and, when we had seated ourselves and got our pipes well alight, Jervis opened the document, and with a premonitory ‘hem!’ commenced the reading.

‘In the name of God, Amen. This is the last will and testament of me John Bellingham of number 141 Queen Square in the parish of St George Bloomsbury London in the county of Middlesex Gentleman made this twenty-first day of September in the year of our Lord one thousand eight hundred and ninety-two.

‘I. I give and bequeath unto Arthur Jellicoe of number 184 New Square Lincoln’s Inn London in the county of Middlesex Attorney-at-law the whole of my collection of seals and scarabs and those in my cabinets marked A, B, and D together with the contents thereof and the sum of two thousand pounds sterling free of legacy duty.

‘Unto the trustees of the British Museum the residue of my collection of antiquities.

‘Unto my cousin George Hurst of The Poplars Eltham in the county of Kent the sum of five thousand pounds free of legacy duty and unto my brother Godfrey Bellingham or if he should die before the occurrence of my death unto his daughter Ruth Bellingham the residue of my estate and effects real and personal subject to the conditions set forth hereinafter namely:

‘2. That my body shall be deposited with those of my ancestors in the churchyard appertaining to the church and parish of St George the Martyr or if that shall not be possible in some other churchyard cemetery burial ground church or chapel or other authorised place for the reception of bodies of the dead situate within or appertaining to the parishes of St Andrew above the Bars and St George the Martyr or St George Bloomsbury and St Giles in the Fields. But if the condition in this clause be not carried out then

‘3. I give and devise the said residue of my estate and effects unto my cousin George Hurst aforesaid and I hereby revoke
all wills and codicils made by me at any time heretofore and I appoint Arthur Jellicoe aforesaid to be the executor of this my will jointly with the principal beneficiary and residuary legatee that is to say with the aforesaid Godfrey Bellingham if the conditions set forth hereinafore in clause 2 shall be duly carried out but with the aforesaid George Hurst if the said conditions in the said clause 2 be not carried out.

‘John Bellingham

'Signed by the said testator John Bellingham in the presence of us present at the same time who at his request and in his presence and in the presence of each other have subscribed our names as witnesses.

‘Frederick Wilton, 16 Medford Road, London, N, clerk.

‘James Barber, 32 Wadbury Crescent, London, SW, clerk.’

‘Well,’ said Jervis, laying down the document as Thorndyke detached the last sheet from his writing-pad, ‘I have met with a good many idiotic wills, but this one can give them all points. I don’t see how it is ever going to be administered. One of the two executors is a mere abstraction—a sort of algebraical problem with no answer.’

‘I think that difficulty could be overcome,’ said Thorndyke.

‘I don’t see how,’ retorted Jervis. ‘If the body is deposited in a certain place, A is the executor; if it is somewhere else, B is the executor. But as you cannot produce the body, and no one has the least idea where it is, it is impossible to prove either that it is or that it is not in any specified place.’

‘You are magnifying the difficulty, Jervis,’ said Thorndyke. ‘The body may, of course, be anywhere in the entire world, but the place where it is lying is either inside or out the general boundary of those two parishes. If it has been deposited within the boundary of those two parishes, the fact must be ascertainable by examining the burial certificates issued since the date when the missing man was last seen alive and by consulting the registers of those specified places of burial. I think that if no record can be found of any such interment within the boundary of those two parishes, that fact will be taken by the Court as proof that no such interment has taken place, and that therefore the body must have been deposited somewhere else. Such a decision would constitute George Hurst the co-executor and residuary legatee.’

‘That is cheerful for your friends, Berkeley,’ Jervis remarked, ‘for we may take it as pretty certain that the body has not been deposited in any of the places named.’

‘Yes,’ I agreed gloomily, ‘I’m afraid there is very little doubt of that. But what an ass the fellow must have been to make such a to-do about his beastly carcass! What the deuce could it have mattered to him where it was dumped, when he had done with it?’

Thorndyke chuckled softly. ‘Thus the irreverent youth of to-day,’ said he. ‘But yours is hardly a fair comment, Berkeley. Our training makes us materialists, and puts us a little out of sympathy with those in whom primitive beliefs and emotions survive. A worthy priest who came to look at our dissecting-room expressed surprise to me that the students, thus constantly in the presence of relics of mortality, should be able to think of anything but the resurrection and the life hereafter. He was a bad psychologist. There is nothing so dead as a dissecting-room “subject”; and the contemplation of the human body in the process of being quietly taken to pieces—being resolved into its structural units like a worn-out clock or an old engine in the scrapper’s yard—is certainly not conducive to a vivid realisation of the doctrine of the resurrection.’

‘No; but this absurd anxiety to be buried in some particular place has nothing to do with religious belief; it is merely silly sentiment.’

‘It is sentiment, I admit,’ said Thorndyke, ‘but I wouldn’t call it silly. The feeling is so widespread in time and space that we must look on it with respect as something inherent in human nature. Think—as doubtless John Bellingham did—of the ancient Egyptians, whose chief aspiration was that of everlasting repose for the dead. See the trouble they took to achieve it. Think of the great Pyramid, or that of Amenemhat the Fourth with its labyrinth of false passages and its sealed and hidden sepulchral chambers. Think of Jacob, borne after death all those hundreds of weary miles in order that he might sleep with his fathers, and then remember Shakespeare and his solemn adjuration to posterity to let him rest undisturbed in his grave. No, Berkeley, it is not a silly sentiment. I am as indifferent as you as to what becomes of my body “when I have done with it,” to use your irreverent phrase; but I recognise the solicitude that some other men display on the subject as a natural feeling that has to be taken seriously.’

‘But even so,’ I said, ‘if this man had a hankering for a freehold residence in some particular bone-yard, he might have gone about the business in a more reasonable way.’

‘There I am entirely with you,’ Thorndyke replied. ‘It is the absurd way in which this provision is worded that not only creates all the trouble but also makes the whole document so curiously significant in view of the testator’s disappearance.’

‘How significant?’ Jervis demanded eagerly.

‘Let us consider the provisions of the will point by point,’ said Thorndyke; ‘and first note that the testator commanded the services of a very capable lawyer.’

‘But Mr. Jellicoe disapproved of the will,’ said I; ‘in fact, he protested strongly against the form of it.’

‘We will bear that in mind too,’ Thorndyke replied. ‘And now with reference to what we may call the contentious clauses:
the first thing that strikes us is their preposterous injustice. Godfrey's inheritance is made conditional on a particular disposal of the testator's body. But this is a matter not necessarily under Godfrey's control. The testator might have been lost at sea, or killed in a fire or explosion, or have died abroad and been buried where his grave could not have been identified. There are numerous probable contingencies besides the improbable one that has happened that might prevent the body from being recovered.

‘But even if the body had been recovered, there is another difficulty. The places of burial in the parishes have all been closed for many years. It would be impossible to reopen any of them without a special faculty, and I doubt whether such a faculty would be granted. Possibly cremation might meet the difficulty, but even that is doubtful; and, in any case, the matter would not be in the control of Godfrey Bellingham. Yet, if the required interment should prove impossible, he is to be deprived of his legacy.’

‘It is a monstrous and absurd injustice,’ I exclaimed.

‘It is,’ Thorndyke agreed; ‘but this is nothing to the absurdity that comes to light when we consider clauses two and three in detail. Observe that the testator presumably wished to be buried in a certain place; also he wished his brother should benefit under the will. Let us take the first point and see how he has set about securing the accomplishment of what he desired. Now if we read clauses two and three carefully, we shall see that he has rendered it virtually impossible that his wishes can be carried out. He desires to be buried in a certain place and makes Godfrey responsible for his being so buried. But he gives Godfrey no power or authority to carry out the provision, and places insuperable obstacles in his way. For until Godfrey is an executor, he has no power or authority to carry out the provisions; and until the provisions are carried out, he does not become an executor.’

‘It is a preposterous muddle,’ exclaimed Jervis.

‘Yes, but that is not the worst of it,’ Thorndyke continued. ‘The moment John Bellingham dies, his dead body has come into existence; and it is “deposited”, for the time being, wherever he happens to have died. But unless he should happen to have died in one of the places of burial mentioned—which is in the highest degree unlikely—his body will be, for the time being, “deposited” in some place other than those specified. In that case clause two is—for the time being—not complied with, and consequently George Hurst becomes, automatically, the co-executor.

‘But will George Hurst carry out the provisions of clause two? Probably not. Why should he? The will contains no instructions to that effect. It throws the whole duty on Godfrey. On the other hand, if he should carry out clause two, what happens? He ceases to be an executor and he loses some seventy thousand pounds. We may be pretty certain that he will do nothing of the kind. So that, on considering the two clauses, we see that the wishes of the testator could only be carried out in the unlikely event of his dying in one of the burial-places mentioned, or his body being conveyed immediately after death to p. public mortuary in one of the said parishes. In any other event, it is virtually certain that he will be buried in some place other than that which he desired, and that his brother will be left absolutely without provision or recognition.’

‘John Bellingham could never have intended that,’ I said.

‘Clearly not,’ agreed Thorndyke; ‘the provisions of the will furnish internal evidence that he did not. You note that he bequeathed five thousand pounds to George Hurst, in the event of clause two being carried out; but he has made no bequest to his brother in the event of its not being carried out. Obviously, he had not entertained the possibility of this contingency at all. He assumed, as a matter of course, that the conditions of clause two would be fulfilled, and regarded the conditions themselves as a mere formality.’

‘But,’ Jervis objected, ‘Jellicoe must have seen the danger of a miscarriage and pointed it out to his client.’

‘Exactly,’ said Thorndyke. ‘There is the mystery. We understand that he objected strenuously, and that John Bellingham was obsturate. Now it is perfectly understandable that a man should adhere obstinately to the most stupid and perverse disposition of words after it has been proved to him that the use of such form will almost certainly result in the defeat of his own wishes; that, I say, is a mystery that calls for very careful consideration.’

‘If Jellicoe had been an interested party,’ said Jervis, ‘one would have suspected him of lying low. But the form of clause two doesn’t affect him at all.’

‘No,’ said Thorndyke; ‘the person who stands to profit by the muddle is George Hurst. But we understand that he was unacquainted with the terms of the will, and there is certainly nothing to suggest that he is in any way responsible for it.’

‘The practical question is,’ said I, ‘what is going to happen? and what can be done for the Bellinghams?’

The probability is,’ Thorndyke replied, ‘that the next move will be made by Hurst. He is the party immediately interested. He will probably apply to the Court for permission to presume death and administer the will.’

‘And what will the Court do?’

Thorndyke smiled dryly. ‘Now you are asking a very pretty conundrum. The decisions of Courts depend on idiosyncrasies of temperament that no one can foresee. But one may say that a Court does not lightly grant permission to presume death. There will be a rigorous inquiry—and a decidedly unpleasant one, I suspect—and the evidence will be reviewed by the judge with a strong predisposition to regard the testator as being still alive. On the other hand, the known facts point very distinctly to the probability that he is dead; and, if the will were less complicated and all the parties interested were
unanimous in supporting the application, I don’t see why it might not be granted. But it will clearly be to the interest of Godfrey to oppose the application, unless he can show that the conditions of clause two have been complied with—which it is virtually certain he cannot; and he may be able to bring forward reasons for believing John to be still alive. But even if he is unable to do this, inasmuch as it is pretty clear that he was intended to be the chief beneficiary, his opposition is likely to have considerable weight with the Court."

"Oh, is it?" I exclaimed eagerly. ‘Then that accounts for a very peculiar proceeding on the part of Hurst. I have stupidly forgotten to tell you about it. He has been trying to come to a private agreement with Godfrey Bellingham.’

‘Indeed!’ said Thorndyke. ‘What sort of agreement?’

‘His proposal was this: that Godfrey should support him and Jellicoe in an application to the Court for permission to presume death and to administer the will, that if it was successful, Hurst should pay him four hundred pounds a year for life: the arrangement to hold good in all eventualities."

‘By which he means?’

‘That if the body should be discovered at any future time, so that the conditions of clause two could be carried out, Hurst should still retain the property and continue to pay Godfrey the four hundred a year for life.’

‘Hey, ho!’ exclaimed Thorndyke; ‘that is a queer proposal; a very queer proposal indeed.’

‘Not to say fishy,’ added Jervis. ‘I don’t fancy the Court would look with approval on that little arrangement.’

‘The law does not look with much favour on any little arrangements that aim at getting behind the provisions of a will,’ Thorndyke replied; ‘though there would be nothing to complain of in this proposal if it were not for the reference to “all eventualities”. If a will is hopelessly impracticable, it is not unreasonable or improper for the various beneficiaries to make such private arrangements among themselves as may seem necessary to avoid useless litigation and delay in administering the will. If, for instance, Hurst had proposed to pay four hundred a year to Godfrey so long as the body remained undiscovered on condition that, in the event of discovery, Godfrey should pay him a like sum for life, there would have been nothing to comment upon. It would have been an ordinary sporting chance. But the reference to “all eventualities” is an entirely different matter. Of course, it may be mere greediness, but all the same it suggests some very curious reflections.’

‘Yes, it does,’ said Jervis. ‘I wonder if he has any reason to expect that the body will be found? Of course it doesn’t follow that he has. He may be merely taking the opportunity offered by the other man’s poverty to make sure of the bulk of the property whatever happens. But it is uncommonly sharp practice, to say the least.’

‘Do I understand that Godfrey declined the proposal?’ Thorndyke asked.

‘Yes, he did, very emphatically; and I fancy the two gentlemen proceeded to exchange opinions on the circumstances of the disappearance with more frankness than delicacy.’

‘Ah,’ said Thorndyke, ‘that is a pity. If the case comes into Court, there is bound to be a good deal of unpleasant discussion and still more unpleasant comment in the newspapers. But if the parties themselves begin to express suspicions of one another there is no telling where the matter will end.’

‘No, by Jove!’ said Jervis. ‘If they begin flinging accusations of murder about, the fat will be in the fire with a vengeance. That way lies the Old Bailey.’

‘We must try to prevent them from making an unnecessary scandal,’ said Thorndyke. ‘It may be that an exposure will be unavoidable, and that must be ascertained in advance. But to return to your question, Berkeley, as to what is to be done. Hurst will probably make some move pretty soon. Do you know if Jellicoe will act with him?’

‘No, he won’t. He declines to take any steps without Godfrey’s assent—at least, that is what he says at present. His attitude is one of correct neutrality.’

‘That is satisfactory so far,’ said Thorndyke, ‘though he may alter his tone when the case comes into Court. From what you said just now I gathered that Jellicoe would prefer to have the will administered and be quit of the whole business; which is natural enough, especially as he benefits under the will to the extent of two thousand pounds and a valuable collection. Consequently, we may fairly assume that, even if he maintains an apparent neutrality, his influence will be exerted in favour of Hurst rather than of Bellingham; from which it follows that Bellingham ought certainly to be properly advised, and, when the case goes into Court, properly represented.’

‘He can’t afford either the one or the other,’ said I. ‘He’s as poor as an insolvent church mouse and as proud as the devil. He wouldn’t accept professional aid that he couldn’t pay for.’

‘If’m,’ grunted Thorndyke, ‘that’s awkward. But we can’t allow the case to go “by default”, so to speak—to fail for the mere lack of technical assistance. Besides, it is one of the most interesting cases that I have ever met with, and I am not going to see it bungled. He couldn’t object to a little general advice in a friendly, informal way—amicus curia, as old Brodribb is so fond of saying; and there is nothing to prevent us from pushing forward the preliminary inquiries.’

‘Of what nature would they be?’

‘Well, to begin with, we have to satisfy ourselves that the conditions of clause two have not been complied with: that
John Bellingham has not been buried within the parish boundaries mentioned. Of course he has not, but we must not take anything for granted. Then we have to satisfy ourselves that he is not still alive and accessible. It is perfectly possible that he is, after all, and it is our business to trace him, if he is still in the land of the living. Jervis and I can carry out these investigations without saying anything to Bellingham; my learned brother will look through the register of burials—not forgetting the cremations—in the metropolitan area, and I will take the other matter in hand.

‘You really think that John Bellingham may still be alive?’ said I.

‘Since his body has not been found, it is obviously a possibility. I think it in the highest degree improbable, but the improbable has to be investigated before it can be excluded.’

‘It sounds rather a hopeless quest,’ I remarked. ‘How do you propose to begin?’

‘I think of beginning at the British Museum. The people there may be able to throw some light on his movements. I know that there are some important evacuations in progress at Heliopolis—in fact, the Director of the Egyptian Department is out there at the present moment; and Doctor Norbury, who is taking his place temporarily, is an old friend of Bellingham’s. I shall call on him and try to discover if there is anything that might have induced Bellingham suddenly to go abroad—to Heliopolis, for instance. Also he may be able to tell me what it was that took the missing man to Paris on that last, rather mysterious journey. That might turn out to be an important clue. And meanwhile, Berkeley, you must endeavour tactfully to reconcile your friend to the idea of letting us give an eye to the case. Make it clear to him that I am doing this entirely for the enlargement of my own knowledge.’

‘But won’t you have to be instructed by a solicitor?’ I asked.

‘Yes, nominally; but only as a matter of etiquette. We shall do all the actual work. Why do you ask?’

‘I was thinking of the solicitor’s costs, and I was going to mention that I have a little money of my own—’

‘Then you keep it, my dear fellow. You’ll want it when you go into practice. There will be no difficulty about the solicitor; I shall ask one of my friends to act nominally as a personal favour to me—Marchmont would take the case for us, Jervis, I am sure.’

‘Yes,’ said Jervis. ‘Or old Brodribb, if we put it to him amicus curia.’

‘It is excessively kind of both of you to take this benevolent interest in the case of my friends,’ I said; ‘and it is to be hoped that they won’t be foolishly proud and stiff-necked about it. It’s rather the way with poor gentlefolk.’

‘I’ll tell you what!’ exclaimed Jervis. ‘I have a most brilliant idea. You shall give us a little supper at your rooms and invite the Bellinghams to meet us. Then you and I will attack the old gentleman, and Thorndyke shall exercise his persuasive powers on the lady. These chronic incurable old bachelors, you know, are quite irresistible.’

‘You observe that my respected junior condemns me to lifelong celibacy,’ Thorndyke remarked. ‘But,’ he added, ‘his suggestion is quite a good one. Of course, we mustn’t put any sort of pressure on Bellingham to employ us—for that is what it amounts to, even if we accept no payment—but a friendly talk over the supper-table would enable us to put the matter delicately and yet convincingly.’

‘Yes,’ said I, ‘I see that, and I like the idea immensely. But it won’t be possible for several days, because I’ve got a job that takes up all my spare time—and that I ought to be at work on now,’ I added, with a sudden qualm at the way in which I had forgotten the passage of time in the interest of Thorndyke’s analysis.

My two friends looked at me inquiringly and I felt it necessary to explain about the injured hand and the Tell el Amarna tablets; which I accordingly did rather shly and with a nervous eye upon Jervis. The slow grin, however, for which I was watching, never came; on the contrary, he not only heard me through quite gravely, but when I had finished said with some warmth, and using my old hospital pet name:

‘I’ll say one thing for you, Polly; you’re a good chum, and you always were. I hope your Nevill’s Court friends appreciate the fact.’

They are far more appreciative than the occasion warrants,’ I answered. ‘But to return to this question: how will this day week suit you?’

‘It will suit me,’ Thorndyke answered, with a glance at his junior.

‘And me too,’ said the latter; ‘so, if it will do for the Bellinghams, we will consider it settled; but if they can’t come, you must fix another night.’

‘Very well,’ I said, rising and knocking out my pipe, ‘I will issue the invitation to-morrow. And now I must be off to have another slog at those notes.’

As I walked homewards I speculated cheerfully on the prospect of entertaining my friends under my own (or rather Barnard’s) roof, if they could be lured out of their ereitical retirement. The idea had, in fact, occurred to me already, but I had been deterred by the peculiarities of Barnard’s housekeeper. For Mrs. Gummer was one of those housewives who make up for an archaic simplicity of production by preparations on the most portentous and alarming scale. But this time I would not be deterred. If only the guests could be enticed into my humble lair it would be easy to furnish the raw materials of the feast from outside; and the consideration of ways and means occupied me pleasantly until I found myself once more
at my writing-table, confronted by my voluminous notes on the incidents of the North Syrian War.

VIII. — A MUSEUM IDYLL

WHETHER it was that practice revived a forgotten skill on my part, or that Miss Bellingham had over-estimated the amount of work to be done, I am unable to say. But whichever may have been the explanation, the fact is that the fourth afternoon saw our task so nearly completed that I was fain to plead that a small remainder might be left over to form an excuse for yet one more visit to the reading-room.

Short, however, as had been the period of our collaboration, it had been long enough to produce a great change in our relations to one another. For there is no friendship so intimate and satisfying as that engendered by community of work, and none—between man and woman, at any rate—so frank and wholesome.

Every day had arrived to find a pile of books with the places duly marked and the blue-covered quarto notebooks in readiness. Every day we had worked steadily at the allotted task, had then handed in the books and gone forth together to enjoy a most companionable tea in the milk-shop; thereafter to walk home by way of Queen Square, talking over the day's work and discussing the state of the world in the far-off days when Ahkhenaten was king and the Tell el Amarna tablets were a-writing.

It had been a pleasant time, so pleasant, that as I handed in the books for the last time, I sighed to think that it was over; that not only was the task finished, but that the recovery of my fair patient's hand, from which I had that morning removed the splint, had put an end to the need of my help.

'What shall we do?' I asked, as we came out into the central hall. 'It is too early for tea. Shall we go and look at some of the galleries?'

'Why not?' she answered. 'We might look over some of the things connected with what we have been doing. For instance, there is a relief of Ahkhenaten upstairs in the Third Egyptian Room; we might go and look at it.'

I fell in eagerly with the suggestion, placing myself under her experienced guidance, and we started by way of the Roman Gallery, past the long row of extremely commonplace and modern-looking Roman Emperors.

'I don't know,' she said, pausing for a moment opposite a bust labelled 'Trajan' (but obviously a portrait of Phil May), 'how I am ever even to thank you for all that you have done, to say nothing of repayment.'

'There is no need to do either,' I replied. 'I have enjoyed working with you so I have had my reward. But still,' I added, 'if you want to do me a great kindness, you have it in your power.'

'How?'

'In connection with my friend, Doctor Thorndyke. I told you he was an enthusiast. Now he is, for some reason, most keenly interested in everything relating to your uncle, and I happen to know that, if any legal proceedings should take place, he would very much like to keep a friendly eye on the case.'

'And what do you want me to do?'

'I want you, if an opportunity should occur for him to give your father advice or help of any kind, to use your influence with your father in favour of, rather than in opposition to, his accepting it—always assuming that you have no real feeling against his doing so.'

Miss Bellingham looked at me thoughtfully for a few moments, and then laughed softly.

'So the great kindness that I am to do you is to let you do me a further kindness through your friend!'

'No,' I protested; 'that is where you are mistaken. It isn't benevolence on Doctor Thorndyke's part; it's professional enthusiasm.'

She smiled sceptically.

'You don't believe in it,' I said; 'but consider other cases. Why does a surgeon get out of bed on a winter's night to do an emergency operation at a hospital? He doesn't get paid for it. Do you think it is altruism?'

'Yes, of course. Isn't it?'

'Certainly not. He does it because it is his job, because it is his business to fight with disease—and win.'

'I don't see much difference,' she said. 'It's work done for love instead of for payment. However, I will do as you ask if the opportunity arises; but I shan't suppose that I am repaying your kindness to me.'

'I don't mind so long as you do it,' I said, and we walked on for some time in silence.

'Isn't it odd,' she said presently, 'how our talk always seems to come back to my uncle? Oh, and that reminds me that the things he gave to the Museum are in the same room as the Ahkhenaten relief. Would you like to see them?'

'Of course I should.'

'Then we will go and look at them first.' She paused, and then, rather shyly and with a rising colour, she continued: 'And
I think I should like to introduce you to a very dear friend of mine—with your permission, of course.’

This last addition she made hastily, seeing, I suppose, that I looked rather glum at the suggestion. Inwardly I consigned her friend to the devil, especially if of the masculine gender; outwardly I expressed my felicity at making the acquaintance of any person whom she should honour with her friendship. Whereat, to my discomfiture, she laughed enigmatically; a very soft laugh, low-pitched and musical, like the cooing of a glorified pigeon.

I strolled on by her side, speculating a little anxiously on the coming introduction. Was I being conducted to the lair of one of the servants attached to the establishment? and would he add a superfluous third to our little party of two, so complete and companionable, solus cum sola, in this populated wilderness? Above all, would he turn out to be a young man, and bring my aerial castles tumbling about my ears. The shy look and the blush with which she had suggested the introduction were ominous indications, upon which I mused gloomily as we ascended the stairs and passed through the wide doorway. I glanced apprehensively at my companion, and met a quiet, inscrutable smile; and at that moment she halted opposite a wall-case and faced me.

‘This is my friend,’ she said. ‘Let me present you to Artemidorus, late of the Fayyum. Oh, don’t smile!’ she pleaded. ‘I am quite serious. Have you never heard of pious Catholics who cherish a devotion to some long-departed saint? That is my feeling towards Artemidorus, and if you only knew what comfort he has shed into the heart of a lonely woman; what a quiet, unobtrusive friend he has been to me in my solitary, friendless days, always ready with a kindly greeting on his gentle, thoughtful face, you would like him for that alone. And I want you to like him and to share our silent friendship. Am I very silly, very sentimental?’

A wave of relief swept over me, and the mercury of my emotional thermometer, which had shrunk almost into the bulb, leaped up to normal heat. How charming it was of her and how sweetly intimate, to wish to share this mystical friendship with me! And what a pretty conceit it was, too, and how like this strange, inscrutable maiden, to come here and hold silent converse with this long-departed Greek. And the pathos of it all touched me deeply amidst the joy of this new-born intimacy.

‘Are you scornful?’ she asked, with a shade of disappointment, as I made no reply.

‘No, indeed I am not,’ I answered earnestly. ‘I want to make you aware of my sympathy and my appreciation without offending you by seeming to exaggerate, and I don’t know how to express it.’ Oh, never mind about the expression, so long as you feel it. I thought you would understand,’ and she gave me a smile that made me tingle to my finger-tips.

We stood awhile gazing in silence at the mummy—for such, indeed, was her friend Artemidorus. But not an ordinary mummy. Egyptian in form, it was entirely Greek in feeling; and brightly coloured as it was, in accordance with the racial love of colour, the tasteful refinement with which the decoration of the case was treated made those around look garish and barbaric. But the most striking feature was a charming panel picture which occupied the place of the usual mask. This painting was a revelation to me. Except that it was executed in tempera instead of oil, it differed in no respect from modern work. There was nothing archaic or ancient about it. With its freedom of handling and its correct rendering of light and shade, it might have been painted yesterday; indeed, enclosed in an ordinary gilt frame, it might have passed without remark in an exhibition of modern portraits.

Miss Bellingham observed my admiration and smiled approvingly.

‘It is a charming little portrait, isn’t it?’ she said; ‘and such a sweet face too; so thoughtful and human, with a shade of melancholy. But the whole thing is full of charm. I fell in love with it the first time I saw it. And it is so Greek!’

‘Yes, it is, in spite of the Egyptian gods and symbols.’

‘Rather because of them, I think,’ said she. ‘There we have the typical Greek attitude, the genial, cultivated electricism that appreciated the fitness of even the most alien forms of art. There is Anubis standing beside the bier; there are Isis and Nephthys, and there below Horus and Tahuti. But we can’t suppose Artemidorus worshipped or believed in those gods. They are there because they are splendid decoration and perfectly appropriate in character. The real feeling of those who loved the dead man breaks out in the inscription.’ She pointed to a band below the pectoral, where, in gilt capital letters, was written the two words, (Greek).

‘Yes,’ I said, ‘it is very dignified and very human.’

‘And so sincere and full of real emotion,’ she added. ‘I find it unspeakably touching. “O Artemidorus, farewell!” There is the real note of human grief, the sorrow of eternal parting. How much finer it is than the vulgar boastfulness of the Semitic epitaphs, or our own miserable, insincere make-believe of the “Not lost but gone before” type. He has gone from them for ever; they would look on his face and hear his voice no more; they realised that this was their last farewell. Oh, there is a world of love and sorrow in those two simple words!’

For some time neither of us spoke. The glamour of this touching memorial of a long-buried grief had stolen over me, and I was content to stand silent by my beloved companion and revive, with a certain pensive pleasure, the ghosts of human emotions over which the many centuries had rolled. Presently she turned to me with a frank smile. ‘You have been weighed in the balance of friendship,’ she said, ‘and not found wanting. You have the gift of sympathy, even with a woman’s sentimental fancies.’

I suspected that a good many men would have developed this precious quality under the circumstances, but I refrained from saying so. There is no use in crying down one’s own wares. I was glad enough to have earned her good opinion so
easily, and when she at length turned away from the case and passed through into the adjoining room, it was a very complacent young man who bore her company.

‘Here is Ahkhenaten—or Khu-en-aten, as the authorities here render the hieroglyphics. She indicated a fragment of a coloured relief labelled: ‘Portion of a painted stone tablet with a portrait figure of Amenhotep IV, and we stopped to look at the frail, effeminate figure of the great king, with his large cranium, his queer, pointed chin, and the Aten rays stretching out their weird hands as if caressing him.

‘We mustn’t stay here if you want to see my uncle’s gift, because this room closes at four to-day.’ With this admonition she moved on to the other end of the room, where she halted before a large floor-case containing a mummy and a large number of other objects. A black label with white lettering set forth the various contents with a brief explanation as follows:

‘Mummy of Sebekhotep, a scribe of the twenty-second dynasty, together with the objects found in the tomb. These include the four Canopic jars, in which the internal organs were deposited, the Ushabti figures, tomb provisions and various articles that had belonged to the deceased; his favourite chair, his head-rest, his ink-palette, inscribed with his name and the name of the king, Osorkon I, in whose reign he lived, and other smaller articles. Presented by John Bellingham, Esq.’

‘They have put all the objects together in one case,’ Miss Bellingham explained, ‘to show the contents of an ordinary tomb of the better class. You see that the dead man was provided with all his ordinary comforts: provisions, furniture, the ink-palette that he had been accustomed to use in writing on papyri, and a staff of servants to wait on him.’

‘Where are the servants?’ I asked.

‘The little Ushabti figures,’ she answered; ‘they were the attendants of the dead, you know, his servants in the underworld. It was a quaint idea, wasn’t it? But it was all very complete and consistent, and quite reasonable, too, if one once accepts the belief in the persistence of the individual apart from the body.’

‘Yes,’ I agreed, ‘and that is the only fair way to judge a religious system, by taking the main beliefs for granted. But what a business it must have been, bringing all these things from Egypt to London.’

‘It was worth the trouble, though, for it is a fine and instructive collection. And the work is all very good of its kind. You notice that the Ushabti figures and the heads that form the stoppers of the Canopic jars are quite finely modelled. The mummy itself, too, is rather handsome, though that coat of bitumen on the back doesn’t improve it. But Sebekhotep must have been a fine-looking man.’

‘The mask on the face is a portrait, I suppose?’

‘Yes; in fact, it’s rather more. To some extent it is the actual face of the man himself. This mummy is enclosed in what is called a cartonnage, that is a case moulded on the figure. The cartonnage was formed of a number of layers of linen or papyrus united by glue or cement, and when the case had been fitted to a mummy it was moulded to the body, so that the general form of the features and limbs was often apparent. After the cement was dry the case was covered with a thin layer of stucco and the face modelled more completely, and then decorations and inscriptions were painted on. So that, you see, in a cartonnage, the body was sealed up like a nut in its shell, unlike the more ancient forms in which the mummy was merely rolled up and enclosed in a wooden coffin.’

At this moment there smote upon our ears a politely protesting voice announcing in sing-song tones that it was closing time; and simultaneously a desire for tea suggested the hospitable milk-shop. With leisurely dignity that ignored the official who shepherded us along the galleries, we made our way to the entrance, still immersed in conversation on matters sepulchral.

It was rather earlier than our usual hour for leaving the Museum and, moreover, it was our last day—for the present. Wherefore we lingered over our tea to an extent that caused the milk-shop lady to view us with some disfavour, and when at length we started homeward, we took so many short cuts that six o’clock found us no nearer our destination than Lincoln’s Inn Fields; whither we had journeyed by a slightly indirect route that traversed (among other places) Russell Square, Red Lion Square, with the quaint passage of the same name, Bedford Row, Jockey’s Fields, Hand Court, and Great Turnstile.

It was in the latter thoroughfare that our attention was attracted by a flaming poster outside a newsvendor’s bearing the startling inscription:

MORE MEMENTOES
OF MURDERED MAN
.

Miss Bellingham glanced at the poster and shuddered.

‘Horrible, isn’t it?’ she said. ‘Have you read about them?’

‘I haven’t been noticing the papers the last few days,’ I replied.

‘No, of course you haven’t. You’ve been slaving at those wretched notes. We don’t very often see the papers, at least we
don't take them in, but Miss Oman has kept us supplied during the last day or two. She is a perfect little ghoul; she delights in horrors of every kind, and the more horrible the better.'

'But,' I asked, 'what is it they have found?'

'Oh, they are the remains of some poor creature who seems to have been murdered and cut into pieces. It is dreadful. It made me shudder to read of it, for I couldn't help thinking of poor Uncle John, and, as for my father, he was really quite upset.'

'Are these the bones that were found in a watercress-bed at Sidcup?'

'Yes, but they have found several more. The police have been most energetic. They seem to have been making a systematic search, and the result has been that they have discovered several portions of the body, scattered about in very widely separated places—Sidcup, Lee, St Mary Cray; and yesterday it was reported that an arm had been found in one of the ponds called “the Cuckoo Pits,” close to our old home.'

'What! in Essex?' I exclaimed.

'Yes, in Epping Forest, quite near Woodford. Isn't it dreadful to think of it? They were probably hidden when we were living there. I think it was that that horrified my father so much. When he read it he was so upset that he gathered up the whole bundle of newspapers and tossed them out of the window; and they blew over the wall, and poor Miss Oman had to rush and pursue them up the court.'

'Do you think he suspects that these remains may be those of your uncle?'

'I think so, though he has said nothing to that effect, and, of course, I have not made any suggestion to him. We always preserve the fiction between ourselves of believing that Uncle John is still alive.'

'But you don't think he is, do you?'

'No, I'm afraid I don't; and I feel pretty sure that my father doesn't think so either, but he doesn't like to admit it to me.'

'Do you happen to remember what bones have been found?'

'No, I don't. I know that an arm was found in the Cuckoo Pits, and I think a thigh-bone was dredged up out of a pond near St Mary Cray. But Miss Oman will be able to tell you all about it, if you are interested. She will be delighted to meet a kindred spirit,' Miss Bellingham added, with a smile.

'I don't know that I claim spiritual kinship with a ghoul,' said I; 'especially such a very sharp-tempered ghoul.'

'Oh, don't disparage her, Doctor Berkeley!' Miss Bellingham pleaded. 'She isn't really bad-tempered; only a little prickly on the surface. I oughtn't to have called her a ghoul; she is just the sweetest, most affectionate, most unselfish little angelic human hedgehog that you could find if you travelled the wide world through. Do you know that she has been working her fingers to the bone making an old dress of mine presentable because she is so anxious that I shall look nice at your little supper party.'

'You are sure to do that, in any case,' I said; 'but I withdraw my remark as to her temper unreservedly. And I really didn't mean it, you know; I have always liked the little lady.'

'That's right; and now won't you come in and have a few minutes’ chat with my father? We are quite early in spite of the short cuts.'

I accepted readily, and the more so inasmuch as I wanted a few words with Miss Oman on the subject of catering and did not want to discuss it before my friends. Accordingly I went and gossiped with Mr. Bellingham, chiefly about the work we had done at the Museum, until it was time for me to return to the surgery.

Having taken my leave, I walked down the stairs with reflective slowness and as much creaking of my boots as I could manage; with the result, hopefully anticipated, that as I approached the door of Miss Oman's room it opened and the lady's head protruded.

'I'd change my cobbler if I were you,' she said.

I thought of the 'angelic human hedgehog', and nearly sniggered in her face.

'I am sure you would, Miss Oman, instantly; though, mind you, the poor fellow can't help his looks.'

'You are a very flippant young man,' she said severely. Whereat I grinned, and she regarded me silently with a baleful glare. Suddenly I remembered my mission and became serious and sober.

'Miss Oman,' I said, 'I very much want to take your advice on a matter of some importance—to me, at least.' (That ought to fetch her, I thought. The 'advice fly'—strangely neglected by Izaak Walton—is guaranteed to kill in any weather.) And it did fetch her. She rose in a flash and gorged it, cock's feathers, worsted body and all.

'What is it about?' she asked eagerly. 'But don't stand out here where everybody can hear but me. Come in and sit down.'

Now I didn't want to discuss the matter here, and, besides, there was not time. I therefore assumed an air of mystery.

'I can't, Miss Oman. I'm due at the surgery now. But if you should be passing and should have a few minutes to spare, I should be greatly obliged if you would look in. I really don't quite know how to act.'
‘No, I expect not. Men very seldom do. But you’re better than most, for you know when you are in difficulties and have the sense to consult a woman. But what is it about? Perhaps I might be thinking it over.’

‘Well, you know,’ I began evasively, ‘it’s a simple matter, but I can’t very well—no, by Jove!’ I added, looking at my watch, ‘I must run, or I shall keep the multitude waiting.’ And with this I hustled away, leaving her literally dancing with curiosity.

IX. — THE SPHINX OF LINCOLN’S INN

AT the age of twenty-six one cannot claim to have attained to the position of a person of experience. Nevertheless, the knowledge of human nature accumulated in that brief period sufficed to make me feel confident that, at some time during the evening, I should receive a visit from Miss Oman. And circumstances justified my confidence; for the clock yet stood at two minutes to seven when a premonitory tap at the surgery door heralded her arrival.

‘I happened to be passing,’ she explained, and I forbore to smile at the coincidence, ‘so I thought I might as well drop in and hear what you wanted to ask me about.’

She seated herself in the patients’ chair and laying a bundle of newspapers on the table, glared at me expectantly.

‘Thank you, Miss Oman,’ said I. ‘It is very good of you to look in on me. I am ashamed to give you all this trouble about such a trifling matter.’

She rapped her knuckles impatiently on the table.

‘Never mind about the trouble,’ she exclaimed tartly. ‘What—is—it—that—you—want—to—ask—me about?’

I stated my difficulties in respect of the supper-party, and, as I proceeded, an expression of disgust and disappointment spread over her countenance.

‘I don’t see why you need have been so mysterious about it,’ she said glumly.

‘I didn’t mean to be mysterious; I was only anxious not to make a mess of the affair. It’s all very fine to assume a lofty scorn of the pleasures of the table, but there is great virtue in a really good feed, especially when low-living and high-thinking have been the order of the day.’

‘Coarsely put,’ said Miss Oman, ‘but perfectly true.’

‘Very well. Now, if I leave the management to Mrs. Gummer, she will probably provide a tepid Irish stew with flakes of congealed fat on it, and a plastic suet-pudding or something of that kind, and turn the house upside down in getting it ready. So I thought of having a cold spread and getting the things from outside. But I don’t want it to look as if I had been making enormous preparations.’

‘They won’t think the things came down from heaven,’ said Miss Oman.

‘No, I suppose they won’t. But you know what I mean. Now, where do you advise me to go for the raw materials of conviviality?’

Miss Oman reflected. ‘You had better let me do your shopping and manage the whole business,’ was her final verdict.

This was precisely what I wanted, and I accepted thankfully, regardless of the feelings of Mrs. Gummer. I handed her two pounds, and, after some protests at my extravagance, she bestowed them in her purse; a process that occupied time, since that receptacle, besides being a sort of miniature Record Office of frayed and time-stained bills, already bulged with a lading of draper’s samples, ends of tape, a card of linen buttons, another of hooks and eyes, a lump of beeswax, a rat-eaten stump of lead-pencil, and other trifles that I have forgotten. As she closed the purse at the imminent risk of wrenching off its fastenings she looked at me severely and pursed her lips.

‘You’re a very plausible young man,’ she remarked.

‘What makes you say that?’ I asked.

‘Philandering about museums,’ she continued, ‘with handsome young ladies on the pretence of work. Work, indeed! Oh, I heard her telling her father about it. She thinks you were perfectly enthralled by the mummies and dried cats and chunks of stone and all the other trash. She doesn’t know what humbugs men are.’

‘Really, Miss Oman—’ I began.

‘Oh, don’t talk to me!’ she snapped. ‘I can see it all. You can’t impose upon me. I can see you staring into those glass cases, egging her on to talk and listening open-mouthed and bulging-eyed and sitting at her feet—now, didn’t you?’

‘I don’t know about sitting at her feet,’ I said, ‘though it might easily have come to that with those infernal slippery floors; but I had a very jolly time, and I mean to go again if I can. Miss Bellingham is the cleverest and most accomplished woman I have ever spoken to.’

This was a poser for Miss Oman, whose admiration and loyalty, I knew, were only equalled by my own. She would have liked to contradict me, but the thing was impossible. To cover her defeat she snatched up the bundle of newspapers and began to open them out.
‘What sort of stuff is “hibernation”?’ she demanded suddenly.

‘Hibernation!’ I exclaimed.

‘Yes. They found a patch of it on a bone that was discovered in a pond at St Mary Cray, and a similar patch on one that was found at some other place in Essex. Now, I want to know what “hibernation” is.’

‘You must mean “eburnation,”’ I said, after a moment’s reflection.

‘The newspapers say “hibernation,” and I suppose they know what they are talking about. If you don’t know what it is, don’t be ashamed to say so.’

‘Well, then, I don’t.’

‘In that case you had better read the papers and find out,’ she said, a little illogically. And then: ‘Are you fond of murders? I am, awfully.’

‘What a shocking little ghoul you must be!’ I exclaimed.

She stuck out her chin at me. I’ll trouble you,’ she said, ‘to be a little more respectful in your language. Do you realise that I am old enough to be your mother?’

‘Impossible!’ I ejaculated.

‘Fact,’ said Miss Oman.

‘Well, anyhow,’ said I, ‘age is not the only qualification. And besides, you are too late for the billet. The vacancy’s filled.’

Miss Oman slapped the papers down on the table and rose abruptly.

‘You had better read the papers and see if you can learn a little sense,’ she said severely as she turned to go. ‘Oh, and don’t forget the finger!’ she added eagerly. ‘That is really thrilling.’

‘The finger?’ I repeated.

‘Yes. They found a hand with one missing. The police think it is an important clue. I don’t know what they mean; but you read the account and tell me what you think.’

With this parting injunction she bustled out through the surgery, and I followed to bid her a ceremonious adieu on the doorstep. I watched her little figure tripping with quick, bird-like steps down Fetter Lane, and was about to turn back into the surgery when my attention was attracted by the evolutions of an elderly gentleman on the opposite side of the street. He was a somewhat peculiar-looking man, tall, gaunt, and bony, and the way in which he carried his head suggested to the medical mind a pronounced degree of near sight and a pair of deep spectacle glasses. Suddenly he espied me and crossed the road with his chin thrust forward and a pair of keen blue eyes directed at me through the centres of his spectacles.

‘I wonder if you can and will help me,’ said he, with a courteous salute. ‘I wish to call on an acquaintance, and I have forgotten his address. It is in some court, but the name of that court has escaped me for the moment. My friend’s name is Bellingham. I suppose you don’t chance to know it? Doctors know a great many people, as a rule.’

‘Do you mean Mr. Godfrey Bellingham?’

‘Ah! Then you do know him. I have not consulted the oracle in vain. He is a patient of yours, no doubt?’

‘A patient and personal friend. His address is Forty-nine Nevill’s Court.’

‘Thank you, thank you. Oh, and as you are a friend, perhaps you can inform me as to the customs of the household. I am not expected, and I do not wish to make an untimely visit. What are Mr. Bellingham’s habits as to his evening meal? Would this be a convenient time to call?’

‘I generally make my evening visits a little later than this—say about half-past eight; they have finished their meal by then.’

‘Ah! Half-past eight, then? Then I suppose I had better take a walk until that time. I don’t want to disturb them.’

‘Would you care to come in and smoke a cigar until it is time to make your call? If you would, I could walk over with you and show you the house.’

‘That is very kind of you,’ said my new acquaintance, with an inquisitive glance at me through his spectacles. ‘I think I should like to sit down. It’s a dull affair, mooning about the streets, and there isn’t time to go back to my chambers—in Lincoln’s Inn.’

‘I wonder,’ said I, as I ushered him into the room lately vacated by Miss Oman, ‘if you happen to be Mr. Jellicoe?’

He turned his spectacles full on me with a keen, suspicious glance. ‘What makes you think I am Mr. Jellicoe?’ he asked.

‘Oh, only that you live in Lincoln’s Inn.’

‘Ha! I see. I live in Lincoln’s Inn; Mr. Jellicoe lives in Lincoln’s Inn; therefore I am Mr. Jellicoe. Ha! ha! Bad logic, but a correct conclusion. Yes, I am Mr. Jellicoe. What do you know about me?’

‘Mighty little, excepting that you were the late John Bellingham’s man of business.’
‘The “late John Bellingham,” hey! How do you know he is the late John Bellingham?"

‘As a matter of fact, I don’t; only I rather understood that that was your own belief.’

‘You understood! Now from whom did you “understand” that? From Godfrey Bellingham? H’m! And how did he know what I believe? I never told him. It is a very unsafe thing, my dear sir, to expound another man’s beliefs.’

‘Then you think that John Bellingham is alive?’

‘Do I? Who said so? I did not, you know.’

‘But he must be either dead or alive.’

‘There,’ said Mr. Jellicoe, ‘I am entirely with you. You have stated an undeniable truth.’

‘It is not a very illuminating one, however,’ I replied, laughing.

‘Undeniable truths often are not,’ he retorted. ‘They are apt to be extremely general. In fact, I would affirm that the certainty of the truth of a given proposition is directly proportional to its generality.’

‘I suppose that is so,’ said I.

‘Undoubtedly. Take an instance from your own profession. Given a million normal human beings under twenty, and you can say with certainty that a majority of them will die before reaching a certain age, that they will die in certain circumstances and of certain diseases. Then take a single unit from that million, and what can you predict concerning him? Nothing. He may die to-morrow; he may live to be a couple of hundred. He may die of a cold in the head or a cut finger, or from falling off the cross of St Paul’s. In a particular case you can predict nothing.’

‘That is perfectly true,’ said I. And then realising that I had been led away from the topic of John Bellingham, I ventured to return to it.

‘That was a very mysterious affair—the disappearance of John Bellingham, I mean.’

‘Why mysterious?’ asked Mr. Jellicoe. ‘Men disappear from time to time, and when they reappear, the explanations that they give (when they give any) seem more or less adequate.’

‘But the circumstances were surely rather mysterious.’

‘What circumstances?’ asked Mr. Jellicoe.

‘I mean the way in which he vanished from Mr. Hurst’s house.’

‘In what way did he vanish from it?’

‘Well, of course, I don’t know.’

‘Precisely. Neither do I. Therefore I can’t say whether that way was a mysterious one or not.’

‘It is not even certain that he did leave it,’ I remarked, rather recklessly.

‘Exactly,’ said Mr. Jellicoe. ‘And if he did not, he is there still. And if he is there still, he has not disappeared—in the sense understood. And if he has not disappeared, there is no mystery.’

I laughed heartily, but Mr. Jellicoe preserved a wooden solemnity and continued to examine me through his spectacles (which I, in my turn, inspected and estimated at about minus five dioptres). There was something highly diverting about this grim lawyer, with his dry contentiousness and almost farcical caution. His ostentatious reserve encouraged me to ply him with fresh questions, the more indiscreet the better.

‘I suppose,’ said I, ‘that, under these circumstances, you would hardly favour Mr. Hurst’s proposal to apply for permission to presume death?’

‘Under what circumstances?’ he inquired.

‘I was referring to the doubt you have expressed as to whether John Bellingham is, after all, really dead.’

‘My dear sir,’ said he, ‘I fail to see your point. If it were certain that the man was alive, it would be impossible to presume that he was dead; and if it were certain that he was dead, presumption of death would still be impossible. You do not presume a certainty. The uncertainty is of the essence of the transaction.’

‘But,’ I persisted, ‘if you really believe that he may be alive, I should hardly have thought that you would take the responsibility of presuming his death and dispersing his property.’

‘I don’t,’ said Mr. Jellicoe. ‘I take no responsibility. I act in accordance with the decision of the Court and have no choice in the matter.’

‘But the Court may decide that he is dead and he may nevertheless be alive.’

‘Not at all. If the Court decides that he is presumably dead, then he is presumably dead. As a mere irrelevant, physical circumstance he may, it is true, be alive. But legally speaking, and for testamentary purposes, he is dead. You fail to perceive the distinction, no doubt?’

‘I am afraid I do,’ I admitted.
Yes; the members of your profession usually do. That is what makes them such bad witnesses in a court of law. The scientific outlook is radically different from the legal. The man of science relies on his own knowledge and observation and judgment, and disregards testimony. A man comes to you and tells you he is blind in one eye. Do you accept his statement? Not in the least. You proceed to test his eyesight with some infernal apparatus of coloured glasses, and you find that he can see perfectly well with both eyes. Then you decide that he is not blind in one eye; that is to say, you reject his testimony in favour of facts of your own ascertaining.’

‘But surely that is the rational method of coming to a conclusion?’

‘In science, no doubt. Not in law. A court of law must decide according to the evidence which is before it; and that evidence is of the nature of sworn testimony. If a witness is prepared to swear that black is white and no evidence to the contrary is offered, the evidence before the Court is that black is white, and the Court must decide accordingly.’

‘Do you mean to say that a judge would be justified in giving a decision which he knew to be contrary to the facts? Or that he might sentence a man whom he knew to be innocent?’

‘Certainly. It has been done. There is a case of a judge who sentenced a man to death and allowed the execution to take place, notwithstanding that he—the judge—had actually seen the murder committed by another man. But that was carrying correctness of procedure to the verge of pedantry.’

‘It was, with a vengeance,’ I agreed. ‘But to return to the case of John Bellingham. Supposing that after the Court has decided that he is dead he should return alive? What then?’

‘Ah! It would then be his turn to make an application, and the Court, having fresh evidence laid before it, would probably decide that he was alive.’

‘And meantime his property would have been dispersed?’

‘Probably. But you will observe that the presumption of death would have arisen out of his own proceedings. If a man acts in such a way as to create a belief that he is dead, he must put up with the consequences.’

‘Yes, that is reasonable enough,’ said I. And then, after a pause, I asked: ‘Is there any immediate likelihood of proceedings of the kind being commenced?’

‘I understood from what you said just now that Mr. Hurst was contemplating some action of the kind. No doubt you had your information from a reliable quarter.’ This answer Mr. Jellicoe delivered without moving a muscle, regarding me with the fixity of a spectated figurehead.

I smiled feebly. The operation of pumping Mr. Jellicoe was rather like the sport of boxing with a porcupine, being chiefly remarkable as a demonstration of the power of passive resistance. I determined, however, to make one more effort, rather, I think, for the pleasure of witnessing his defensive manoeuvres than with the expectation of getting anything out of him. I accordingly ‘opened out’ on the subject of the ‘remains.’

‘Have you been following these remarkable discoveries of human bones that have been appearing in the papers?’ I asked.

He looked at me stonily for some moments, and then replied:

‘Human bones are rather more within your province than mine, but, now that you mention it, I think I recall having read of some such discoveries. They were disconnected bones, I believe.’

‘Yes; evidently parts of a dismembered body.’

‘So I should suppose. No, I have not followed the accounts. As we get on in life our interests tend to settle into grooves, and my groove is chiefly connected with conveyancing. These discoveries would be of more interest to a criminal lawyer.’

‘I thought you might, perhaps, have connected them with the disappearance of your client?’

‘Why should I? What could be the nature of the connection?’

‘Well,’ I said, ‘these are the bones of a man—’

‘Yes; and my client was a man with bones. That is a connection, certainly, though not a very specific or distinctive one. But perhaps you had something more particular in your mind?’

‘I had,’ I replied. ‘The fact that some of the bones were actually found on land belonging to your client seemed to me rather significant.’

‘Did it, indeed?’ said Mr. Jellicoe. He reflected for a few moments, gazing steadily at me the while, and then continued: ‘In that I am unable to follow you. It would have seemed to me that the finding of human remains upon a certain piece of land might conceivably throw a prima fade suspicion upon the owner or occupant of the land as being the person who deposited them. But the case that you suggest is the one case in which this would be impossible. A man cannot deposit his own dismembered remains.’

‘No, of course not. I was not suggesting that he deposited them himself, but merely that the fact of their being deposited on his land, in a way, connected these remains with him.’
‘Again,’ said Mr. Jellicoe, ‘I fail to follow you, unless you are suggesting that it is customary for murderers who mutilate bodies to be punctilious in depositing the dismembered remains upon land belonging to their victims. In which case I am sceptical as to your facts. I am not aware of the existence of any such custom. Moreover, it appears that only a portion of the body was deposited on Mr. Bellingham’s land, the remaining portions having been scattered broadcast over a wide area. How does that agree with your suggestion?’

‘It doesn’t, of course,’ I admitted. ‘But there is another fact that I think you will admit to be more significant. The first remains that were discovered were found at Sidcup. Now, Sidcup is close to Eltham; and Eltham is the place where Mr. Bellingham was last seen alive.’

‘And what is the significance of this? Why do you connect the remains with one locality rather than the various other localities in which other portions of the body were found?’

Mr. Jellicoe shook his head. ‘You appear,’ said he, ‘to be confusing the order of deposition with the order of discovery. What evidence is there that the remains found at Sidcup were deposited before those found elsewhere?’

‘I don’t know that there is any,’ I admitted.

‘Then,’ said he, ‘I don’t see how you support your suggestion that the person started from the neighbourhood of Eltham.’

On consideration, I had to admit that I had nothing to offer in support of my theory; and having thus shot my last arrow in this very unequal contest, I thought it time to change the subject.

‘I called in at the British Museum the other day,’ said I, ‘and had a look at Mr. Bellingham’s last gift to the nation. The things are very well shown in that central case.’

‘Yes. I was very pleased with the position they have given to the exhibit, and so would my poor old friend have been. I wished, as I looked at the case, that he could have seen it. But perhaps he may, after all.’

‘I am sure I hope he will,’ said I, with more sincerity, perhaps, than the lawyer gave me credit for. For the return of John Bellingham would most effectually have cut the Gordian knot of my friend Godfrey’s difficulties. ‘You are a good deal interested in Egyptology yourself, aren’t you?’ I added.

‘Greatly interested,’ replied Mr. Jellicoe, with more animation than I had thought possible in his wooden face. ‘It is a fascinating subject, the study of this venerable civilisation, extending back to the childhood of the human race, preserved for ever for our instruction in its own unchanging monuments like a fly in a block of amber. Everything connected with Egypt is full of an impressive solemnity. A feeling of permanence, of stability, defying time and change, pervades it. The place, the people, and the monuments alike breathe of eternity.’

I was mightily surprised at this rhetorical outburst on the part of this dry, taciturn lawyer. But I liked him the better for the touch of enthusiasm that made him human, and determined to keep him astride of his hobby.

‘Yet,’ said I, ‘the people must have changed in the course of centuries.’

‘Yes, that is so. The people who fought against Cambyses were not the race who marched into Egypt five thousand years before—the dynastic people whose portraits we see on the early monuments. In those fifty centuries the blood of Hyksos and Syrians and Ethiopians and Hittites, and who can say how many more races, must have mingled with that of the old Egyptians. But still the national life went on without a break; the old culture leavened the new peoples, and the immigrant strangers ended by becoming Egyptians. It is a wonderful phenomenon. Looking back on it from our own time, it seems more like a geological period than the life history of a single nation. Are you at all interested in the subject?’

‘Yes, decidedly, though I am completely ignorant of it. The fact is that my interest is of quite recent growth. It is only of late that I have been sensible of the glamour of things Egyptian.’

‘Since you made Miss Bellingham’s acquaintance, perhaps?’ suggested Mr. Jellicoe, himself as unchanging in aspect as an Egyptian effigy.

I suppose I must have reddened—I certainly resented the remark—for he continued in the same even tone: ‘I made the suggestion because I know that she takes an intelligent interest in the subject and is, in fact, quite well informed on it.’

‘Yes; she seems to know a great deal about the antiquities of Egypt, and I may as well admit that your surmise was correct. It was she who showed me her uncle’s collection.’

‘So I had supposed,’ said Mr. Jellicoe. ‘And a very instructive collection it is, in a popular sense; very suitable for exhibition in a public museum, though there is nothing in it of unusual interest to the expert. The tomb furniture is excellent of its kind and the cartonnage case of the mummy is well made and rather finely decorated.’

‘Yes, I thought it quite handsome. But can you explain to me why, after taking all that trouble to decorate it, they should have disfigured it with those great smears of bitumen?’

‘Ah!’ said Mr. Jellicoe, ‘that is quite an interesting question. It is not unusual to find mummy cases smeared with bitumen; there is a mummy of a priestess in the next gallery which is completely coated with bitumen except the gilded face. Now, this bitumen was put on for a purpose—for the purpose of obliterating the inscriptions and thus concealing the
identity of the deceased from the robbers and desecrators of tombs. And there is the oddity of this mummy of Sebekhotep. Evidently there was an intention of obliterating the inscriptions. The whole of the back is covered thickly with bitumen, and so are the feet. Then the workers seem to have changed their minds and left the inscriptions and decoration untouched. Why they intended to cover it, and why, having commenced, they left it partially covered only, is a mystery. The mummy was found in its original tomb and quite undisturbed, so far as tomb-robbers are concerned. Poor Bellingham was greatly puzzled as to what the explanation could be.

'Speaking of bitumen,' said I, 'reminds me of a question that has occurred to me. You know that this substance has been used a good deal by modern painters and that it has a very dangerous peculiarity; I mean its tendency to liquefy, without any obvious reason, long after it has dried.'

'Yes, I know. Isn't there some story about a picture of Reynolds' in which bitumen had been used? A portrait of a lady, I think. The bitumen softened, and one of the lady's eyes slipped down on to her cheek; and they had to hang the portrait upside down and keep it warm until the eye slipped back again into its place. But what was your question?'

'I was wondering whether the bitumen used by the Egyptian artists has ever been known to soften after this great lapse of time.'

'Yes, I think it has. I have heard of instances in which the bitumen coatings have softened under certain circumstances and become quite “tacky”. But, bless my soul! here am I gossiping with you and wasting your time, and it is nearly a quarter to nine!'

My guest rose hastily, and I, with many apologies for having detained him, proceeded to fulfil my promise to guide him to his destination. As we sallied forth together the glamour of Egypt faded by degrees, and when he shook my hand stiffly at the gate of the Bellinghams' house, all his vivacity and enthusiasm had vanished, leaving the taciturn lawyer, dry, uncommunicative, and not a little suspicious.
THE 'Great Lexicographer'—tutelary deity of my adopted habitat—has handed down to shuddering posterity a definition of the act of eating which might have been framed by a dyspeptic ghoul, ‘Eat: to devour with the mouth.’ It is a shocking view to take of so genial a function; cynical, indecent, and finally unforgivable by reason of its very accuracy. For, after all, that is what eating amounts to, if one must needs express it with such crude brutality. But if the ingestion of alimentary substances—to ring a modern change upon the older formula—is in itself a process material even unto carnality, it is undeniable that it forms a highly agreeable accompaniment to more psychic manifestations.

And so, as the lamplight, reinforced by accessory candles, falls on the little first-floor room looking on Fetter Lane—only now the curtains are drawn—the conversation is not the less friendly and bright for a running accompaniment executed with knives and forks, for clink of goblet, and jovial gurgle of wine-flask. On the contrary, to one of us, at least—to wit, Godfrey Bellingham—the occasion is one of uncommon festivity, and his boyish enjoyment of the simple feast makes pathetic suggestions of hard times, faced uncomplainingly, but keenly felt nevertheless.

The talk flitted from topic to topic, mainly concerning itself with matters artistic, and never for one moment approaching the critical subject of John Bellingham’s will. From the stepped pyramid of Sakkarra with its encaustic tiles to mediaeval church floors; from Elizabethan woodwork to Mycenaean pottery, and thence to the industrial arts of the Stone age and the civilisation of the Aztecs, began to suspect that my two legal friends were so carried away by the interest of the conversation that they had forgotten the secret purpose of the meeting, for the dessert had been placed on the table (by Mrs. Gummer with the manner of a bereaved dependant dispensing funeral bakemeats), and still no reference had been made to the ‘case.’ But it seemed that Thorndyke was but playing a waiting game; was only allowing the intimacy to ripen while he watched for the opportunity. And that opportunity came, even as Mrs. Gummer vanished spectrally with a tray of plates and glasses.

‘So you had a visitor last night, Doctor;’ said Mr. Bellingham. ‘I mean my friend Jellicoe. He told us he had seen you, and mighty curious he was about you. I have never known Jellicoe to be so inquisitive before. What did you think of him?’

‘A quaint old cock. I found him highly amusing. We entertained one another for quite a long time with questions and crooked answers; I affecting eager curiosity, he replying with a defensive attitude of universal ignorance. It was a most diverting encounter.’

‘He needn’t have been so close,’ Miss Bellingham remarked, ‘seeing that all the world will be regaled with our affairs before long.’

‘They are proposing to take the case into Court, then?’ said Thorndyke.

‘Yes,’ said Mr. Bellingham. ‘Jellicoe came to tell me that my cousin, Hurst, has instructed his solicitors to make the application and to invite me to join him. Actually he came to deliver an ultimatum from Hurst—but I mustn’t disturb the harmony of this festive gathering with litigious discords.’

‘Now, why mustn’t you?’ asked Thorndyke. ‘Why is a subject in which we are all keenly interested to be taboo? You don’t mind telling us about it, do you?’

‘No, of course not. But what do you think of a man who buttonholes a doctor at a dinner-party to retail a list of ailments?’

‘It depends on what his ailments are,’ replied Thorndyke. ‘If he is a chronic dyspeptic and wishes to expound the virtues of Doctor Snaffer’s Purple Pills for Pimply People, he is merely a bore. But if he chances to suffer from some rare and choice disease, such as Trypanosomiasis or Acromegalmy, the doctor will be delighted to listen.’

‘Then are we to understand,’ Miss Bellingham asked, ‘that we are rare and choice products, in a legal sense?’

‘Undoubtedly,’ replied Thorndyke. ‘The case of John Bellingham is, in many respects, unique. It will be followed with the deepest interest by the profession at large, and especially by medical jurists.’

‘How gratifying that should be to us!’ said Miss Bellingham. ‘We may even attain undying fame in textbooks and treatises; and yet we are not so very much puffed up with our importance.’

‘No,’ said her father; ‘we could do without the fame quite well, and so, I think, could Hurst. Did Berkeley tell you of the proposal that he made?’

‘Yes,’ said Thorndyke; ‘and I gather from what you say that he has repeated it.’

‘Yes. He sent Jellicoe to give me another chance, and I was tempted to take it; but my daughter was strongly against any compromise, and probably she is right. At any rate, she is more concerned than I am.’

‘What view did Mr. Jellicoe take?’ Thorndyke asked.

‘Oh, he was very cautious and reserved, but he didn’t disguise his feeling that I should be wise to take a certainty in lieu of a very problematical fortune. He would certainly like me to agree, for he naturally wishes to get the affair settled and pocket his legacy.’

‘And have you definitely refused?’
'Yes; quite definitely. So Hurst will apply for permission to resume death and prove the will, and Jellicoe will support him; he says he has no choice.'

'And you?'

'I suppose I shall oppose the application, though I don’t quite know on what grounds.'

'Before you take definite steps,' said Thorndyke, 'you ought to give the matter very careful consideration. I take it that you have very little doubt that your brother is dead. And if he is dead, any benefit that you may receive under the will must be conditional on the previous presumption or proof of death. But perhaps you have taken advice?'

'No, I have not. As our friend the Doctor has probably told you, my means—or rather, the lack of them—do not admit of my getting professional advice. Hence my delicacy about discussing the case with you.'

'Then do you propose to conduct your case in person?'

'Yes; if it is necessary for me to appear in Court, as I suppose it will be, if I oppose the application.'

Thorndyke reflected for a few moments and then said gravely:

'You had much better not appear in person to conduct your case, Mr. Bellingham, for several reasons. To begin with, Mr. Hurst is sure to be represented by a capable counsel, and you will find yourself quite unable to meet the sudden exigencies of a contest in Court. You will be out-maneuvered. Then there is the judge to be considered.'

'But surely one can rely on the judge dealing fairly with a man who is unable to afford a solicitor and counsel?'

'Undoubtedly, as a rule, a judge will give an unrepresented litigant every assistance and consideration. English judges in general are high-minded men with a deep sense of their great responsibilities. But you cannot afford to take any chances. You must consider the exceptions. A judge has been a counsel, and he may carry to the bench some of the professional prejudices of the bar. Indeed, if you consider the absurd licence permitted to counsel in their treatment of witnesses, and the hostile attitude adopted by some judges towards medical and other scientific men who have to give their evidence, you will see that the judicial mind is not always quite as judicial as one would wish, especially when the privileges and immunities of the profession are concerned. Now, your appearance in person to conduct your case must unavoidably cause some inconvenience to the Court. Your ignorance of procedure and legal details must occasion some delay; and if the judge should happen to be an irritable man he might resent the inconvenience and delay. I don’t say that would affect his decision—I don’t think it would—but I am sure it would be wise to avoid giving offence to the judge. And, above all, it is most desirable to be able to detect and reply to any manoeuvres on the part of the opposing counsel, which you certainly would not be able to do.'

'This is excellent advice, Doctor Thorndyke,' said Bellingham, with a grim smile; 'but I’m afraid I shall have to take my chance.'

'Not necessarily,' said Thorndyke. 'I am going to make a little proposal, which I will ask you to consider without prejudice as a mutual accommodation. You see, your case is one of exceptional interest—it will become a textbook case, as Miss Bellingham prophesied; and, since it lies within my speciality, it will be necessary for me to follow it in the closest detail. Now, it would be much more satisfactory for me to study it from within than from without, to say nothing of the credit which would accrue to me if I should be able to conduct it to a successful issue. I am therefore going to ask you to put your case in my hands and let me see what can be done with it. I know this is an unusual course for a professional man to take, but I think it is not improper under the circumstances.'

Mr. Bellingham pondered in silence for a few moments, and then, after a glance at his daughter, began rather hesitatingly: 'It’s very generous of you, Doctor Thorndyke—'

'Pardon me,' interrupted Thorndyke, 'it is not. My motives, as I have explained, are purely egoistic.'

Mr. Bellingham laughed uneasily and again glanced at his daughter, who, however, pursued her occupation of peeling a pear with calm deliberation and without lifting her eyes. Getting no help from her he asked: 'Do you think that there is any possibility whatever of a successful issue?'

'Yes, a remote possibility—very remote, I fear, as things look at present; but if I thought the case absolutely hopeless I should advise you to stand aside and let events take their course.'

'Supposing the case should come to a favourable termination, would you allow me to settle your fees in the ordinary way?'

'If the choice lay with me,' replied Thorndyke, 'I should say “yes” with pleasure. But it does not. The attitude of the profession is very definitely unfavourable to “speculative” practice. You may remember the well-known firm of Dodson and Fogg, who gained thereby much profit, but little credit. But why discuss contingencies of this kind? If I bring your case to a successful issue I shall have done very well for myself. We shall have benefited one another mutually. Come now, Miss Bellingham, I appeal to you. We have eaten salt together, to say nothing of pigeon pie and other cakes. Won’t you back me up, and at the same time do a kindness to Doctor Berkeley?'

'Why, is Doctor Berkeley interested in our decision?'

'Certainly he is, as you will appreciate when I tell you that he actually tried to bribe me secretly out of his own pocket.'
‘Did you?’ she asked, looking at me with an expression that rather alarmed me.

‘Well, not exactly,’ I replied, mighty hot and uncomfortable, and wishing Thorndyke at the devil with his confidences. ‘I merely mentioned that the—the—solicitor’s costs, you know, and that sort of thing—but you needn’t jump on me, Miss Bellingham; Doctor Thorndyke did all that was necessary in that way.’

She continued to look at me thoughtfully as I stammered out my excuses, and then said: ‘I wasn’t going to. I was only thinking that poverty has its compensations. You are all so very good to us; and, for my part, I should accept Doctor Thorndyke’s generous offer most gratefully, and thank him for making it so easy for us.’

‘Very well, my dear,’ said Mr. Bellingham; ‘we will enjoy these sweets of poverty, as you say—we have sampled the other kind of thing pretty freely—and do ourselves the pleasure of accepting a | great kindness, most delicately offered.’

‘Thank you,’ said Thorndyke. ‘You have justified my faith in you, Miss Bellingham, and in the power of Dr. Berkeley’s salt. I understand that you place your affairs in my hands?’

‘Entirely and thankfully,’ replied Mr. Bellingham. ‘Whatever you think best to be done we agree to beforehand.’

‘Then,’ I said, ‘let us drink success to the cause. Port, if you please, Miss Bellingham; the vintage is not recorded, but it is quite wholesome, and a suitable medium for the sodium chloride of friendship.’ I filled her glass, and when the bottle had made its circuit, we stood up and solemnly pledged the new alliance.

There is just one thing I would say before we dismiss the subject for the present,” said Thorndyke. ‘It is a good thing to keep one’s own counsel. When you get formal notice from Mr. Hurst’s solicitors that proceedings are being commenced, you may refer them to Mr. Marchmont of Gray’s Inn, who will nominally act for you. He will actually have nothing to do, but we must preserve the fiction that I am instructed by a solicitor. Meanwhile, and until the case goes into Court, I think it very necessary that neither Mr. Jellicoe nor anyone else should know that I am connected with it. We must keep the other side in the dark, if we can.’

‘We will be as secret as the grave,’ said Mr. Bellingham; ‘and, as a matter of fact, it will be quite easy, since it happens, by a curious coincidence, that I am already acquainted with Mr. Marchmont. He acted for Stephen Blackmore, you remember, in that case that you unravelled so wonderfully well. I knew the Blackmores.’

‘Did you?’ said Thorndyke. ‘What a small world it is. And what a remarkable affair that was! The intricacies and cross-issues made it quite absorbingly interesting; and it is noteworthy for me in another respect, for it was one of the first cases in which I was associated with Doctor Jervis.’

‘Yes, and a mighty useful associate I was,’ remarked Jervis, ‘though I did pick up one or two facts by accident. And, by the way, the Blackmore case had certain points in common with your case, Mr. Bellingham. There was a disappearance and a disputed will, and the man who vanished was a scholar and an antiquarian.’

‘Cases in our speciality are apt to have certain general resemblances,’ Thorndyke said; and as he spoke he directed a keen glance at his junior, the significance of which I partly understood when he abruptly changed the subject.

‘The newspaper reports of your brother’s disappearance, Mr. Bellingham, were remarkably full of detail. There were even plans of your house and that of Mr. Hurst. Do you know who supplied the information?’

‘No, I don’t,’ replied Mr. Bellingham. ‘I know that I didn’t. Some newspaper men came to me for information, but I sent them packing. So, I understand, did Hurst; and as for Jellicoe, you might as well cross-examine an oyster.’

‘Well,’ said Thorndyke, ‘the pressmen have queer methods of getting “copy”; but still, some one must have given them that description of your brother and those plans. It would be interesting to know who it was. However, we don’t know; and now let us dismiss these legal topics, with suitable apologies for having introduced them.’

‘And perhaps,’ said I, ‘we may as well adjourn to what we call the drawing-room—it is really Barnard’s den—and leave the housekeeper to wrestle with the debris.’

We migrated to the cheerfully shabby little apartment, and, when Mrs. Gummer had served coffee, with gloomy resignation (as who should say: ‘If you will drink this sort of stuff I suppose you must, but don’t blame me for the consequences’), I settled Mr. Bellingham in Barnard’s favourite lop-sided easy chair—the depressed seat of which suggested its customary use by an elephant of sedentary habits—and opened the diminutive piano.

‘I wonder if Miss Bellingham would give us a little music?’ I said.

‘I wonder if she could?’ was the smiling response. ‘Do you know,’ she continued, ‘I have not touched a piano for nearly two years? It will be quite an interesting experiment—to me; but if it fails, you will be the sufferers. So you must choose.’

‘My verdict,’ said Mr. Bellingham, ‘is fiat experimentum, though I won’t complete the quotation, as that would seem to disparage Doctor Barnard’s piano. But before you begin, Ruth, there is one rather disagreeable matter that I want to dispose of, so that I may not disturb the harmony with it later.’

He paused and we all looked at him expectantly.

‘I suppose, Doctor Thorndyke,’ he said, ‘you read the newspapers?’

‘I don’t,’ replied Dr. Thorndyke. ‘But I ascertain, for purely business purposes, what they contain.’
‘Then,’ said Mr. Bellingham, ‘you have probably met with some accounts of the finding of certain human remains, apparently portions of a mutilated body.’

‘Yes, I have seen those reports and filed them for future reference.’

‘Exactly. Well, now, it can hardly be necessary for me to tell you that those remains—the mutilated remains of some poor murdered creature, as there can be no doubt they are—have seemed to have a very dreadful significance for me. You will understand what I mean; and I want to ask you if—if they have made a similar suggestion to you?’

Thorndyke paused before replying, with his eyes bent thoughtfully on the floor, and we all looked at him anxiously.

‘It’s very natural,’ he said at length, ‘that you should associate these remains with the mystery of your brother’s disappearance. I should like to say that you are wrong in doing so, but if I did I should be uncandid. There are certain facts that do, undoubtedly, seem to suggest a connection, and, up to the present, there are no definite facts of a contrary significance.’

Mr. Bellingham sighed deeply and shifted uncomfortably in his chair.

‘It is a horrible affair!’ he said huskily; ‘horrible! Would you mind, Doctor Thorndyke, telling us just how the matter stands in your opinion—what the probabilities are, for and against?’

Again Thorndyke reflected awhile, and it seemed to me that he was not very willing to discuss the subject. However, the question had been asked pointedly, and eventually he answered:

‘At the present stage of the investigation it is not very easy to state the balance of probabilities. The matter is still quite speculative. The bones which have been found hitherto (for we are dealing with a skeleton, not with a body) have been exclusively those which are useless for personal identification; which is, in itself, a rather curious and striking fact. The general character and dimension of the bones seem to suggest a middle-aged man of about your brother’s height, and the date of deposition appears to be in agreement with the date of his disappearance.’

‘Is it known, then, when they were deposited?’ asked Mr. Bellingham.

‘In the case of those found at Sidcup it seems possible to deduct an approximate date. The watercress-bed was cleaned out about two years ago, so they could not have been lying there longer than that; and their condition suggests that they could not have been there much less than two years, as there is apparently no vestige of the soft structures left. Of course, I am speaking from the newspaper reports only; I have no direct knowledge of the matter.’

‘Have they found any considerable part of the body yet? I haven’t been reading the papers myself. My little friend, Miss Oman, brought a great bundle of ’em for me to read, but I couldn’t stand it; I pitched the whole boiling of ’em out of the window.’

I thought I detected a slight twinkle in Thorndyke’s eye, but he answered quite gravely:

‘I think I can give you the particulars from memory, though I won’t guarantee the dates. The original discovery was made, apparently quite accidentally, at Sidcup on the fifteenth of July. It consisted of a complete left arm, minus the third finger and including the bones of the shoulder—the shoulder-blade and collar bone. This discovery seems to have set the local population, especially the juvenile part of it, searching all the ponds and streams of the neighbourhood—’

‘Cannibals!’ interjected Mr. Bellingham.

‘With the result that there was dredged up out of a pond near St Mary Cray, in Kent, a right thigh-bone. There is a slight clue to identity in respect of this bone, since the head of it has a small patch of “eburnation”—that is a sort of porcelain-like polish that occurs on the parts of bones that form a joint when the natural covering of cartilage is destroyed by disease. It is produced by the unprotected surface of the bone grinding against the similarly unprotected surface of another.’

‘And how,’ Mr. Bellingham asked, ‘would that help the identification?’

‘It would indicate,’ Thorndyke replied, ‘that the deceased had probably suffered from rheumatoid arthritis—what is commonly I known as rheumatic gout—and he would probably have limped! slightly and complained of some pain in the right hip.’

‘I’m afraid that doesn’t help us very much,’ said Mr. Bellingham; ‘for, you see, John had a pretty pronounced limp from another cause, an old injury to his left ankle; and as to complaining of pain—well, he was a hardy old fellow and not much given to making complaints of any kind. But don’t let me interrupt you.’

‘The next discovery,’ continued Thorndyke, ‘was made near Lee, by the police this time. They seem to have developed sudden activity in the matter, and in searching the neighbourhood of West Kent they dragged out of a pond near Lee the bones of a right foot. Now, if it had been the left instead of the right we might have a clue, as I understand your brother had fractured his left ankle, and there might have been some traces of the injury on the foot itself.’

‘Yes,’ said Mr. Bellingham. ‘I suppose there might. The injury was described as a Pott’s fracture.’

‘Exactly. Well, now, after this discovery at Lee it seems that the police set on foot a systematic search of all the ponds and small pieces of water around London, and, on the twenty-third, they found in the Cuckoo Pits in Epping Forest, not far from Woodford, the bones of a right arm (including those of the shoulder, as before), which seem to be part of the same body.’
'Yes,' said Mr. Bellingham, 'I heard of that. Quite close to my old house. Horrible! horrible! It gave me the shudders to think of it—to think that poor old John may have been waylaid and murdered when he was actually coming to see me. He may even have got into the grounds by the back gate, if it was left unfastened, and been followed in there and murdered. You remember that a scarab from his watch-chain was found there? But is it clear that this arm was the fellow of the arm that was found at Sidcup?'

'It seems to agree in character and dimensions,' said Thorndyke, 'and the agreement is strongly supported by a discovery made two days later.'

'What is that?' Mr. Bellingham demanded.

'It is the lower half of a trunk which the police dragged out of a rather deep pond on the skirts of the forest at Loughton—Staple's Pond, it is called. The bones found were the pelvis—that is, the two hip-bones—and six vertebrae, or joints of the backbone. Having discovered these, the police dammed the stream and pumped the pond dry, but no other bones were found; which is rather odd, as there should have been a pair of ribs belonging to the upper vertebra—the twelfth dorsal vertebra. It suggests some curious questions as to the method of dismemberment; but I mustn't go into unpleasant details. The point is that the cavity of the right hip-joint showed a patch of eburnation corresponding to that on the head of the right thigh-bone that was found at St Mary Cray. So there can be very little doubt that these bones are all part of the same body.'

'I see,' grunted Mr. Bellingham; and he added, after a moment's thought: 'Now, the question is, Are these bones the remains of my brother John? What do you say, Doctor Thorndyke?'

'I say that the question cannot be answered on the facts at present known to us. It can only be said that they may be, and that some of the circumstances suggest that they are. But we can only wait for further discoveries. At any moment the police may light upon some portion of the skeleton which will settle the question definitely one way or the other.'

'I suppose,' said Mr. Bellingham, 'I can't be of any service to you in the matter of identification?'

'Indeed you can,' said Thorndyke, 'and I was going to ask you to assist me. What I want you to do is this: Write down a full description of your brother, including every detail known to you, together with an account of every illness or injury from which you know him to have suffered; also the names and, if possible, the addresses of any doctors, surgeons, or dentists who may have attended him at any time. The dentists are particularly important, as their information would be invaluable if the skull belonging to these bones should be discovered.'

Mr. Bellingham shuddered.

'It's a shocking idea,' he said, 'but, of course you are right. You must have the facts if you are to form an opinion. I will write out what you want and send it to you without delay. And now, for God's sake, let us throw off this nightmare, for a little while, at least! What is there, Ruth, among Doctor Barnard's music that you can manage?'

Barnard's collection in general inclined to the severely classical, but we disinterred from the heap a few lighter works of an old-fashioned kind, including a volume of Mendelssohn's Lieder ohne Worte, and with one of these Miss Bellingham made trial of her skill, playing it with excellent taste and quite adequate execution. That, at least, was her father's verdict; for, as to me, I found it the perfection of happiness merely to sit and look at her—a state of mind that would have been in no wise disturbed even by 'Silvery Waves' or 'The Maiden's Prayer'.

Thus with simple, homely music, and conversation always cheerful and sometimes brilliant, slipped away one of the pleasantest evenings of my life, and slipped away all too soon. St Dunstan's clock was the fly in the ointment, for it boomed out intrusively the hour of eleven just as my guests were beginning to thoroughly appreciate one another, and thereby carried the sun (with a minor paternal satellite) out of the firmament of my heaven. For I had, in my professional capacity, given strict injunctions that Mr. Bellingham should on no account sit up late; and now, in my social capacity, I had smingly to hear 'the doctor's orders' quoted. It was a scurvy return for all my care.

When Mr. and Miss Bellingham departed, Thorndyke and Jervis would have gone too; but noting my bereaved condition, and being withal compassionate and tender of heart, they were persuaded to stay awhile and bear me company in a consolatory pipe.

XI.—THE EVIDENCE REVIEWED

'SO THE game has opened,' observed Thorndyke, as he struck a match. 'The play has begun with a cautious lead off by the other side. Very cautious and not very confident.'

'Why do you say "not very confident"?' I asked.

'Well, it is evident that Hurst—and, I fancy, Jellicoe too—is anxious to buy off Bellingham's opposition, and at a pretty long price, under the circumstances. And when we consider how very little Bellingham has to offer against the presumption of his brother's death, it looks as if Hurst hadn't much to say on his side.'

'No,' said Jervis, 'he can't hold many trumps or he wouldn't be willing to pay four hundred a year for his opponent's chances; and that is just as well, for it seems to me that our own hand is a pretty poor one.'
'We must look through our hand and see what we do hold,' said Thorndyke. ‘Our trump card at present—a rather small one, I'm afraid—is the obvious intention of the testator that the bulk of the property should go to his brother.’

'I suppose you will begin your inquiries now?' I said.

'We began them some time ago—the day after you brought us the will, in fact. Jervis had been through the registers and has ascertained that no interment under the name of John Bellingham has taken place since the disappearance; which was just what we expected. He has also discovered that some other person has been making similar inquiries; which, again, is what we expected.'

'And your own investigations?'

'Have given negative results for the most part. I found Doctor Norbury, at the British Museum, very friendly and helpful; so friendly, in fact, that I am thinking whether I may not be able to enlist his help in certain private researches of my own, with reference to the change effected by time in the physical properties of certain substances.'

'Oh; you haven’t told me about that,’ said Jervis.

'No; I haven’t really commenced to plan my experiments yet, and they will probably lead to nothing when I do. It occurred to me that, possibly, in the course of time, certain molecular changes might take place in substances such as wood, bone, pottery, stucco, and other common materials, and that these changes might alter their power of conducting or transmitting molecular vibrations. Now, if this should turn out to be the case, it would be a fact of considerable importance, medico-legally and otherwise; for it would be possible to determine approximately the age of any object of known composition by testing its reactions to electricity, heat, light and other molecular vibrations. I thought of seeking Doctor Norbury’s assistance because he can furnish me with materials for experiment of such great age that the reactions, if any, should be extremely easy to demonstrate. But to return to our case. I learned from him that John Bellingham had certain friends in Paris—collectors and museum officials—whom he was in the habit of visiting for the purpose of study and exchange of specimens. I have made inquiries of all these, and none of them had seen him during his last visit. In fact, I have not yet discovered anyone who had seen Bellingham in Paris on this occasion. So his visit there remains a mystery for the present.'

'It doesn’t seem to be of much importance, since he undoubtedly came back,' I remarked; but to this Thorndyke demurred.

'It is impossible to estimate the importance of the unknown,' said he.

'Well, how does the matter stand,' asked Jervis, 'on the evidence that we have? John Bellingham disappeared on a certain date. Is there anything to show what was the manner of his disappearance?'

'The facts in our possession,' said Thorndyke, 'which are mainly those set forth in the newspaper report, suggest several alternative possibilities; and in view of the coming inquiry—for they will, no doubt, have to be gone into in Court, to some extent—it may be worth while to consider them. There are five conceivable hypotheses’—here Thorndyke checked them on his fingers as he proceeded—'First, he may still be alive. Second, he may have died and been buried without identification. Third, he may have been murdered by some unknown person. Fourth, he may have been murdered by Hurst and his body concealed. Fifth, he may have been murdered by his brother. Let us examine these possibilities seriatim.'

'First, he may still be alive. If he is, he must either have disappeared voluntarily, have lost his memory suddenly and not been identified, or have been imprisoned—on a false charge or otherwise. Let us take the first case—that of voluntary disappearance. Obviously, its improbability is extreme.'

'Jellicoe doesn’t think so,’ said I. ‘He thinks it quite on the cards that John Bellingham is alive. He says that it is not a very unusual thing for a man to disappear for a time.’

'Then why is he applying for a presumption of death?'

'Just what I asked him. He says that it is the correct thing to do; that the entire responsibility rests on the Court.’

'That is all nonsense,’ said Thorndyke. ‘Jellicoe is the trustee for his absent client, and, if he thinks that client is alive, it is his duty to keep the estate intact; and he knows that perfectly well. We may take it that Jellicoe is of the same opinion as I am: that John Bellingham is dead.’

'Still,’ I urged, ‘men do disappear from time to time, and turn up again after years of absence.’

'Yes, but for a definite reason. Either they are irresponsible vagabonds who take this way of shuffling of their responsibilities, or they are men who have been caught in a net of distasteful circumstances. For instance, a civil servant or a solicitor or a tradesman finds himself bound for life to a locality and an occupation of intolerable monotony. Perhaps he has an ill-tempered wife, who after the amiable fashion of a certain type of woman, thinking that her husband is pinned down without a chance of escape, gives a free rein to her temper. The man puts up with it for years, but at last it becomes unbearable. Then he suddenly disappears; and small blame to him. But this was not Bellingham’s case. He was a wealthy bachelor with an engrossing interest in life, free to go whither he would and to do whatsoever he wished. Why should he disappear? The thing is incredible.'

'As to his having lost his memory and remained unidentified, that, also, is incredible in the case of a man who had visiting-cards and letters in his pocket, whose linen was marked, and who was being inquired for everywhere by the police.
As to his being in prison, we may dismiss that possibility, inasmuch as a prisoner, both before and after conviction, would have full opportunity of communicating with his friends.

'The second possibility, that he may have died suddenly and been buried without identification, is highly improbable; but, as it is conceivable that the body might have been robbed and the means of identification thus lost, it remains as a possibility that has to be considered, remote as it is.

'The third hypothesis, that he may have been murdered by some unknown person, is, under the circumstances, not wildly improbable; but, as the police were on the lookout and a detailed description of the missing man’s person was published in the papers, it would involve the complete concealment of the body. But this would exclude the most probable form of crime—the casual robbery with violence. It is therefore possible, but highly improbable.

'The fourth hypothesis is that Bellingham was murdered by Hurst. Now the one fact which militates against this view is that Hurst apparently had no motive for committing the murder. We are assured by Jellicoe that no one but himself knew the contents of the will, and if this is so—but mind, we have no evidence that it is so—Hurst would have no reason to suppose that he had anything material to gain by his cousin’s death. Otherwise the hypothesis presents no inherent improbabilities. The man was last seen alive at Hurst’s house. He was seen to enter it and he was never seen to leave it—we are still taking the facts as stated in the newspapers, remember—and it now appears that he stands to benefit enormously by that man’s death.’

‘But,’ I objected, ‘you are forgetting that, directly the man was missed Hurst and the servants together searched the entire house.’

‘Yes. What did they search for?’

‘Why, for Mr. Bellingham, of course.’

‘Exactly; for Mr. Bellingham. That is, for a living man. Now how do you search a house for a living man? You look in all the rooms. When you look in a room if he is there, you see him; if you do not see him, you assume that he is not there. You don’t look under the sofa or behind the piano, you don’t pull out large drawers or open cupboards. You just look into the rooms. That is what these people seem to have done. And they did not see Mr. Bellingham. Mr. Bellingham’s corpse might have been stowed away out of sight in any one of the rooms that they looked into.’

‘That is a grim thought,’ said Jervis; ‘but it is perfectly true. There is no evidence that the man was not lying dead in the house at the very time of the search.’

‘But even so,’ said I, ‘there was the body to be disposed of somehow. Now how could he possibly have got rid of the body without being observed?’

‘Ah!’ said Thorndyke, ‘now we are touching on a point of crucial importance. If anyone should ever write a treatise on the art of murder—not an exhibition of literary fireworks like De Quincey’s, but a genuine working treatise—he might leave all other technical details to take care of themselves if he could describe to me some really practicable plan for disposing of the body. That is, and always has been, the great stumbling-block to the murderer: to get rid of the body. The human body,’ he continued, thoughtfully regarding his pipe, just as, in the days of my pupillage, he was wont to regard the black-board chalk, ‘is a very remarkable object. It presents a combination of properties that makes it singularly difficult to conceal permanently. It is bulky and of an awkward shape, it is heavy, it is completely incombustible, it is chemically unstable, and its decomposition yields great volumes of highly odorous gases, and it nevertheless contains identifiable structures of the highest degree of permanence. It is extremely difficult to preserve unchanged, and it is still more difficult completely to destroy. The essential permanence of the human body is well known in the classical case of Eugene Aram; but a still more striking instance is that of Sekenen-Ra the Third, one of the last kings of the seventeenth Egyptian dynasty. Here, after a lapse of four thousand years, it has been possible to determine not only the cause of death and the manner of its occurrence, but the way in which the king fell, the nature of the weapon with which the fatal wound was inflicted, and even the position of the assailant. And the permanence of the body under other conditions is admirably shown in the case of Doctor Parkman, of Boston, USA, in which identification was actually effected by means of remains collected from the ashes of a furnace.’

‘Then we may take it,’ said Jervis, ‘that the world has not yet seen the last of John Bellingham.’

‘I think we may regard that as almost a certainty,’ replied Thorndyke. ‘The only question—and a very important one—is to when the reappearance may take place. It may be to-morrow or it may be centuries hence, when all the issues involved have been! forgotten.’

‘Assuming,’ said I, ‘for the sake of argument, that Hurst did murder him and that the body was concealed in the study at the time the search was made. How could it have been disposed of? If you had been in Hurst’s place, how would you have gone to work?’

Thorndyke smiled at the bluntness of my question.

‘You are asking me for an incriminating statement,’ said he, ‘delivered in the presence of a witness too. But, as a matter of fact, there is no use in speculating a priori, we should have to reconstruct a purely imaginary situation, the circumstances of which are unknown to us, and we should almost certainly reconstruct it wrong. What we may fairly assume is that no reasonable person, no matter how immoral, would find himself in the position that you suggest. Murder is usually a crime of impulse, and the murderer a person of feeble self-control. Such persons are most unlikely to make
elaborate and ingenious arrangements for the disposal of the bodies of their victims. Even the cold-blooded perpetrators of the most carefully planned murders appear as I have said, to break down at this point. The almost insuperable difficulty of getting rid of the human body is not appreciated until the murderer suddenly finds himself face to face with it.

‘In the case you are suggesting, the choice would seem to lie between burial on the premises or dismemberment and dispersal of the fragments; and either method would be pretty certain to lead to discovery.’

‘As illustrated by the remains of which you were speaking to Mr. Bellingham,’ Jervis remarked.

‘Exactly,’ Thorndyke answered, ‘though we could hardly imagine a reasonably intelligent criminal adopting a watercress-bed as a hiding place.’

‘No. That was certainly an error of judgment. By the way, I thought it best to say nothing while you were talking to Bellingham, but I noticed that, in discussing the possibility of those being the bones of his brother, you made no comment on the absence of the third ringer of the left hand. I am sure you didn’t overlook it, but isn’t it a point of some importance?’

‘As to identification? Under the present circumstances, I think not! If there were a man missing who had lost that finger it would, of course, be an important fact. But I have not heard of any such man. Or, again, if there were any evidence that the finger had been removed before death, it would be highly important. But there is no such evidence. It may have been cut off after death, and that is where the real significance of its absence lies.’

‘I don’t see quite what you mean,’ said Jervis.

‘I mean that, if there is no report of any missing man who had lost that particular finger, the probability is that the finger was removed after death. And then arises the interesting question of motive. Why should it have been removed? It could hardly have become detached accidentally. What do you suggest?’

‘Well,’ said Jervis, ‘it might have been a peculiar finger; a finger, for instance, with some characteristic deformity such as an ankylosed joint, which would be easy to identify.’

‘Yes; but that explanation introduces the same difficulty. No person with a deformed or ankylosed finger has been reported as missing.’

Jervis puckered up his brows, and looked at me.

‘I’m hanged if I see any other explanation,’ he said. ‘Do you, Berkeley?’

I shook my head.

‘Don’t forget which finger it is that is missing,’ said Thorndyke. ‘The third finger of the left hand.’

‘Oh, I see!’ said Jervis. ‘The ring-finger. You mean that it may have been removed for the sake of a ring that wouldn’t come off.’

‘Yes. It would not be the first instance of the kind. Fingers have been severed from dead hands—and even from living ones—for the sake of rings that were too tight to be drawn off. And the fact that it is the left hand supports the suggestion; for a ring that was inconveniently tight would be worn by preference on the left hand, as that is usually slightly smaller than the right. What is the matter, Berkeley?’

A sudden light had burst upon me, and I suppose my countenance betrayed the fact.

‘I am a confounded fool!’ I exclaimed.

‘Oh, don’t say that,’ said Jervis. ‘Give your friends a chance.’

‘I ought to have seen this long ago and told you about it. John Bellingham did wear a ring, and it was so tight that, when once he had got it on, he could never get it off again.’

‘Do you happen to know on which hand he wore it?’ Thorndyke asked.

‘Yes. It was on the left hand; because Miss Bellingham, who told me about it, said that he would never have been able to get the ring on at all but for the fact this his left hand was slightly smaller than his right.’

‘There it is, then,’ said Thorndyke. ‘With this new fact in our possession, the absence of the finger furnishes the starting-point of some very curious speculations.’

‘As, for instance,’ said Jervis.

‘Ah, under the circumstances, I must leave you to pursue those speculations independently. I am now acting for Mr. Bellingham.’

Jervis grinned and was silent for a while, refilling his pipe thoughtfully; but when he had got it alight he resumed.

‘To return to the question of the disappearance; you don’t consider it highly improbable that Bellingham might have been murdered by Hurst?’

‘Oh, don’t imagine I am making an accusation. I am considering the various probabilities merely in the abstract. The same reasoning applies to the Bellinghams. As to whether any of them did commit the murder, that is a question of personal character. I certainly do not suspect the Bellinghams after having seen them, and with regard to Hurst, I know nothing, or at least very little, to his disadvantage.’
‘Well,’ Thorndyke said, with some hesitation, ‘it seems a thought unkind to rake up the little details of a man’s past, and yet it has to be done. I have, of course, made the usual routine inquiries concerning the parties to this affair, and this is what they have brought to light:

‘Hurst, as you know, is a stockbroker—a man of good position and reputation; but, about ten years ago, he seems to have committed an indiscretion, to put it mildly, which nearly got him into rather serious difficulties. He appears to have speculated rather heavily and considerably beyond his means, for when a sudden spasm of the markets upset his calculations, it turned out that he had been employing his clients’ capital and securities. For a time it looked as if there was going to be serious trouble; then, quite unexpectedly, he managed to raise the necessary amount in some way and settle all claims. Whence he got the money has never been discovered to this day, which is a curious circumstance, seeing that the deficiency was rather over five thousand pounds; but the important fact is that he did get it and that he paid up all that he owed. So that he was only a potential defaulter, so to speak; and discreditable as the affair undoubtedly was, it does not seem to have any direct bearing on this present case.’

‘No,’ Jervis agreed, ‘though it makes one consider his position with more attention than one would otherwise.’

‘Undoubtedly,’ said Thorndyke. ‘A reckless gambler is a man whose conduct cannot be relied on. He is subject to vicissitudes of fortune which may force him into other kinds of wrong doing. Many an embezzlement has been preceded by an unlucky plunge on the turf.’

‘Assuming the responsibility for this disappearance to lie between Hurst and—and the Bellinghams,’ said I, with an uncomfortable gulp as I mentioned the names of my friends, ‘to which side does the balance of probability incline?’

‘To the side of Hurst, I should say, without doubt,’ replied Thorndyke. ‘The case stands thus—on the facts presented to us: Hurst appears to have had no motive for killing the deceased (as we will call him); but the man was seen to enter the house, was never seen to leave it, and was never again seen alive. Bellingham, on the other hand, had a motive, as he had believed himself to be the principal beneficiary under the will. But the deceased was not seen at his house, and there is no evidence that he went to the house or to the neighbourhood, excepting the scarab that was found there. But the evidence of the scarab is vitiated by the fact that Hurst was present when it was picked up, and that it was found on a spot over which Hurst had passed only a few minutes previously. Until Hurst is cleared, it seems to me that the presence of the scarab proves nothing against the Bellinghams.’

‘Then your opinions on the case,’ said I, ‘are based entirely on the facts that have been made public.’

‘Yes, mainly. I do not necessarily accept those facts just as they are presented, and I may have certain views of my own on the case. But if I have, I do not feel in a position to discuss them. For the present, discussion has to be limited to the facts and inferences offered by the parties concerned.’

‘There!’ exclaimed Jervis, rising to knock his pipe out, ‘that is where Thorndyke has you. He lets you think you’re in the thick of the “know” until one fine morning you wake up and discover that you have only been a gaping outsider; and then you are mightily astonished—and so are the other side, too, for that matter. But we must really be off now, mustn’t we, reverend senior?’

‘I suppose we must,’ replied Thorndyke; and, as he drew on his gloves, he asked: ‘Have you heard from Barnard lately?’

‘Oh, yes,’ I answered. ‘I wrote to him at Smyrna to say that the practice was flourishing and that I was quite happy and contented, and that he might stay away as long as he liked. He writes by return that he will prolong his holiday if an opportunity offers, but will let me know later.’

‘Gad,’ said Jervis, ‘it was a stroke of luck for Barnard that Bellingham happened to have such a magnificent daughter—there! don’t mind me, old man. You go in and win—she’s worth it, isn’t she, Thorndyke?’

‘Miss Bellingham’s a very charming young lady,’ replied Thorndyke. ‘I am most favourably impressed by both the father and the daughter, and I only trust that we may be able to be of some service to them.’ With this sedate little speech Thorndyke shook my hand, and I watched my two friends go on their way until their fading shapes were swallowed up in the darkness of Fetter Lane.

XII. — A VOYAGE OF DISCOVERY

It was two or three mornings after my little supper party that, as I stood in the consulting-room brushing my hat preparatory to starting on my morning round, Adolphus appeared at the door to announce two gentlemen waiting in the surgery. I told him to bring them in, and a moment later Thorndyke entered, accompanied by Jervis. I noted that they looked uncommonly large in that little apartment, especially Thorndyke, but I had no time to consider this phenomenon, for the latter, when he had shaken my hand, proceeded at once to explain the object of their visit.

‘We have come to ask a favour, Berkeley,’ he said; ‘to ask you to do us a very great service in the interests of your friends the Bellinghams.’

‘You know I shall be delighted,’ I said warmly. ‘What is it?’

‘I will explain. You know—or perhaps you don’t—that the police have collected all the bones that have been discovered and deposited them in the mortuary at Woodford, where they are to be viewed by the coroner’s jury. Now, it has become
imperative that I should have more definite and reliable information than I can get from the newspapers. The natural thing for me would be to go down and examine them myself, but there are circumstances that make it very desirable that my connection with the case should not leak out. Consequently, I can’t go myself, and, for the same reason, I can’t send Jervis. On the other hand, as it is now stated pretty openly that the police consider the bones to be almost certainly those of John Bellingham, it would seem perfectly natural that you, as Godfrey Bellingham’s doctor, should go down to view them on his behalf.

‘I should like to,’ I said. ‘I would give anything to go; but how is it to be managed? It would mean a whole day off and leaving the practice to look after itself.’

‘I think it could be managed,’ said Thorndyke; ‘and the matter is really important for two reasons. One is that the inquest opens tomorrow, and someone certainly ought to be there to watch the proceedings on Godfrey’s behalf; and the other is that our client has received notice from Hurst’s solicitors that the application will be heard in the Probate Court in a few days.’

‘Isn’t that rather sudden?’ I asked.

‘It certainly suggests that there has been a good deal more activity than we were given to understand. But you see the importance of the affair. The inquest will be a sort of dress rehearsal for the Probate Court, and it is quite essential that we should have a chance of estimating the management.’

‘Yes, I see that. But how are we to manage about the practice?’

‘We shall find you a substitute.’

‘Through a medical agent?’

‘Yes,’ said Jervis. ‘Percival will find us a man; in fact, he has done it. I saw him this morning; he has a man who is waiting up in town to negotiate for the purchase of a practice and who would do the job for a couple of guineas. Quite a reliable man. Only say the word, and I will run off to Adam Street and engage him definitely.’

‘Very well. You engage the locum tenens, and I will be prepared to start for Woodford as soon as he turns up.’

‘Excellent!’ said Thorndyke. ‘That is a great weight off my mind. And if you could manage to drop in this evening and smoke a pipe with us we could talk over the plan of campaign and let you know what items of information we are particularly in want of.’

I promised to turn up at King’s Bench Walk as soon after half-past eight as possible, and my two friends then took their departure, leaving me to set out in high spirits on my scanty round of visits.

It is surprising what different aspects things present from different points of view; how relative are our estimates of the conditions and circumstances of life. To the urban workman—the journeyman baker or tailor, for instance, labouring year in year out in a single building—a holiday ramble on Hampstead Heath is a veritable voyage of discovery; whereas to the sailor the shifting panorama of the whole wide world is but the commonplace of the day’s work.

So I reflected as I took my place in the train at Liverpool Street on the following day. There had been a time when a trip by rail to the borders of Epping Forest would have been far from a thrilling experience; now, after vegetating in the little world of Fetter Lane, it was quite an adventure.

The enforced inactivity of a railway journey is favourable to thought, and I had much to think about. The last few weeks had witnessed momentous changes in my outlook. New interests had arisen, new friendships had grown up, and above all, there had stolen into my life that supreme influence that, for good or for evil, according to my fortune, was to colour and pervade it even to its close. Those few days of companionable labour in the reading-room, with the homely hospitalities of the milk-shop and the pleasant walks homeward through the friendly London streets, had called into existence a new world—a world in which the gracious personality of Ruth Bellingham was the one dominating reality. And thus, as I leaned back in the corner of the railway carriage with an unlighted pipe in my hand, the events of the immediate past, together with those more problematical ones of the impending future, occupied me rather to the exclusion of the business of the moment, which was to review the remains collected in the Woodford mortuary, until, as the train approached Stratford, the odours of the soap and bone-manure factories poured in at the open window and (by a natural association of ideas) brought me back to the object of my quest.

As to the exact purpose of this expedition, I was not very clear; but I knew that I was acting as Thorndyke’s proxy and thrilled with pride at the thought. But what particular light my investigations were to throw upon the intricate Bellingham case I had no very definite idea. With a view to fixing the procedure in my mind, I took Thorndyke’s written instructions from my pocket and read them over carefully. They were very full and explicit, making ample allowance for my lack of experience in medico-legal matters:

1. Do not appear to make minute investigations or in any way excite remark.
2. Ascertain if all the bones belonging to each region are present, and if not, which are missing.
3. Measure the extreme length of the principal bones and compare those of opposite sides.
4. Examine the bones with reference to age, sex, and muscular development of the deceased.
‘5. Note the presence or absence of signs of constitutional disease, local disease of bone or adjacent structures, old or recent injuries, and any other departures from the normal or usual.

‘6. Observe the presence or absence of adipocere and its position, if present.

‘7. Note any remains of tendons, ligaments, or other soft structures.

‘8. Examine the Sidcup hand with reference to the question as to whether the finger was separated before or after death.

‘9. Estimate the probable period of submersion and note any changes (as e.g., mineral or organic staining) due to the character of the water or mud.

‘10. Ascertain the circumstances (immediate and remote) that led to the discovery of the bones and the names of the persons concerned in those circumstances.

‘11. Commit all information to writing as soon as possible, and make plans and diagrams on the spot, if circumstances permit.

‘12. Preserve an impassive exterior: listen attentively but without eagerness; ask as few questions as possible; pursue any inquiry that your observations on the spot may suggest.’

These were my instructions, and, considering that I was going merely to inspect a few dry bones, they appeared rather formidable; in fact, the more I read them over the greater became my misgivings as to my qualifications for the task.

As I approached the mortuary it became evident that some, at least, of Thorndyke’s admonitions were by no means unnecessary. The place was in charge of a police sergeant, who watched my approach suspiciously; and some half-dozen men, obviously newspaper reporters, hovered about the entrance like a pack of jackals. I presented the coroner’s order which Mr. Marchmont had obtained, and which the sergeant read with his back against the wall, to prevent the newspaper men from looking over his shoulder.

My credentials being found satisfactory, the door was unlocked and I entered, accompanied by three enterprising reporters, whom, however, the sergeant summarily ejected and locked out, returning to usher me into the presence and to observe my proceedings with intelligent but highly embarrassing interest.

The bones were laid out on a large table and covered with a sheet, which the sergeant slowly turned back, watching my face intently as he did so to note the impression that the spectacle made upon me. I imagine that he must have been somewhat disappointed by my impassive demeanour, for the remains suggested to me nothing more than a rather shabby set of ‘student’s osteology.’ The whole collection had been set out by the police surgeon (as the sergeant informed me) in their proper anatomical order; notwithstanding which I counted them over carefully to make sure that none were missing, checking them by the list which Thorndyke had furnished me.

‘I see you have found the left thigh-bone,’ I remarked, observing that this did not appear in the list.

‘Yes,’ said the sergeant; ‘that turned up yesterday evening in a big pond called Baldwin’s Pond in the Sandpit plain, near Little Monk Wood.’

‘Is that near here?’ I asked.

‘In the forest up Loughton way,’ was the reply.

I made a note of the fact (on which the sergeant looked as if he was sorry he had mentioned it), and then turned my attention to a general consideration of the bones before examining them in detail. Their appearance would have been improved and examination facilitated by a thorough scrubbing, for they were just as they had been taken from their respective resting-places, and it was difficult to decide whether their reddish-yellow colour was an actual stain or due to a deposit on the surface. In any case, as it affected them all alike, I thought it an interesting feature and made a note of it. They bore numerous traces of their sojourn in the various ponds from which they had been recovered, but these gave me little help in determining the length of time during which they had been submerged. They were, of course, encrusted with mud, and little wisps of pond-weed stuck to them in places; but these facts furnished only the vaguest measure of time.

Some of the traces were, indeed, more informing. To several of the bones, for instance, there adhered the dried egg-clusters of the common pond-snail, and in one of the hollows of the right shoulder-blade (the ‘infra-spinous fossa’) was a group of the mud-built tubes of the red river-worm. These remains gave proof of a considerable period of submersion, and since they could not have been deposited on the bones until all the flesh had disappeared they furnished evidence that some time—a month or two, at any rate—had elapsed since this had happened. Incidentally, too, their distribution showed the position in which the bones had lain, and though this appeared to be of no importance in the existing circumstances, I made careful notes of the situation of each adherent body, illustrating their position by rough sketches.

The sergeant watched my proceedings with an indulgent smile.

‘You’re making a regular inventory, sir,’ he remarked, ‘as if you were going to put ‘em up for auction. I shouldn’t think those snails’ eggs would be much help in identification. And all that has been done already,’ he added as I produced my measuring-tape.

‘No doubt,’ I replied; ‘but my business is to make independent observations, to check the others, if necessary.’ And I proceeded to measure each of the principal bones separately and to compare those of the opposite sides. The agreement in
dimensions and general characteristics of the pairs of bones left little doubt that all were parts of one skeleton, a conclusion that was confirmed by the eburnated patch on the head of the right thigh-bone and the corresponding patch in the socket of the right hip-bone. When I had finished my measurements I went over the entire series of bones in detail, examining each with the closest attention for any of those signs which Thorndyke had indicated, and eliciting nothing but a monotonously reiterated negative. They were distressingly and disappointingly normal.

'Well, sir, what do you make of 'em?' the sergeant asked cheerfully as I shut up my notebook and straightened my back. 'Whose bones are they? Are they Mr. Bellingham's, think ye?'

'I should be very sorry to say whose bones they are,' I replied. 'One bone is very much like another, you know.'

'I suppose it is,' he agreed; 'but I thought that, with all that measuring and all those notes, you might have arrived at something definite.' Evidently he was disappointed in me; and I was somewhat disappointed in myself when I contrasted Thorndyke's elaborate instructions with the meagre result of my investigations. For what did my discoveries amount to? And how much was the inquiry advanced by the few entries in my notebook?

The bones were apparently those of a man of fair though not remarkable muscular development; over thirty years of age, but how much older I was unable to say. His height I judged roughly to be five feet eight inches, but my measurements would furnish data for a more exact estimate by Thorndyke. Beyond this the bones were quite uncharacteristic. There were no signs of diseases either local or general, no indications of injuries either old or recent, no departures of any kind from the normal or usual; and the dismemberment had been effected with such care that there was not a single scratch on any of the separated surfaces. Of adipocere (the peculiar waxy or soapy substance that is commonly found in bodies that have slowly decayed in damp situations) there was not a trace; and the only remnant of the soft structures was a faint indication, like a spot of dried glue, of the tendon on the tip of the right elbow.

The sergeant was in the act of replacing the sheet, with the air of a showman who has just given an exhibition, when there came a sharp rapping on the mortuary door. The officer finished spreading the sheet with official precision, and having ushered me out into the lobby, turned the key and admitted three persons, holding the door open after they had entered for me to go out. But the appearance of the new-comers inclined me to linger. One of them was a local constable, evidently in official charge; a second was a labouring man, very wet and muddy, who carried a small sack; while in the third I thought I scented a professional brother.

The sergeant continued to hold the door open.

'Nothing more I can do for you, sir?' he asked genially.

'Is that the divisional surgeon?' I inquired.

'Yes. I am the divisional surgeon,' the new-comer answered. 'Did you want anything of me?'

'This,' said the sergeant, 'is a medical gentleman who has got permission from the coroner to inspect the remains. He is acting for the family of the deceased—I mean, for the family of Mr. Bellingham,' he added in answer to an inquiring glance from the surgeon.

'I see,' said the latter. 'Well, they have found the rest of the trunk, including, I understand, the ribs that were missing from the other part. Isn't that so, Davis?'

'Yes, sir,' replied the constable. 'Inspector Badger says all the ribs are here, and all the bones of the neck as well.'

'The inspector seems to be an anatomist,' I remarked.

The sergeant grinned. 'He is a very knowing gentleman, is Mr. Badger. He came down here this morning quite early and spent a long time looking over the bones and checking them by some notes in his pocket-book. I fancy he's got something on, but he was precious close about it.'

Here the sergeant shut up rather suddenly—perhaps contrasting his own conduct with that of his superior.

'Let us have these new bones out on the table,' said the police surgeon. 'Take the sheet off, and don't shoot them out as if they were coals. Hand them out carefully.'

The labourer fished out the wet and muddy bones one by one from the sack, and as he laid them on the table the surgeon arranged them in their proper relative positions.

'This has been a neatly executed job,' he remarked; 'none of your clumsy hacking with a chopper or a saw. The bones have been cleanly separated at the joints. The fellow who did this must have had some anatomical knowledge, unless he was a butcher, which, by the way, is not impossible. He has used his knife uncommonly skilfully, and you notice that each arm was taken off with the scapula attached, just as a butcher takes off a shoulder of mutton. Are there any more bones in that bag?'

'No, sir,' replied the labourer, wiping his hands with an air of finality on the posterior aspect of his trousers; 'that's the lot.'

The surgeon looked thoughtfully at the bones as he gave a final touch to their arrangement, and remarked:

'The inspector is right. All the bones of the neck are there. Very odd. Don't you think so?'

'You mean—'
‘I mean that this very eccentric murderer seems to have given himself such an extraordinary amount of trouble for no reason that one can see. There are these neck vertebrae, for instance. He must have carefully separated the skull from the atlas instead of just cutting through the neck. Then there is the way he divided the trunk; the twelfth ribs have just come in with this lot, but the twelfth dorsal vertebra to which they belong was attached to the lower half. Imagine the trouble he must have taken to do that, and without cutting or hacking the bones about, either. It is extraordinary. This is rather interesting, by the way. Handle it carefully.’

He picked up the breast-bone daintily—for it was covered with wet mud—and handed it to me with the remark:

‘That is the most definite piece of evidence we have.’

‘You mean,’ I said, ‘that the union of the two parts into a single mass fixes this as the skeleton of an elderly man?’

‘Yes, that is the obvious suggestion, which is confirmed by the deposit of bone in the rib-cartilages. You can tell the inspector, Davis, that I have checked this lot of bones and that they are all here.’

‘Would you mind writing it down, sir?’ said the constable. ‘Inspector Badger said I was to have everything in writing.’

The surgeon took out his pocket-book, and, while he was selecting a suitable piece of paper, he asked: ‘Did you form any opinion as to the height of the deceased?’

‘Yes, I thought he would be about five feet eight’ (here I caught the sergeant’s eyes, fixed on me with a knowing leer).

‘I made it five and a half,’ said the police surgeon; ‘but we shall know better when we have seen the lower leg-bones. Where was this lot found, Davis?’

‘In the pond just off the road in Lord’s Bushes, sir, and the inspector has gone off now to—’

‘Never mind where he’s gone,’ interrupted the sergeant. ‘You just answer questions and attend to your business.’

The sergeant’s reproof conveyed a hint to me on which I was not slow to act. Friendly as my professional colleague was, it was clear that the police were disposed to treat me as an interloper who was to be kept out of the ‘know’ as far as possible. Accordingly I thanked my colleague and the sergeant for their courtesy, and bidding them adieu until we should meet at the inquest, took my departure and walked away quickly until I found an inconspicuous position from which I could keep the door of the mortuary in view. A few moments later I saw Constable Davis emerge and stride away up the road.

I watched his rapidly diminishing figure until he had gone as far as I considered desirable, and then I set forth in his wake. The road led straight away from the village, and in less than half a mile entered the outskirts of the forest. Here I quickened my pace to close up somewhat, and it was well that I did so, for suddenly he diverged from the road into a green lane, where for a while I lost sight of him. Still hurrying forward, I again caught sight of him just as he turned off into a narrow path that entered a beech wood with a thickish undergrowth of holly, along which I followed him for several minutes, gradually decreasing the distance between us, until suddenly there fell on my ear a rhythmical sound like the clank of a pump. Soon after I caught the sound of men’s voices, and then the constable struck off the path into the wood.

I now advanced more cautiously, endeavouring to locate the search party by the sound of the pump, and when I had done this I made a little detour so that I might approach from the opposite direction to that from which the constable had appeared.

Still guided by the noise of the pump, I at length came out into a small opening among the trees and halted to survey the scene. The centre of the opening was occupied by a small pond, not more than a dozen yards across, by the side of which stood a builder’s handcart. The little two-wheeled vehicle had evidently been used to convey the appliances which were deposited on the ground near it, and which consisted of a large tub—now filled with water—a shovel, a rake, a sieve, and a portable pump, the latter being fitted with a long delivery hose. There were three men besides the constable, one of whom was working the handle of the pump, while another was glancing at a paper that the constable had just delivered to him. He looked up sharply as I appeared, and viewed me with unconcealed disfavour.

‘Hallo, sir!’ said he. ‘You can’t come here.’

Now, seeing that I was actually here, this was clearly a mistake, and I ventured to point out the fallacy.

‘Well, I can’t allow you to stay here. Our business is of a private nature.’

‘I know exactly what your business is, Inspector Badger.’

‘Oh, do you?’ said he, surveying me with a foxy smile. ‘And I expect I know what yours is, too. But we can’t have any of you newspaper gentry spying on us just at present, so you just be off.’

I thought it best to undeceive him at once, and accordingly, having explained who I was, I showed him the coroner’s permit, which he read with manifest annoyance.

‘This is all very well, sir,’ said he as he handed me back the paper, ‘but it doesn’t authorise you to come spying on the proceedings of the police. Any remains that we discover will be deposited in the mortuary, where you can inspect them to your heart’s content; but you can’t stay here and watch us.’

I had no defined object in keeping a watch on the inspector’s proceedings; but the sergeant’s indiscreet hint had aroused my curiosity, which was further excited by Mr. Badger’s evident desire to get rid of me. Moreover, while we had been
talking, the pump had stopped (the muddy floor of the pond being now pretty fully exposed), and the inspector's assistant was handling the shovel impatiently.

'Now I put it to you, Inspector,' said I, persuasively, 'is it politic of you to allow it to be said that you refused an authorised representative of the family facilities for verifying any statements that you may make hereafter?'

'What do you mean?' he asked.

'I mean that if you should happen to find some bone which could be identified as part of the body of Mr. Bellingham, that fact would be of more importance to his family than to anyone else. You know that there is a very valuable estate and a rather difficult will.'

'I didn't know it, and I don't see the bearing of it now' (neither did I for that matter); 'but if you make such a point of being present at the search, I can't very well refuse. Only you mustn't get in our way, that's all.'

On hearing this conclusion, his assistant, who looked like a plain-clothes officer, took up his shovel and stepped into the mud that formed the bottom of the pond, stooping as he went and peering among the masses of weed that had been left stranded by the withdrawal of the water. The inspector watched him anxiously, cautioning him from time to time to 'look out where he was treading'; the labourer left the pump and craned forward from the margin of the mud, and the constable and I looked on from our respective points of vantage. For some time the search was fruitless. Once the searcher stooped and picked up what turned out to be a fragment of decayed wood; then the remains of a long-deceased jay were discovered, examined, and rejected. Suddenly the man bent down by the side of a small pool that had been left in one of the deeper hollows, stared intently into the mud, and stood up.

'There's something here that looks like a bone, sir,' he sang out.

'Don't grub about then,' said the inspector. 'Drive your shovel right into the mud where you saw it and bring it to the sieve.'

The man followed out these instructions, and as he came shore-wards with a great pile of the slimy mud on his shovel we all converged on the sieve, which the inspector took up and held over the tub, directing the constable and labourer to 'lend a hand,' meaning thereby that they were to crowd round the tub and exclude me as completely as possible. This, in fact, they did very effectively with his assistance, for, when the shovelful of mud had been deposited on the sieve, the four men leaned over it and so nearly hid it from view that it was only by craning over, first on one side and then on the other, that I was able to catch an occasional glimpse of it and to observe it gradually melting away as the sieve, immersed in the water, was shaken to and fro.

Presently the inspector raised the sieve from the water and stooped over it more closely to examine its contents. Apparently the examination yielded no very conclusive results, for it was accompanied by a series of rather dubious grunts.

At length the officer stood up, and turning to me with a genial but foxy smile, held out the sieve for my inspection.

'Like to see what we have found, Doctor?' said he.

I thanked him and stood over the sieve. It contained the sort of litter of twigs, skeleton leaves, weed, pond-snails, dead shells, and fresh-water mussels that one would expect to strain out from the mud of an ancient pond; but in addition to these there were three small bones which at first glance gave me quite a start until I saw what they were.

The inspector looked at me inquiringly. 'H'm?' said he.

'Yes,' I replied. 'Very interesting.'

'Those will be human bones, I fancy; h'm?'

'I should say so, undoubtedly,' I answered.

'Now,' said the inspector, 'could you say, off-hand, which finger those bones belong to?'

I smothered a grin (for I had been expecting this question), and answered:

'I can say off-hand that they don't belong to any finger. They are the bones of the left great toe.'

The inspector's jaw dropped.

'The deuce they are!' he muttered. 'H'm. I thought they looked a bit stout.'

'I expect,' said I, 'that if you go through the mud close to where this came from you'll find the rest of the foot.'

The plain-clothes man proceeded at once to act on my suggestion, taking the sieve with him to save time. And sure enough, after filling it twice with the mud from the bottom of the pool, the entire skeleton of the foot was brought to light.

'Now you're happy, I suppose;' said the inspector when I had checked the bones and found them all present.

'I should be more happy,' I replied, 'if I knew what you were searching for in this pond. You weren't looking for the foot, were you?'

'I was looking for anything that I might find;' he answered. 'I shall go on searching until we have the whole body. I shall go through all the streams and ponds around here, excepting Con-naught Water. That I shall leave to the last, as it will be a case of dredging from a boat and isn't so likely as the smaller ponds. Perhaps the head will be there; it's deeper than any of
the others.’

It now occurred to me that as I had learned all that I was likely to learn, which was little enough, I might as well leave the inspector to pursue his searches unembarrassed by my presence. Accordingly I thanked him for his assistance and departed by the way I had come.

But as I retraced my steps along the shady path I speculated profoundly on the officer’s proceedings. My examinations of the mutilated hand had yielded the conclusion that the finger had been removed after death or shortly before, but more probably after. Some one else had evidently arrived at the same conclusion, and had communicated his opinion to Inspector Badger; for it was clear that that gentleman was in full cry after the missing finger. But why was he searching for it here when the hand had been found at Sidcup? And what did he expect to learn from it when he found it? There is nothing particularly characteristic about a finger, or, at least, the bones of one; and the object of the present researches was to determine the identity of the person of whom these bones were the remains. There was something mysterious about the affair, something suggesting that Inspector Badger was in possession of private information of some kind. But what information could he have? And whence could he have obtained it? These were questions to which I could find no answer, and I was still fruitlessly revolving them when I arrived at the modest inn where the inquest was to be held, and I proposed to fortify myself with a correspondingly modest lunch as a preparation for my attendance at the inquiry.

XIII. — THE CORONER’S QUEST

The proceedings of that fine old institution, the coroner’s court, are apt to have their dignity impaired by the somewhat unjudicial surroundings amidst which they are conducted. The present inquiry was to be held in a long room attached to the inn, ordinarily devoted, as its various appurtenances testified, to gatherings of a more convivial character.

Hither I betook myself after a protracted lunch and a meditative pipe, and being the first to arrive—the jury having already been sworn and conducted to the mortuary to view the remains—whiled away the time by considering the habits of the customary occupants of the room by the light of the objects contained in it. A wooden target with one or two darts sticking in it hung on the end wall and invited the Robin Hoods of the village to try their skill; a system of incised marks on the oaken table made sinister suggestions of shove-halfpenny; and a large open box filled with white wigs, gaudily coloured robes and wooden spears, swords and regalia, crudely coated with gilded paper, obviously appertained to the puerile ceremonies of the Order of Druids.

I had exhausted the interest of these relics and had transferred my attentions to the picture gallery when the other spectators and the witnesses began to arrive. Hastily I seated myself in the only comfortable chair besides the one placed at the head of the table, presumably for the coroner; and I had hardly done so when the latter entered accompanied by the jury. Immediately after them came the sergeant, Inspector Badger, one or two plain-clothes men, and finally the divisional surgeon.

The coroner took his seat at the head of the table and opened his book, and the jury seated themselves on a couple of benches on one side of the long table.

I looked with some interest at the twelve ‘good men and true.’ They were a representative group of British tradesmen, quiet, attentive, and rather solemn; but my attention was particularly attracted by a small man with a very large head and a shock of upstanding hair whom I had diagnosed, after a glance at his intelligent but truculent countenance and the shiny knees of his trousers, as the village cobbler. He sat between the broad-shouldered foreman, who looked like a blacksmith, and a dogged, red-faced man whose general aspect of prosperous greasiness suggested the calling of a butcher.

‘The inquiry, gentlemen,’ the coroner commenced, ‘upon which we are now entering concerns itself with two questions. The first is that of identity: who was this person whose body we have just viewed? The second is: How, when, and by what means did he come by his death? We will take the identity first and begin with the circumstances under which the body was discovered.’

Here the cobbler stood up and raised an excessively dirty hand.

‘I rise, Mr. Chairman,’ he said, ‘to a point of order. The other jurymen looked at him curiously and some of them, I regret to say, grinned. ‘You have referred, sir,’ he continued, ‘to the body which we have just viewed. I wish to point out that we have not viewed a body; we have viewed a collection of bones.’

‘We will refer to them as the remains, if you prefer it,’ said the coroner.

‘I do prefer it,’ was the reply, and the objector sat down.

‘Very well,’ rejoined the coroner, and he proceeded to call the witnesses, of whom the first was a labourer who had discovered the bones in the watercress-bed.

‘Do you happen to know how long it was since the watercress-beds had been cleaned out previously?’ the coroner asked, when the witness had told the story of the discovery.

‘They was cleaned out by Mr. Tapper’s orders just before he gave them up. That will be a little better than two years ago. In May it were. I helped to clean ‘em. I worked on this very same place and there wasn’t no bones there then.’

The coroner glanced at the jury. ‘Any questions, gentlemen,’ he asked.
The cobbler directed an intimidating scowl at the witness and demanded:

‘Were you searching for bones when you came on these remains?’

‘Me!’ exclaimed the witness. ‘What should I be searching for bones for?’

‘Don’t prevaricate,’ said the cobbler sternly; ‘answer the question: Yes or no.’

‘No, of course I wasn’t.’

The juryman shook his enormous head dubiously as though implying that he would let it pass this time but it mustn’t happen again; and the examination of the witnesses continued, without eliciting anything that was new to me or giving rise to any incident, until the sergeant had described the finding of the right arm in the Cuckoo Pits.

‘Was this an accidental discovery?’ the coroner asked.

‘No. We had instructions from Scotland Yard to search any likely ponds in this neighbourhood.’

The coroner discreetly forbore to press this matter any further, but my friend the cobbler was evidently on the qui-vive, and I anticipated a brisk cross-examination for Mr. Badger when his turn came. The inspector was apparently of the same opinion, for I saw him cast a glance of the deepest malevolence at the too inquiring disciple of St Crispin. In fact, his turn came next, and the cobbler’s hair stood up with unholy joy.

The finding of the lower half of the trunk in Staple’s Pond at Loughton was the inspector’s own achievement, but he was not boastful about it. The discovery, he remarked, followed naturally on the previous one in the Cuckoo Pits.

‘Had you any private information that led you to search this particular neighbourhood?’ the cobbler asked.

‘We had no private information whatever,’ replied Badger.

‘Now I put it to you,’ pursued the juryman, shaking a forensic, and very dirty, forefinger at the inspector; ‘here are certain remains found at Sidcup; here are certain other remains found at St Mary Cray, and certain others at Lee. All those places are in Kent. Now isn’t it very remarkable that you should come straight down to Epping Forest, which is in Essex, and search for those bones and find ‘em?’

‘We were making a systematic search of all likely places,’ replied Badger.

‘Exactly,’ said the cobbler, with a ferocious grin, ‘that’s just my point. I say, isn’t it very funny that, after finding the remains in Kent some twenty miles from here, with the River Thames between, you should come here to look for the bones and go straight to Staple’s Pond, where they happen to be—and find ‘em?’

‘It would have been more funny,’ Badger replied sourly, ‘if we’d gone straight to a place where they happened not to be—and found them.’

A gratified snigger arose from the other eleven good men and true, and the cobbler grinned savagely; but before he could think of a suitable rejoinder the coroner interposed.

‘The question is not very material,’ he said, ‘and we mustn’t embarrass the police by unnecessary inquiries.’

‘It’s my belief,’ said the cobbler, ‘that he knew they were there all the time.’

‘The witness has stated that he had no private information,’ said the coroner; and he proceeded to take the rest of the inspector’s evidence, watched closely by the critical juror.

The account of the finding of the remains having been given in full, the police surgeon was called and sworn; the jurymen straightened their backs with an air of expectancy, and I turned over a page of my notebook.

‘You have examined the bones at present lying in the mortuary and forming the subject of this inquiry?’ the coroner asked.

‘I have.’

‘Will you kindly tell us what you have observed?’

‘I find that the bones are human bones, and are, in my opinion, all parts of the same person. They form a skeleton which is complete with the exception of the skull, the third finger of the left hand, the knee-caps, and the leg-bones—I mean the bones between the knees and the ankles.’

‘Is there anything to account for the absence of the missing finger?’

‘No. There is no deformity and no sign of its having been amputated during life. In my opinion it was removed after death.’

‘Can you give us any description of the deceased?’

‘I should say that these are the bones of an elderly man, probably over sixty years of age, about five feet eight and a half inches in height, of rather stout build, fairly muscular, and well preserved. There are no signs of disease excepting some old-standing rheumatic gout of the right hip-joint.’

‘Can you form any opinion as to the cause of death?’
‘No. There are no marks of violence or signs of injury. But it will be impossible to form any opinion as to the cause of death until we have seen the skull.’

‘Did you note anything else of importance?’

‘Yes. I was struck by the appearance of anatomical knowledge and skill on the part of the person who dismembered the body. The knowledge of anatomy is proved by the fact that the corpse has been divided into definite anatomical regions. For instance, the bones of the neck are complete and include the top joint of the backbone known as the atlas; whereas a person without anatomical knowledge would probably take off the head by cutting through the neck. Then the arms have been separated with the scapula (or shoulder-blade) and clavicle (or collar-bone) attached, just as an arm would be removed for dissection.

The skill is shown by the neat way in which the dismemberment has been carried out. The parts have not been rudely hacked asunder, but have been separated at the joints so skilfully that I have not discovered a single scratch or mark of the knife on any of the bones.’

‘Can you suggest any class of person who would be likely to possess the knowledge and skill to which you refer?’

‘It would, of course, be possessed by a surgeon or medical student, and possibly by a butcher.’

‘You think that the person who dismembered this body may have been a surgeon or a medical student?’

‘Yes; or a butcher. Some one accustomed to the dismemberment of bodies and skilful with the knife.’

Here the cobbler suddenly rose to his feet.

‘I rise, Mr. Chairman,’ said he, ‘to protest against the statement that has just been made.’

‘What statement?’ demanded the coroner.

‘Against the aspersion,’ continued the cobbler, with an oratorical flourish, ‘that has been cast upon a honourable calling.’

‘I don’t understand you,’ said the coroner.

‘Doctor Summers has insinuated that this murder was committed by a butcher. Now a member of that honourable calling is sitting on this jury—’

‘You let me alone,’ growled the butcher.

‘I will not let you alone,’ persisted the cobbler. ‘I desire—’

‘Oh, shut up, Pope!’ This was from the foreman, who, at the same moment, reached out an enormous hairy hand with which he grabbed the cobbler’s coat-tails and brought him into a sitting posture with a thump that shook the room.

But Mr. Pope, though seated, was not silenced. ‘I desire,’ he said, ‘to have my protest put on record.’

‘I can’t do that,’ said the coroner, ‘and I can’t allow you to interrupt the witnesses.’

‘I am acting,’ said Mr. Pope, ‘in the interests of my friend here and the members of a honourable—’

But here the butcher turned on him savagely, and, in a hoarse stage-whisper, exclaimed:

‘Look here, Pope; you’ve got too much of what the cat licks—’

‘Gentlemen! gentlemen!’ the coroner protested sternly; ‘I cannot permit this unseemly conduct. You are forgetting the solemnity of the occasion and your own responsible positions. I must insist on more decent and decorous behaviour.’

There was profound silence, in the midst of which the butcher concluded in the same hoarse whisper:

‘—licks ‘er paws with.’

The coroner cast a withering glance at him, and, turning to the witness, resumed the examination.

‘Can you tell us, Doctor, how long a time has elapsed since the death of the deceased?’

‘I should say not less than eighteen months, but probably more. How much more it is impossible from inspection alone to say. The bones are perfectly clean—that is, clean of all soft structures—and will remain substantially in their present condition for many years.’

The evidence of the man who found the remains in the watercress-bed suggests that they could not have been there for more than two years. Do the appearances in your opinion agree with that view?’

‘Yes; perfectly.’

‘There is one more point, Doctor; a very important one. Do you find anything in any of the bones, or all of them together, which would enable you to identify them as the bones of any particular individual?’

‘No,’ replied Dr. Summers; ‘I found no peculiarity that could furnish the means of personal identification.’

‘The description of a missing individual has been given to us,’ said the coroner; ‘a man, fifty-nine years of age, five feet eight inches in height, healthy, well preserved, rather broad in build, and having an old Pott’s fracture of the left ankle. Do the remains that you have examined agree with that description?’
‘Yes, so far as agreement is possible. There is no disagreement.’

‘The remains might be those of that individual?’

‘They might; but there is no positive evidence that they are. The description would apply to a large proportion of elderly men, except as to the fracture.’

‘You found no signs of such a fracture?’

‘No. Pott’s fracture affects the bone called the fibula. That is one of the bones that has not yet been found, so there is no evidence on that point. The left foot was quite normal, but then it would be in any case, unless the fracture had resulted in great deformity.’

‘You estimated the height of the deceased as half an inch greater than that of the missing person. Does that constitute a disagreement?’

‘No; my estimate is only approximate. As the arms are complete and the legs are not, I have based my calculations on the width across the two arms. But measurement of the thigh-bones gives the same result. The length of the thigh-bones is one foot seven inches and five-eighths.’

‘So the deceased might not have been taller than five feet eight?’

‘That is so; from five feet eight to five feet nine.’

‘Thank you. I think that is all we want to ask you, Doctor; unless the jury wish to put any questions.’

He glanced uneasily at that august body, and instantly the irrepressible Pope rose to the occasion.

‘About that finger that is missing,’ said the cobbler. ‘You say that it was cut off after death?’

‘That is my opinion.’

‘Now can you tell us why it was cut off?’

‘No, I cannot.’

‘Oh, come now, Doctor Summers, you must have formed some opinion on the subject.’

Here the coroner interposed. ‘The Doctor is only concerned with the evidence arising out of the actual examination of the remains. Any personal opinions or conjectures that he may have formed are not evidence, and he must not be asked about them.’

‘But, sir,’ objected Pope, ‘we want to know why that finger was cut off. It couldn’t have been took off for no reason. May I ask, sir, if the person who is missing had anything peculiar about that finger?’

‘Nothing is stated to that effect in the written description,’ replied the coroner.

‘Perhaps,’ suggested Pope, ‘Inspector Badger can tell us.’

‘I think,’ said the coroner, ‘we had better not ask the police too many questions. They will tell us anything that they wish to be made public.’

‘Oh, very well,’ snapped the cobbler. ‘If it’s a matter of hushing it up I’ve got no more to say; only I don’t see how we are to arrive at a verdict if we don’t have the facts put before us.’

All the witnesses having now been examined, the coroner proceeded to sum up and address the jury.

‘You have heard the evidence, gentlemen, of the various witnesses, and you will have perceived that it does not enable us to answer either of the questions that form the subject of this inquiry. We now know that the deceased was an elderly man, about sixty years of age, and about five feet eight to nine in height; and that his death took place from eighteen months to two years ago. That is all we know. From the treatment to which the body has been subjected we may form conjectures as to the circumstances of his death. But we have no actual knowledge. We do not know who the deceased was or how he came by his death. Consequently, it will be necessary to adjourn this inquiry until fresh facts are available, and as soon as that is the case, you will receive due notice that your attendance is required.’

The silence of the Court gave place to the confused noise of moving chairs and a general outbreak of eager talk, amidst which I rose and made my way out into the street. At the door I encountered Dr. Summers, whose dog-cart was waiting close by.

‘Are you going back to town now?’ he asked.

‘Yes,’ I answered; ‘as soon as I can catch a train.’

‘If you jump into my cart I’ll run you down in time for the five-one. You’ll miss it if you walk.’

I accepted his offer thankfully, and a minute later was spinning briskly down the road to the station.

‘Queer little devil, that man Pope,’ Dr. Summers remarked. ‘Quite a character; a socialist, labourite, agitator, general crank; anything for a row.’

‘Yes,’ I answered; ‘that was what his appearance suggested. It must be trying for the coroner to get a truculent rascal like
that on a jury.’

Summers laughed. ‘I don’t know. He supplies the comic relief. And then, you know, those fellows have their uses. Some of his questions were pretty pertinent.’

‘So Badger seemed to think.’

‘Yes, by Jove,’ chuckled Summers. ‘Badger didn’t like him a bit; and I suspect the worthy inspector was sailing pretty close to the wind in his answers.’

‘You think he really has some private information?’

‘Depends upon what you mean by “information.” The police are not a speculative body. They wouldn’t be taking all this trouble unless they had a pretty straight tip from somebody. How are Mr. and Miss Bellingham? I used to know them when they lived here.’

I was considering a discreet answer to this question when we swept into the station yard. At the same moment the train drew up at the platform, and, with a hurried hand-shake and hastily spoken thanks, I sprang from the dog-cart and darted into the station.

During the rather slow journey homewards I read over my notes and endeavoured to extract from the facts they set forth some significance other than that which lay on the surface, but without much success. Then I fell to speculating on what Thorndyke would think of the evidence at the inquest and whether he would be satisfied with the information that I had collected. These speculations lasted me, with occasional digressions, until I arrived at the Temple and ran up the stairs rather eagerly to my friends’ chambers.

But here a disappointment awaited me. The nest was empty with the exception of Polton, who appeared at the laboratory door in his white apron, with a pair of flat-nosed pliers in his hand.

‘The Doctor had to go down to Bristol to consult over an urgent case,’ he explained, ‘and Doctor Jervis has gone with him. They’ll be away a day or two, I expect, but the Doctor left this note for you.’

He took a letter from the shelf, where it had been stood conspicuously on edge, and handed it to me. It was a short note from Thorndyke apologising for his sudden departure and asking me to give Polton my notes with any comments that I had to make.

‘You will be interested to learn,’ he added, ‘that the application will be heard in the Probate Court the day after to- morrow. I shall not be present, of course, nor will Jervis, so I should like you to attend and keep your eyes open for anything that may happen during the hearing and that may not appear in the notes that Marchmont’s clerk will be instructed to take. I have retained Dr. Payne to stand by and help you with the practice, so that you can attend the Court with a clear conscience.’

This was highly flattering and quite atoned for the small disappointment; with deep gratification at the trust that Thorndyke had reposed in me, I pocketed the letter, handed my notes to Polton, wished him ‘Good-evening,’ and betook myself to Fetter Lane.

XIV. — WHICH CARRIES THE READER INTO THE PROBATE COURT

THE Probate Court wore an air of studious repose when I entered with Miss Bellingham and her father. Apparently the great and inquisitive public had not become aware of the proceedings that were about to take place, or had not realised their connection with the sensational ‘Mutilation Case’; but barristers and Pressmen, better informed, had gathered in some strength, and the hum of their conversation filled the air like the droning of the voluntary that ushers in a cathedral service.

As we entered, a pleasant-faced, elderly gentleman rose and came forward to meet us, shaking Mr. Bellingham’s hand cordially and saluting Miss Bellingham with a courtly bow.

‘This is Mr. Marchmont, Doctor,’ said the former, introducing me; and the solicitor, having thanked me for the trouble I had taken in attending at the inquest, led us to a bench, at the farther end of which was seated a gentleman whom I recognised as Mr. Hurst.

Mr. Bellingham recognised him at the same moment and glared at him wrathfully.

‘I see that scoundrel is here!’ he exclaimed in a distinctly audible voice, ‘pretending that he doesn’t see me, because he is ashamed to look me in the face, but—’

‘Hush! hush! my dear sir,’ exclaimed the horrified solicitor; ‘we mustn’t talk like that, especially in this place. Let me beg you—let me entreat you to control your feelings, to make no indiscreet remarks; in fact, to make no remarks at all,’ he added, with the evident conviction that any remarks that Mr. Bellingham might make would be certain to be indiscreet.

‘Forgive me, Marchmont,’ Mr. Bellingham replied contritely. ‘I will control myself; I will really be quite discreet. I won’t even look at him again—because, if I do, I shall probably go over and pull his nose.’

This form of discretion did not appear to be quite to Mr. Marchmont’s liking, for he took the precaution of insisting that
Miss Bellingham and I should sit on the farther side of his client, and thus effectually separate him from his enemy.

‘Who’s the long-nosed fellow talking to Jellicoe?’ Mr. Bellingham asked.

‘That is Mr. Loram, KG, Mr. Hurst’s counsel; and the convivial-looking gentleman next to him is our counsel, Mr. Heath, a most able man and’—here Mr. Marchmont whispered behind his hand—‘fully instructed by Doctor Thorndyke.’

At this juncture the judge entered and took his seat; the usher proceeded with great rapidity to swear in the jury, and the Court gradually settled down into that state of academic quiet which it maintained throughout the proceedings, excepting when the noisy swing-doors were set oscillating by some bustling clerk or reporter.

The judge was a somewhat singular-looking old gentleman, very short as to his face and very long as to his mouth; which peculiarities, together with a pair of large and bulging eyes (which he usually kept closed), suggested a certain resemblance to a frog. And he had a curious frog-like trick of flattening his eyelids—as if in the act of swallowing a large beetle—which was the only outward and visible sign of emotion that he ever displayed.

As soon as the swearing in of the jury was completed Mr. Loram rose to introduce the case; whereupon his lordship leaned back in his chair and closed his eyes, as if bracing himself for a painful operation.

The present proceedings,’ Mr. Loram explained, ‘are occasioned by the unaccountable disappearance of Mr. John Bellingham, of 141, Queen Square, Bloomsbury, which occurred about two years ago, or, to be more precise, on the twenty-third of November, nineteen hundred and two. Since that date nothing has been heard of Mr. Bellingham, and, as there are certain substantial reasons for believing him to be dead, the principal beneficiary under his will, Mr. George Hurst, is now applying to the Court for permission to presume the death of the testator and prove the will. As the time which has elapsed since the testator was last seen alive is only two years, the application is based upon the circumstances of the disappearance, which were, in many respects, very singular, the most remarkable feature of that disappearance being, perhaps, its suddenness and completeness.’

Here the judge remarked in a still, small voice that ‘It would, perhaps, have been even more remarkable if the testator had disappeared gradually and incompletely.’

‘No doubt, my lord,’ agreed Mr. Loram; ‘but the point is that the testator, whose habits had always been regular and orderly, disappeared on the date mentioned without having made any of the usual provisions for the conduct of his affairs, and has not since then been seen or heard of.’

With this preamble Mr. Loram proceeded to give a narrative of the events connected with the disappearance of John Bellingham, which was substantially identical with that which I had read in the newspapers; and having laid the actual facts before the jury, he went on to discuss their probable import.

‘Now, what conclusion,’ he asked, ‘will this strange, this most mysterious train of events suggest to an intelligent person who shall consider it impartially? Here is a man who steps forth from the house of his cousin or his brother, as the case may be, and forthwith, in the twinkling of an eye, vanishes from human ken. What is the explanation? Did he steal forth and, without notice or hint of his intention, take train to some seaport, thence to embark for some distant land, leaving his affairs to take care of themselves and his friends to speculate vainly as to his whereabouts? Is he now hiding abroad, or even at home, indifferent alike to the safety of his own considerable property and the peace of mind of his friends? Or is it that death has come upon him unawares by sickness, by accident, or, more probably, by the hand of some unknown criminal? Let us consider the probabilities.

‘Can he have disappeared by his own deliberate act? Why not? it may be asked. Men undoubtedly do disappear from time to time, to be discovered by chance or to reappear voluntarily after intervals of years and find their names almost forgotten and their places filled by new-comers. Yes; but there is always some reason for a disappearance of this kind, even though it be a bad one. Family discords that make life a weariness; pecuniary difficulties that make life a succession of anxieties; distaste for particular circumstances and surroundings from which there seems no escape; inherent restlessness and vagabond tendencies, and so on.

‘Do any of these explanations apply to the present case? No, they do not. Family discords—alast those capable of producing chronic misery—appertain exclusively to a married state. But the testator was a bachelor with no encumbrances whatever. Pecuniary anxieties can be equally excluded. The testator was in easy, in fact, in affluent circumstances. His mode of life was apparently agreeable and full of interest and activity, and he had full liberty of change if he wished. He had been accustomed to travel, and could do so again without absconding. He had reached an age when radical changes do not seem desirable. He was a man of fixed and regular habits, and his regularity was of his own choice and not due to compulsion or necessity. When last seen by his friends, as I shall prove, he was proceeding to a definite destination with the expressed intention of returning for purposes of his own appointing. He did return and then vanished, leaving those purposes unachieved.

‘If we conclude that he has voluntarily disappeared and is at present in hiding, we adopt an opinion that is entirely at variance with all these weighty facts. If, on the other hand, we conclude that he has died suddenly, or has been killed by an accident or otherwise, we are adopting a view that involves no inherent improbabilities and that is entirely congruous with the known facts; facts that will be proved by the testimony of the witnesses whom I shall call. The supposition that the testator is dead is not only more probable than that he is alive; I submit it is the only reasonable explanation of the circumstances of his disappearance.'
‘But this is not all. The presumption of death which arises so inevitably out of the mysterious and abrupt manner in which the testator disappeared has recently received most conclusive and dreadful confirmation. On the fifteenth of July last there were discovered at Sidcup the remains of a human arm—a left arm, gentlemen, from the hand of which the third, or ring, finger was missing. The doctor who has examined that arm will tell you that the finger was cut off either after death or immediately before; and his evidence will prove conclusively that that arm must have been deposited in the place where it was found just about the time when the testator disappeared. Since that first discovery, other portions of the same mutilated body have come to light; and it is a strange and significant fact that they have all been found in the immediate neighbourhood of Eltham or Woodford. You will remember, gentlemen, that it was either at Eltham or Woodford that the testator was last seen alive.

‘And now observe the completeness of the coincidence. These human remains, as you will be told presently by the experienced and learned medical gentleman who has examined them most exhaustively, are those of a man of about sixty years of age, about five feet eight inches in height, fairly muscular and well preserved, apparently healthy, and rather stoutly built. Another witness will tell you that the missing man was about sixty years of age, about five feet eight inches in height, fairly muscular and well preserved, apparently healthy, and rather stoutly built. And—another most significant and striking fact—the testator was accustomed to wear upon the third finger of his left hand—the very finger that is missing from the remains that were found—a most peculiar ring, which fitted so tightly that he was unable to get it off after once putting it on; a ring, gentlemen, of so peculiar a pattern that had it been found on the body must have instantly established the identity of the remains. In a word, gentlemen, the remains which have been found are those of a man exactly like the testator; they differ from him in no respect whatever; they display a peculiar and well preserved, apparently healthy, and rather stoutly built. And—another most significant and striking fact—the testator was accustomed to wear upon the third finger of his left hand—the very finger that is missing from the remains that were found—a most peculiar ring, which fitted so tightly that he was unable to get it off after once putting it on; a ring, gentlemen, of so peculiar a pattern that had it been found on the body must have instantly established the identity of the remains. In a word, gentlemen, the remains which have been found are those of a man exactly like the testator; they differ from him in no respect whatever; they display a peculiar and

Mr. Loram sat down, and adjusting a pair of pince-nez, rapidly glanced over his brief while the usher was administering the oath to the first witness.

This was Mr. Jellicoe, who stepped into the box and directed a stony gaze at the (apparently) unconscious judge. The usual preliminaries having been gone through, Mr. Loram proceeded to examine him.

‘You were the testator’s solicitor and confidential agent, I believe?’
‘I was—and am.’
‘How long have you known him?’
‘Twenty-seven years.’
‘Judging from your experience of him, should you say that he was a person likely to disappear voluntarily and suddenly to cease to communicate with his friends?’
‘No.’
‘Kindly give your reasons for that opinion.’

Such conduct on the part of the testator would be entirely opposed to his habits and character as they are known to me. He was exceedingly regular and businesslike in his dealings with me.

When travelling abroad he always kept me informed as to his whereabouts, or, if he was likely to be beyond reach of communications, he always advised me beforehand. One of my duties was to collect a pension which he drew from the Foreign Office, and on no occasion, previous to his disappearance, has he ever failed to furnish me punctually with the necessary documents.

‘Had he, so far as you know, any reasons for wishing to disappear?’
‘No.’
‘When and where did you last see him alive?’
‘At six o’clock in the evening, on the fourteenth of October, nineteen hundred and two, at 141, Queen Square, Bloomsbury.’

‘Kindly tell us what happened on that occasion.’

The testator had called for me at my office at a quarter past three, and asked me to come with him to his house to meet Doctor Norbury. I accompanied him to 141, Queen Square, and shortly after we arrived Doctor Norbury came to look at some antiquities that the testator proposed to give to the British Museum. The gift consisted of a mummy with four Canopic jars and other tomb-furniture which the testator stipulated should be exhibited together in a single case and in the state in which they were presented. Of these objects, the mummy only was ready for inspection. The tomb-furniture had not yet arrived in England, but was expected within a week. Doctor Norbury accepted the gift on behalf of the Museum, but could not take possession of the objects until he had communicated with the Director and obtained his formal authority. The testator accordingly gave me certain instructions concerning the delivery of the gift, as he was leaving England that evening.’
‘Are those instructions relevant to the subject of this inquiry?’

‘I think they are. The testator was going to Paris, and perhaps thence to Vienna. He instructed me to receive and unpack the tomb-furniture on its arrival, and to store it, with the mummy, in a particular room, where it was to remain for three weeks. If he returned within that time he was to hand it over in person to the Museum authorities; if he had not returned within that time, he desired me to notify the Museum authorities that they were at liberty to take possession of and remove the collection at their convenience. From these instructions I gathered that the testator was uncertain as to the length of his absence from England and the extent of his journey.’

‘Did he state precisely where he was going?’

‘No. He said he was going to Paris and perhaps to Vienna, but he gave no particulars and I asked for none.’ ‘Do you, in fact, know where he went?’

‘No. He left the house at six o’clock wearing a long, heavy overcoat and carrying a suit-case and an umbrella. I wished him “Good-bye” at the door and watched him walk away as if going towards Southampton Row. I have no idea where he went, and I never saw him again.’

‘Had he no other luggage than the suit-case?’ ‘I do not know, but I believe not. He was accustomed to travel with the bare necessities, and to buy anything further he wanted en route.’

‘Did he say anything to the servants as to the probable date of his return?’

‘There were no servants excepting the caretaker. The house was not used for residential purposes. The testator slept and took his meals at his club, though he kept his clothes at the house.’ ‘Did you receive any communication from him after he left?’ ‘No. I never heard from him again in any way. I waited for three weeks as he had instructed me, and then notified the Museum authorities that the collection was ready for removal. Five days later Doctor Norbury came and took formal possession of it, and it was transferred to the Museum forthwith.’ ‘When did you next hear of the testator?’

‘On the twenty-third of November following at a quarter-past seven in the evening. Mr. George Hurst came to my rooms, which are over my office, and informed me that the testator had called at his house during his absence and had been shown into the study to wait for him. That on his—Mr. Hurst’s—arrival it was found that the testator had disappeared without acquainting the servants of his intended departure, and without being seen by anyone to leave the house. Mr. Hurst thought this so remarkable that he had hastened up to town to inform me. I also thought it a remarkable circumstance, especially as I had received no communication from the testator, and we both decided that it was advisable to inform the testator’s brother, Godfrey, of what had happened.

‘Accordingly—Mr. Hurst and I proceeded as quickly as possible to Liverpool Street and took the first train available to Woodford, where Mr. Godfrey Bellingham then resided. We arrived at his house at five minutes to nine, and were informed by the servant that he was not at home, but that his daughter was in the library, which was a detached building situated in the grounds. The servant lighted a lantern and conducted us through the grounds to the library, where we found Mr. Godfrey Bellingham and Miss Bellingham. Mr. Godfrey had only just come in and had entered by the back gate, which had a bell that rang in the library. Mr. Hurst informed Mr. Godfrey of what had occurred, and then we left the library to walk up to the house. A few paces from the library I noticed by the light of the lantern, which Mr. Godfrey was carrying, a small object lying on the lawn. I pointed it to him and he picked it up, and then we all recognised it as a scarab that the testator was accustomed to wear on his watch-chain. It was fitted with a gold wire passed through the suspension hole and a gold ring. Both the wire and the ring were in position, but the ring was broken. We went to the house and questioned the servants as to visitors; but none of them had seen the testator, and they all agreed that no visitor whatsoever had come to the house during the afternoon or evening. Mr. Godfrey and Miss Bellingham both declared that they had neither seen nor heard anything of the testator, and were both unaware that he had returned to England. As the circumstances were somewhat disquieting, I communicated, on the following morning, with the police and requested them to make inquiries; which they did, with the result that a suit-case bearing the initials “J. B.,” was found to be lying unclaimed in the cloak-room at Charing Cross Station. I was able to identify the suit-case as that which I had seen the testator carry away from Queen Square. I was also able to identify some of the contents. I interviewed the cloak-room attendant, who informed me that the suit-case had been deposited on the twenty-third about 4.15 p.m. He had no recollection of the person who deposited it. It remained unclaimed in the possession of the railway company for three months, and was then surrendered to me.’

‘Were there any marks or labels on it showing the route by which it had travelled?’

‘There were no labels on it and no marks other than the initials “J.B.”’

‘Do you happen to know the testator’s age?’

‘Yes. He was fifty-nine on the eleventh of October, nineteen hundred and two.’

‘Can you tell us what his height was?’

‘Yes. He was exactly five feet eight inches.’

‘What sort of health had he?’

‘So far as I know his health was good. I am not aware that he suffered from any disease. I am only judging by his appearance, which was that of a healthy man.’
‘Should you describe him as well preserved or otherwise?’
‘I should describe him as a well preserved man for his age.’
‘How should you describe his figure?’
‘I should describe him as rather broad and stout in build, and fairly muscular, though not exceptionally so.’
Mr. Loram made a rapid note of these answers and then said:
‘You have told us, Mr. Jellicoe, that you have known the testator intimately for twenty-seven years. Now, did you ever notice whether he was accustomed to wear any rings upon his fingers?’
‘He wore upon the third finger of his left hand a copy of an antique ring which bore the device of the Eye of Osiris. That was the only ring he ever wore as far as I know.’
‘Did he wear it constantly?’
‘Yes, necessarily; because it was too small for him, and having once squeezed it on he was never able to get it off again.’
This was the sum of Mr. Jellicoe’s evidence, and at its conclusion the witness glanced inquiringly at Mr. Bellingham’s counsel. But Mr. Heath remained seated, attentively considering the notes that he had just made, and finding that there was to be no cross-examination, Mr. Jellicoe stepped down from the box. I leaned back on my bench, and, turning my head, observed Miss Bellingham deep in thought.
‘What do you think of it?’ I asked.
‘It seems very complete and conclusive,’ she replied. And then, with a sigh, she murmured: ‘Poor old Uncle John! How horrid it sounds to talk of him in this cold-blooded, business-like way, as “the testator,” as if he were nothing but a sort of algebraical sign.’
‘There isn’t much room for sentiment, I suppose, in the proceedings of the Probate Court,’ I replied. To which she assented, and then asked: ‘Who is this lady?’
‘This lady’ was a fashionably dressed young woman who had just bounded into the witness-box and was now being sworn. The preliminaries being finished, she answered Miss Bellingham’s question and Mr. Loram’s by stating that her name was Augustina Gwendoline Dobbs, and that she was housemaid to Mr. George Hurst, of The Poplars, Eltham.
‘Mr. Hurst lives alone, I believe?’ said Mr. Loram.
‘I don’t know what you mean by that,’ Miss Dobbs began; but the barrister explained.
‘I mean that I believe he is unmarried?’
‘Well, and what about it?’ the witness demanded tartly.
‘I am asking you a question.’
‘I know that,’ said the witness viciously; ‘and I say that you’ve no business to make any such insinuations to a respectable young lady when there’s a cook-housekeeper and a kitchenmaid living in the house, and him old enough to be my father—’
Here his lordship flattened his eyelids with startling effect, and Mr. Loram interrupted: ‘I make no insinuations. I merely ask, Is your employer, Mr. Hurst, an unmarried man, or is he not?’
‘I never asked him,’ said the witness sulkily.
‘Please answer my question—yes or no.’
‘How can I answer your question? He may be married or he may not. How do I know? I’m no private detective.’
Mr. Loram directed a stupefied gaze at the witness, and in the ensuing silence a plaintive voice came from the bench:
‘Is that point material?’
‘Certainly, my lord,’ replied Mr. Loram.
‘Then, as I see that you are calling Mr. Hurst, perhaps you had better put the question to him. He will probably know.’
Mr. Loram bowed, and as the judge subsided into his normal state of coma he turned to the triumphant witness.
‘Do you remember anything remarkable occurring on the twenty-third of November the year before last?’
‘Yes. Mr. John Bellingham called at our house.’
‘How did you know he was Mr. John Bellingham?’
‘I didn’t; but he said he was, and I supposed he knew.’
‘At what time did he arrive?’
‘At twenty minutes past five in the evening.’
‘What happened then?’
‘I told him that Mr. Hurst had not come home yet, and he said he would wait for him in the study and write some letters;
so I showed him into the study and shut the door."

"What happened next?"

"Nothing. Then Mr. Hurst came home at his usual time—a quarter to six—and let himself in with his key. He went straight into the study where I supposed Mr. Bellingham still was, so I took no notice, but laid the table for two. At six o'clock Mr. Hurst came into the dining-room—he has tea in the City and dines at six—and when he saw the table laid for two he asked the reason. I said I thought Mr. Bellingham was staying to dinner.

"Mr. Bellingham!" says he. "I didn't know he was here. Why didn't you tell me?" he says. "I thought he was with you, sir," I said. "I showed him into the study," I said. "Well, he wasn't there when I came in," he said, "and he isn't there now," he said. "Perhaps he has gone to wait in the drawing-room," he said. So we went and looked in the drawing-room, but he wasn't there. Then Mr. Hurst said he thought Mr. Bellingham must have got tired of waiting and gone away; but I told him I was quite sure he hadn't, because I had been watching all the time. Then he asked me if Mr. Bellingham was alone or whether his daughter was with him, and I said that it wasn't that Mr. Bellingham at all, but Mr. John Bellingham, and then he was more surprised than ever. I said we had better search the house to make sure whether he was there or not, and Mr. Hurst said he would come with me; so we all went over the house and looked in all the rooms, but there was not a sign of Mr. Bellingham in any of them. Then Mr. Hurst got very nervous and upset, and when he had just snatched a little dinner he ran off to catch the six thirty-one train up to town."

"You say that Mr. Bellingham could not have left the house because you were watching all the time. Where were you while you were watching?"

"I was in the kitchen. I could see the front gate from the kitchen window."

"You say that you laid the table for two. Where did you lay it?"

"In the dining-room, of course."

"Could you see the front gate from the dining-room?"

"No, but I could see the study door. The study is opposite the dining-room."

"Do you have to come upstairs to get from the kitchen to the dining-room?"

"Yes, of course you do!"

"Then, might not Mr. Bellingham have left the house while you were coming up the stairs?"

"No, he couldn't have done."

"Why not?"

"Because it would have been impossible."

"But why would it have been impossible?"

"Because he couldn't have done it."

"I suggest that Mr. Bellingham left the house quietly while you were on the stairs?"

"No, he didn't."

"How do you know he didn't?"

"I am quite sure he didn't."

"But how can you be certain?"

"Because I should have seen him if he had."

"But I mean when you were on the stairs."

"He was in the study when I was on the stairs."

"How do you know he was in the study?"

"Because I showed him in there and he hadn't come out."

Mr. Loram paused and took a deep breath, and his lordship flattened his eyelids.

"Is there a gate to the premises?" the barrister resumed warily.

"Yes. It opens into a narrow lane at the side of the house."

"And there is a French window in the study, is there not?"

"Yes. It opens on to the small grass plot opposite the side gate."

"Were the window and the gate locked or would it have been possible for Mr. Bellingham to let himself out into the lane?"

"The window and the gate both have catches on the inside. He could have got out that way, but, of course, he didn't."

"Why not?"
‘Well, no gentleman would go creeping out the back way like a thief.’
‘Did you look to see if the French window was shut and fastened after you missed Mr. Bellingham?’
‘I looked at it when we shut the house up for the night. It was then shut and fastened on the inside.’
‘And the side gate?’
‘That gate was shut and latched. You have to slam the gate to make the latch fasten, so no one could have gone out of the gate without being heard.’

Here the examination-in-chief ended, and Mr. Loram sat down with an audible sigh of relief. Miss Dobbs was about to step down from the witness-box when Mr. Heath rose to cross-examine.

‘Did you see Mr. Bellingham in a good light?’ he asked.
‘Pretty good. It was dark outside, but the hall-lamp was alight.’

‘Kindly look at this’—here a small object was passed across to the witness. ‘It is a trinket that Mr. Bellingham is stated to have carried suspended from his watch-guard. Can you remember if he was wearing it in that manner when he came to the house?’

‘No, he was not.’
‘You are sure of that.’
‘Quite sure.’

‘Thank you. And now I want to ask you about the search that you have mentioned. You say that you went all over the house. Did you go into the study?’

‘No—at least, not until Mr. Hurst had gone to London.’
‘When you did go in, was the window fastened?’
‘Yes.’
‘Could it have been fastened from the outside?’
‘No; there is no handle outside.’
‘What furniture is there in the study?’

‘There is a writing-table, a revolving-chair, two easy chairs, two large book-cases, and a wardrobe that Mr. Hurst keeps his overcoats and hats in.’

‘Does the wardrobe lock?’
‘Yes.’
‘Was it locked when you went in?’
‘I’m sure I don’t know. I don’t go about trying the cupboards and drawers.’
‘What furniture is there in the drawing-room?’

‘A cabinet, six or seven chairs, a Chesterfield sofa, a piano, a silver-table, and one or two occasional tables.’
‘Is the piano a grand or upright?’
‘It is an upright grand.’
‘In what position is it placed?’
‘It stands across a corner near the window.’
‘Is there sufficient room behind it for a man to conceal himself?’

Miss Dobbs was amused and did not dissemble. ‘Oh, yes,’ she sniggered, ‘there’s plenty of room for a man to hide behind it.’

‘When you searched the drawing-room, did you look behind the piano?’
‘No, I didn’t,’ Miss Dobbs replied scornfully.
‘Did you look under the sofa?’
‘Certainly not!’
‘What did you do then?’
‘We opened the door and looked into the room. We were not looking for a cat or a monkey; we were looking for a middle-aged gentleman.’

‘And am I to take it that your search over the rest of the house was conducted in a similar manner?’
‘Certainly. We looked into the rooms, but we did not search under the beds or in the cupboards.’
‘Are all the rooms in the house in use as living or sleeping rooms?’

‘No; there is one room on the second floor that is used as a store and lumber-room, and one on the first floor that Mr. Hurst uses to store trunks and things that he is not using.’

‘Did you look in those rooms when you searched the house?’

‘No.’

‘Have you looked in them since?’

‘I have been in the lumber-room since, but not in the other. It is always kept locked.’

At this point an ominous flattening became apparent in his lordship’s eyelids, but these symptoms passed when Mr. Heath sat down and indicated that he had no further questions to ask.

Miss Dobbs once more prepared to step down from the witness-box when Mr. Loram shot up like a jack-in-the-box.

‘You have made certain statements,’ said he, ‘concerning the scarab which Mr. Bellingham was accustomed to wear suspended from his watch-guard. You say that he was not wearing it when he came to Mr. Hurst’s house on the twenty-third of November, nineteen hundred and two. Are you quite sure of that?’

‘Quite sure.’

‘I must ask you to be very careful in your statement on this point. The question is a highly important one. Do you swear that the scarab was not hanging from his watch-guard?’

‘Yes, I do.’

‘Did you notice the watch-guard particularly?’

‘No; not particularly.’

‘Then what makes you sure that the scarab was not attached to it?’

‘It couldn’t have been.’

‘Why could it not?’

‘Because if it had been there I should have seen it.’

‘What kind of watch-guard was Mr. Bellingham wearing?’

‘Oh, an ordinary sort of watch-guard.’

‘I mean was it a chain or a ribbon or a strap?’

‘A chain, I think—or perhaps a ribbon—or it might have been a strap.’

His lordship flattened his eyelids, but made no further sign and Mr. Loram continued:

‘Did you or did you not notice what kind of watch-guard Mr. Bellingham was wearing?’

‘I did not. Why should I? It was no business of mine.’

‘But yet you are quite sure about the scarab?’

‘Yes, quite sure.’

‘You noticed that then?’

Mr. Loram paused and looked helplessly at the witness; a suppressed titter arose from the body of the Court, and a faint voice from the bench inquired:

‘Are you quite incapable of giving a straightforward answer?’

Miss Dobbs’s only reply was to burst into tears; whereupon Mr. Loram abruptly sat down and abandoned his re-examination.

The witness-box vacated by Miss Dobbs was occupied successively by Dr. Norbury, Mr. Hurst and the cloakroom attendant, none of whom contributed any new facts, but merely corroborated the statements made by Mr. Jellicoe and the housemaid. Then came the labourer who discovered the bones at Sidcup, and who repeated the evidence that he had given at the inquest, showing that the remains could not have been lying in the watercress-bed more than two years. Finally Dr. Summers was called, and, after he had given a brief description of the bones that he had examined, was asked by Mr. Loram:

‘You have heard the description that Mr. Jellicoe has given of the testator?’

‘I have.’

‘Does that description apply to the person whose remains you examined?’

‘In a general way it does.’

‘I must ask you for a direct answer—yes or no. Does it apply?’
'Yes. But I ought to say that my estimate of the height of the deceased is only approximate.'

'Quite so. Judging from your examination of those remains and from Mr. Jellicoe's description, might those remains be the remains of the testator, John Bellingham?'

'Yes, they might.'

On receiving this admission Mr. Loram sat down, and Mr. Heath immediately rose to cross-examine.

'When you examined those remains, Doctor Summers, did you discover any personal peculiarities which would enable you to identify them as the remains of any one individual rather than any other individual of similar size, age, and proportions?'

'No. I found nothing that would identify the remains as those of any particular individual.'

As Mr. Heath asked no further questions, the witness received his dismissal, and Mr. Loram informed the Court that that was his case. The judge bowed somnolently, and then Mr. Heath rose to address the Court on behalf of the respondent. It was not a long speech, nor was it enriched by any displays of florid rhetoric; it concerned itself exclusively with a rebutment of the arguments of the counsel for the petitioner.

Having briefly pointed out that the period of absence was too short to give rise of itself to the presumption of death, Mr. Heath continued:

'The claim therefore rests upon evidence of a positive character. My learned friend asserts that the testator is presumably dead, and it is for him to prove what he has affirmed. Now, has he done this? I submit that he has not. He has argued with great force and ingenuity that the testator, being a bachelor, a solitary man without wife or child, dependant or master, public or private office of duty, or any bond, responsibility, or any other condition limiting his freedom of action, had no reason or inducement for absconding. This is my learned friend's argument, and he has conducted it with so much skill and ingenuity that he has not only succeeded in proving his case; he has proved a great deal too much. For if it is true, as my learned friend so justly argues, that a man thus unfettered by obligations of any kind has no reason for disappearing, is it not even more true that he has no reason for not disappearing? My friend has urged that the testator was at liberty to go where he pleased, when he pleased, and how he pleased; and that therefore there was no need for him to abscond. I reply, if he was at liberty to go away, whither, when, and how he pleased, why do we express surprise that he has made use of his liberty? My learned friend points out that the testator notified to nobody his intention of going away and has acquainted no one with his whereabouts; but, I ask, whom should he have notified? He was responsible to nobody; there was no one dependent upon him; his presence or absence was the concern of nobody but himself. If circumstances suddenly arising made it desirable that he should go abroad, why should he not go? I say there was no reason whatever.

'My learned friend has said that the testator went away leaving his affairs to take care of themselves. Now, gentlemen, I ask you if this can fairly be said of a man whose affairs are, as they have been for many years, in the hands of a highly capable, completely trustworthy agent who is better acquainted with them than the testator himself? Clearly it cannot.

'To conclude this part of the argument: I submit that the circumstances of the so-called disappearance of the testator present nothing out of the ordinary. The testator is a man of ample means, without any responsibilities to fetter his movements, and has been in the constant habit of travelling, often into remote and distant regions. The mere fact that he has been absent somewhat longer; than usual affords no ground whatever for the drastic proceeding of presumption of death and taking possession of his property.

'With reference to the human remains which have been mentioned in connection with the case I need say but little. The attempt; to connect them with the testator has failed completely. You, yourselves have heard Doctor Summers state on oath that they cannot be identified as the remains of any particular person. That would seem to dispose of them effectually. I must remark upon a very singular point that has been raised by the learned counsel for the petitioner, which is this:

'My learned friend points out that these remains were discovered near Eltham and near Woodford and that the testator was last seen alive at one of these two places. This he considers for some reason to be a highly significant fact. But I cannot agree with him. If the testator had been last seen alive at Woodford and the remains had been found at Woodford, or if he had disappeared from Eltham, and the remains had been found at Eltham, that would have had some significance. But he can only have been last seen at one of the places, whereas the remains have been found at both places. Here again my learned friend seems to have proved too much.

'But I need not occupy your time further. I repeat that, in order to justify us in presuming the death of the testator, clear and positive evidence would be necessary. That no such evidence has been brought forward. Accordingly, seeing that the testator may return at any time and is entitled to find his property intact, I shall ask you for a verdict that will secure to him this measure of ordinary justice.'

At the conclusion of Mr. Heath's speech the judge, as if awakening from a refreshing nap, opened his eyes; and uncommonly shrewd, intelligent eyes they were when the expressive eyelids were duly tucked up out of the way. He commenced by reading over a part of the will and certain notes—which he appeared to have made in some miraculous fashion with his eyes shut—and then proceeded to review the evidence and the counsels' arguments for the instruction of the jury.

'Before considering the evidence which you have heard, gentlemen' he said, 'it will be well for me to say a few words to you on the general aspects of the case which is occupying our attention.'
‘If a person goes abroad or disappears from his home and his ordinary places of resort and is absent for a long period of time, the presumption of death arises at the expiration of seven years from the date on which he was last heard of. That is to say, that the total disappearance of an individual for seven years constitutes presumptive evidence that the said individual is dead; and the presumption can be set aside only by the production of evidence that he was alive at some time within that period of seven years. But if, on the other hand, it is sought to presume the death of a person who has been absent for a shorter period than seven years, it is necessary to produce such evidence as shall make it highly probable that the said person is dead. Of course, presumption implies supposition as opposed to actual demonstration; but, nevertheless, the evidence in such a case must be of a kind that tends to create a very strong belief that death has occurred; and I need hardly say that the shorter the period of absence, the more convincing must be the evidence.

‘In the present case, the testator, John Bellingham, has been absent somewhat under two years. This is a relatively short period, and in itself gives rise to no presumption of death. Nevertheless, death has been presumed in a case where the period of absence was even shorter and the insurance recovered; but here the evidence supporting the belief in the occurrence of death was exceedingly weighty.

The testator in this case was a shipmaster, and his disappearance was accompanied by the disappearance of the ship and the entire ship’s company in the course of a voyage from London to Marseilles. The loss of the ship and her crew was the only reasonable explanation of the disappearance, and, short of actual demonstration, the facts offered convincing evidence of the death of all persons on board. I mention this case as an illustration. You are not dealing with speculative probabilities. You are contemplating a very momentous proceeding, and you must be very sure of your ground. Consider what it is that you are asked to do.

The petitioner asks permission to presume the death of the testator in order that the testator’s property may be distributed among the beneficiaries under the will. The granting of such permission involves us in the gravest responsibility. An ill-considered decision might be productive of a serious injustice to the testator, an injustice that could never be remedied. Hence it is incumbent upon you to weigh the evidence with the greatest care, to come to no decision without the profoundest consideration of all the facts.

The evidence that you have heard divides itself into two parts—that relating to the circumstances of the testator’s disappearance, and that relating to certain human remains. In connection with the latter I can only suggest my surprise and regret that the application was not postponed until the completion of the coroner’s inquest, and leave you to consider the evidence. You will bear in mind that Doctor Summers has stated explicitly that the remains cannot be identified as those of any particular individual, but that the testator and the unknown deceased had so many points of resemblance that they might possibly be one and the same person.

With reference to the circumstances of the disappearance, you have heard the evidence of Mr. Jellicoe to the effect that the testator has on no previous occasion gone abroad without informing him as to his proposed destination. But in considering what weight you are to give to this statement you will bear in mind that when the testator set out for Paris after his interview with Doctor Norbury he left Mr. Jellicoe without any information as to his specific destination, his address in Paris, or the precise date when he should return, and that Mr. Jellicoe was unable to tell us where the testator went or what was his business. Mr. Jellicoe was, in fact, for a time without any means of tracing the testator or ascertaining his whereabouts.

The evidence of the housemaid, Dobbs, and of Mr. Hurst is rather confusing. It appears that the testator came to the house, and when looked for later was not to be found. A search of the premises showed that he was not in the house, whence it seems to follow that he must have left it; but since no one was informed of his intention to leave, and he had expressed the intention of staying to see Mr. Hurst, his conduct in thus going surreptitiously must appear somewhat eccentric. The point that you have to consider, therefore, is whether a person who is capable of thus departing in a surreptitious and eccentric manner from a house, without giving notice to the servants, is capable also of departing in a surreptitious and eccentric manner from his usual places of resort without giving notice to his friends or thereafter informing them of his whereabouts.

The questions, then, gentlemen, that you have to ask yourselves before deciding on your verdict are two: first, Are the circumstances of the testator’s disappearance and his continued absence incongruous with his habits and personal peculiarities as they are known to you? and second, Are there any facts which indicate in a positive manner that the testator is dead? Ask yourselves these questions, gentlemen, and the answers to them, furnished by the evidence that you have heard, will guide you to your decision.’

Having delivered himself of the above instructions, the judge applied himself to the perusal of the will with professional gusto, in which occupation he was presently disturbed by the announcement of the foreman of the jury that a verdict had been agreed upon.

The judge sat up and glanced at the jury-box, and when the foreman proceeded to state that ‘We find no sufficient reason for presuming the testator, John Bellingham, to be dead,’ he nodded approvingly. Evidently that was his opinion, too, as he was careful to explain when he conveyed to Mr. Loram the refusal of the Court to grant the permission applied for.

The decision was a great relief to me, and also, I think, to Miss Bellingham; but most of all to her father, who, with instinctive good manners, since he could not suppress a smile of triumph, rose and hastily stumped out of the Court, so that the discomfited Hurst should not see him. His daughter and I followed, and as we left the Court she remarked, with a smile:
‘So our pauperism is not, after all, made absolute. There is still a chance for us in the Chapter of Accidents—and perhaps even for poor old Uncle John.’

**XV. — CIRCUMSTANTIAL EVIDENCE**

THE morning after the hearing saw me setting forth on my round in more than usually good spirits. The round itself was but a short one, for my list contained only a couple of ‘chronics,’ and this, perhaps, contributed to my cheerful outlook on life. But there were other reasons. The decision of the Court had come as an unexpected reprieve and the ruin of my friends’ prospects was at least postponed. Then, I had learned that Thorndyke was back from Bristol and wished me to look in on him; and, finally, Miss Bellingham had agreed to spend this very afternoon with me, browsing round the galleries at the British Museum.

I had disposed of my two patients by a quarter to eleven, and three minutes later was striding down Mitre Court, all agog to hear what Thorndyke had to say with reference to my notes on the inquest. The ‘oak’ was open when I arrived at his chambers, and a modest flourish on the little brass knocker of the inner door was answered by my quondam teacher himself.

‘How good of you, Berkeley,’ he said, shaking hands genially, ‘to look me up so early. I am alone, just looking through the report of the evidence in yesterday’s proceedings.’

He placed an easy chair for me, and, gathering up a bundle of typewritten papers, laid them aside on the table.

‘Were you surprised at the decision?’ I asked.

‘No,’ he answered. ‘Two years is a short period of absence; but still, it might easily have gone the other way. I am greatly relieved. The respite gives us time to carry out our investigations without undue hurry.’

‘Did you find my notes of any use?’ I asked.

‘Heath did. Polton handed them to him, and they were invaluable to him for his cross-examination. I haven’t seen them yet; in fact, I have only just got them back from him. Let us go through them together now.’

He opened a drawer and taking from it my notebook, seated himself, and began to read through my notes with grave attention, while I stood and looked shyly over his shoulder. On the page that contained my sketches of the Sidcup arm, showing the distribution of the snails’ eggs on the bones, he lingered with a faint smile that made me turn hot and red.

‘Those sketches look rather footy,’ I said; ‘but I had to put something in my notebook.’

‘You did not attach any importance, then, to the facts that they illustrated?’

‘No. The egg-patches were there, so I noted the fact. That’s all.’

‘I congratulate you, Berkeley. There is not one man in twenty who would have had the sense to make a careful note of what he considers an unimportant or irrelevant fact; and the investigator who notes only those things that appear significant is perfectly useless. He gives himself no material for reconsideration. But you don’t mean that these egg-patches and worm tubes appeared to you to have no significance at all?’

‘Oh, of course, they show the position in which the bones were lying.’

‘Exactly. The arm was lying, fully extended, with the dorsal side uppermost. But we also learn from these egg-patches that the hand had been separated from the arm before it was thrown into the pond; and there is something very remarkable in that.’

I leaned over his shoulder and gazed at my sketches, amazed at the rapidity with which he had reconstructed the limb from my rough drawings of the individual bones.

‘I don’t quite see how you arrived at it, though,’ I said.

‘Well, look at your drawings. The egg-patches are on the dorsal surface of the scapula, the humerus, and the bones of the fore-arm. But here you have shown six of the bones of the hand: two metacarpals, the os magnum, and three phalanges; and they all have egg-patches on the palmar surface. Therefore the hand was lying palm upwards.’

‘But the hand may have been pronated.’

‘If you mean pronated in relation to the arm, that is impossible, for the position of the egg-patches shows clearly that the bones of the arm were lying in the position of supination. Thus the dorsal surface of the arm and the palmar surface of the hand respectively were uppermost, which is an anatomical impossibility so long as the hand is attached to the arm.’

‘But might not the hand have become detached after lying in the pond some time?’

‘No. It could not have been detached until the ligaments had decayed, and if it had been separated after the decay of the soft parts, the bones would have been thrown into disorder. But the egg-patches are all on the palmar surface, showing that the bones were still in their normal relative positions. No, Berkeley, that hand was thrown into the pond separately from the arm.’

‘But why should it have been?’ I asked.
‘Ah, there is a very pretty little problem for you to consider. And, meantime, let me tell you that your expedition has been a brilliant success. You are an excellent observer. Your only fault is that when you have noted certain facts you don’t seem fully to appreciate their significance—which is merely a matter of inexperience. As to the facts that you have collected, several of them are of prime importance.’

‘I am glad you are satisfied,’ said I, ‘though I don’t see that I have discovered much excepting those snails’ eggs; and they don’t seem to have advanced matters very much.’

‘A definite fact, Berkeley, is a definite asset. Perhaps we may presently find a little space in our Chinese puzzle which this fact of the detached hand will just drop into. But, tell me, did you find nothing unexpected or suggestive about those bones—as to their number and condition, for instance?’

‘Well, I thought it a little queer that the scapula and clavicle should be there. I should have expected him to cut the arm off at the shoulder-joint.’

‘Yes,’ said Thorndyke: ‘so should I; and so it has been done in every case of dismemberment that I am acquainted with. To an ordinary person, the arm seems to join on to the trunk at the shoulder-joint, and that is where he would naturally sever it. What explanation do you suggest of this unusual mode of severing the arm?’

‘Do you think the fellow could have been a butcher?’ I asked, remembering Dr. Summers’ remark. ‘This is the way a shoulder of mutton is taken off.’

‘No,’ replied Thorndyke. ‘A butcher includes the scapula in a shoulder of mutton for a specific purpose, namely, to take off a given quantity of meat. And also, as a sheep has no clavicle, it is the easiest way to detach the limb. But I imagine a butcher would find himself in difficulties if he attempted to take off a man’s arm in that way. The clavicle would be a new and perplexing feature. Then, too a butcher does not deal very delicately with his subject; if he has to divide a joint, he just cuts through it and does not trouble himself to avoid marking the bones. But you note here that there is not a single scratch or score on any one of the bones, not even where the finger was removed. Now, if you have ever prepared bones for a museum, as I have, you will remember the extreme care that is necessary in disarticulating joints to avoid disfiguring the articular ends of the bones with cuts and scratches.’

‘Then you think that the person who dismembered this body must have had some anatomical knowledge and skill?’

‘That is what has been suggested. The suggestion is not mine.’

‘Then I infer that you don’t agree?’

Thorndyke smiled. ‘I am sorry to be so cryptic, Berkeley, but you understand that I can’t make statements. Still, I am trying to lead you to make certain inferences from the facts that are in your possession.’

‘If I make the right inference, will you tell me?’ I asked.

‘It won’t be necessary,’ he answered, with the same quiet smile. ‘When you have fitted the puzzle together you don’t need to be told you have done it.’

It was most infernally tantalising. I pondered on the problem with a scowl of such intense cogitation that Thorndyke laughed outright.

‘It seems to me,’ I said, at length, ‘that the identity of the remains is the primary question and that it is a question of fact. It doesn’t seem any use to speculate about it.’

‘Exactly. Either these bones are the remains of John Bellingham or they are not. There will be no doubt on the subject when all the bones are assembled—if ever they are. And the settlement of that question will probably throw light on the further question: Who deposited them in the places in which they were found? But to return to your observations: did you gather nothing from the other bones? From the complete state of the neck vertebrae, for instance?’

‘Well, it did strike me as rather odd that the fellow should have gone to the trouble of separating the atlas from the skull. He must have been very handy with the scalpel to have done it as cleanly as he seems to have done; but I don’t see why he should have gone about the business in the most inconvenient way.’

‘You notice the uniformity of method. He has separated the head from the spine, instead of cutting through the spine lower down, as most persons would have done: he removed the arms with the entire shoulder-girdle, instead of simply cutting them off at the shoulder-joints. Even in the thighs the same peculiarity appears; for in neither case was the knee-cap found with the thigh-bone, although it seems to have been searched for. Now the obvious way to divide the leg is to cut through the patellar ligament, leaving the knee-cap attached to the thigh. But in this case, the knee-cap appears to have been left attached to the Shank. Can you explain why this person should have adopted this unusual and rather inconvenient method? Can you suggest a motive for this procedure, or can you think of any circumstances which might lead a person to adopt this method by preference?’

‘It seems as if he wished, for some reason, to divide the body into definite anatomical regions.’

Thorndyke chuckled. ‘You are not offering that suggestion as an explanation, are you? Because it would require more explaining than the original problem. And it is not even true. Anatomically speaking, the knee-cap appertains to the thigh rather than to the shank. It is a sesamoid bone belonging to the thigh muscles; yet in this case it has been left attached, apparently, to the shank. No, Berkeley, that cat won’t jump. Our unknown operator was not preparing a skeleton as a
museum specimen; he was dividing a body up into convenient sized portions for the purpose of conveying them to various ponds. Now what circumstances might have led him to divide it in this peculiar manner?

'I am afraid I have no suggestion to offer. Have you?'

Thorndyke suddenly lapsed into ambiguity. 'I think,' he said, 'it is possible to conceive such circumstances, and so, probably, will you if you think it over.'

'Did you gather anything of importance from the evidence at the inquest?' I asked.

'It is difficult to say,' he replied. 'The whole of my conclusions in this case are based on what is virtually circumstantial evidence. I have not one single fact of which I can say that it admits only of a single interpretation. Still, it must be remembered that even the most inconclusive facts, if sufficiently multiplied, yield a highly conclusive total. And my little pile of evidence is growing, particle by particle; but we mustn’t sit here gossiping at this hour of the day; I have to consult with Marchmont and you say that you have an early afternoon engagement. We can walk together as far as Fleet Street.'

A minute or two later we went our respective ways, Thorndyke towards Lombard Street and I to Fetter Lane, not unmindful of those coming events that were casting so agreeable a shadow before them.

There was only one message awaiting me, and when Adolphus had delivered it (amidst mephitic fumes that rose from the basement, premonitory of fried plaice), I pocketed my stethoscope and betook myself to Gunpowder Alley, the aristocratic abode of my patient, joyfully threading the now familiar passages of Gough Square and Wine Office Court, and meditating pleasantly on the curious literary flavour that pervades these little-known regions. For the shade of the author of ‘Rasselas’ still seems to haunt the scenes of his Titanic labours and his ponderous but homely and temperate rejoicings. Every court and alley whispers of books and of the making of books: forms of type, trundled noisily on trolleys by ink-smereared boys, salute the wayfarer at odd corners; piles of strawboard, rolls or bales of paper, drums of printing-ink or roller composition stand on the pavement outside dark entries; basement windows give glimpses into Hadean caverns tenanted by legions of printer’s devils; and the very air is charged with the hum of press and with odours of glue and paste and oil. The entire neighbourhood is given up to the printer and binder; and even my patient turned out to be a guillotine-knife grinder—a ferocious and revolutionary calling strangely at variance with his harmless appearance and meek bearing.

I was in good time at my tryst, despite the hindrances of fried plaice and invalid guillotinists; but, early as I was, Miss Bellingham was already waiting in the garden—she had been filling a bowl with flowers—ready to sally forth.

'It is quite old times,' she said, as we turned into Fetter Lane, ‘to be going to the Museum together. It brings back the Tell el Amarna tablets and all your kindliness and unselfish labour, suppose we shall walk there to-day?'

'Certainly,' I replied; 'I am not going to share your society with the common mortals who ride in omnibuses. That would be sheer, simple waste. Besides, it is more companionable to walk.'

'Yes, it is; and the bustle of the streets makes one more appreciative of the quiet of the Museum. What are we going to look at when we get there?'

'You must decide that,' I replied. 'You know the collection much better than I do.'

'Well, now,' she mused, ‘I wonder what you would like to see; or, in other words, what I should like you to see. The old English pottery is rather fascinating, especially the Fulham ware. I rather think I shall take you to see that.’

She reflected a while, and then, just as we reached the gate of Staple Inn, she stopped and looked thoughtfully down the Gray’s Inn Road.

‘You have taken a great interest in our “case” as Doctor Thorndyke calls it. Would you like to see the churchyard where Uncle John wished to be buried? It is a little out of our way, but we are not in a hurry, are we?’

I, certainly, was not. Any deviation that might prolong our walk was welcome, and, as to the place—why, all places were alike to me if only she were by my side. Besides, the churchyard was really of some interest, since it was undoubtedly the ‘exciting cause’ of the obnoxious paragraph turned down of the will. I accordingly expressed a desire to make its acquaintance, and we crossed to the entrance to Gray’s Inn Road.

‘Do you ever try,’ she asked, as we turned down the dingy thoroughfare, ‘to picture familiar places as they looked a couple of hundred years ago?’

‘Yes,’ I answered, ‘and very difficult I find it. One has to manufacture the materials for reconstruction, and then the present aspect of the place will keep obtruding itself. But some places are easier to reconstitute than others.’

‘That is what I find,’ said she. ‘Now Holborn, for example, is quite easy to reconstruct, though I daresay the imaginary form isn’t a bit like the original. But there are fragments left, like Staple Inn and the front of Gray’s Inn; and then one has seen prints of the old Middle Row and some of the taverns, so that one has some material with which to help out one’s imagination. But this road we are walking in always baffles me. It looks so old and yet is, for the most part, so new that I find it impossible to make a satisfactory picture of its appearance, say, when Sir Roger de Coverley might have strolled in Gray’s Inn Walks, or farther back, when Francis Bacon had chambers in the Inn.’

‘I imagine,’ said I, ‘that part of the difficulty is in the mixed character of the neighbourhood. Here, on the one side, is old Gray’s Inn, not much changed since Bacon’s time—his chambers are still to be seen, I think, over the gateway; and there, on the Clerkenwell side, is a dense and rather squalid neighbourhood which has grown up over a region partly rural and
wholly fugitive in character. Places like Bagnigge Wells and Hockley in the Hole would not have had many buildings that were likely to survive; and in the absence of surviving specimens the imagination hasn’t much to work from.’

‘I daresay you are right,’ said she. ‘Certainly, the purlieus of old Clerkenwell present a very confused picture to me; whereas, in the case of an old street like, say, Great Ormond Street, one has only to sweep away the modern buildings and replace them with glorious old houses like the few that remain, dig up the roadway and pavements and lay down cobbles-stones, plant a few wooden posts, hang up one or two oil-lamps, and the transformation is complete. And a very delightful transformation it is.’

‘Very delightful; which, by the way, is a melancholy thought. For we ought to be doing better work than our forefathers; whereas what we actually do is to pull down the old buildings, clap the doorways, porticoes, panelling, and mantels in our museums, and then run up something inexpensive and useful and deadly uninteresting in their place.’

My companion looked at me and laughed softly. ‘For a naturally cheerful, and even gay young man,’ said she, ‘you are most amazingly pessimistic. The mantle of Jeremiah—if he ever wore one—seems to have fallen on you, but without in the least impairing your good spirits excepting in regard to matters architectural.’

‘I have much to be thankful for,’ said I. ‘Am I not taken to the Museum by a fair lady? And does she not stay me with mummy cases and comfort me with crockery?’

‘Pottery,’ she corrected; and then as we met a party of grave-looking women emerging from a side-street, she said: ‘I suppose these are lady medical students.’

‘Yes, on their way to the Royal Free Hospital. Note the gravity of their demeanour and contrast it with the levity of the male student.’

‘I was doing so,’ she answered, ‘and wondering why professional women are usually so much more serious than men.’

‘Perhaps,’ I suggested, ‘it is a matter of selection. A peculiar type of woman is attracted to the professions, whereas every man has to earn his living as a matter of course.’

‘Yes, I daresay that is the explanation. This is our turning.’

We passed into Heathcote Street, at the end of which was an open gate giving entrance to one of those disused and metamorphosed burial-grounds that are to be met with in the older districts of London; in which the dispossessed dead are jostled into corners to make room for the living. Many of the headstones were still standing, and others, displaced to make room for asphalted walks and seats, were ranged around by the walls exhibiting inscriptions made meaningless by their removal. It was a pleasant enough place on this summer afternoon, contrasted with the dingy streets whence we had come, though its grass was faded and yellow and the twitter of the birds in the trees mingled with the hideous Board-school drawl of the children who played around the seats and the few remaining tombs.

‘So this is the last resting-place of the illustrious house of Bellingham,’ said I.

‘Yes; and we are not the only distinguished people who repose in this place. The daughter of no less a person than Richard Cromwell is buried here; the tomb is still standing—but perhaps you have been here before, and know it.’

‘I don’t think I have ever been here before; and yet there is something about the place that seems familiar.’ I looked around, cudgelling my brains for the key to the dimly reminiscent sensations that the place evoked; until, suddenly, I caught sight of a group of buildings away to the west, enclosed within a wall heightened by a wooden trellis.

‘Yes, of course!’ I exclaimed. ‘I remember the place now. I have never been in this part before, but in that enclosure beyond, which opens at the end of Henrietta Street, there used to be and may be still, for all I know, a school of anatomy, at which I attended in my first year; in fact, I did my first dissection there.’

‘There was a certain gruesome appropriateness in the position of the school,’ remarked Miss Bellingham. ‘It would have been really convenient in the days of the resurrection men. Your material would have been delivered at your very door. Was it a large school?’

‘The attendance varied according to the time of the year. Sometimes I worked there quite alone. I used to let myself in with a key and hoist my subject out of a sort of sepulchral tank by means of a chain tackle. It was a ghoulish business. You have no idea how awful the body used to look to my unaccustomed eyes, as it rose slowly out of the tank. It was like the resurrection scenes that you see on some old tombstones, where the deceased is shown rising out of his coffin while the skeleton, Death, falls vanquished with his dart shattered and his crown toppling off.

‘I remember, too, that the demonstrator used to wear a blue apron, which created a sort of impression of a cannibal butcher’s shop. But I am afraid I am shocking you.’

‘No you are not. Every profession has its unpresentable aspects, which ought not to be seen by outsiders. Think of the sculptor’s studio and of the sculptor himself when he is modelling a large figure or group in the clay. He might be a bricklayer or a road-sweeper if you judge by his appearance. This is the tomb I was telling you about.’

We halted before the plain coffer of stone, weathered and wasted by age, but yet kept in decent repair by some pious hands, and read the inscription, setting forth with modest pride, that here reposed Anna, sixth daughter of Richard Cromwell, ‘The Protector.’ It was a simple monument and commonplace enough, with the crude severity of the ascetic age to which it belonged. But still, it carried the mind back to those stirring times when the leafy shades of Gray’s Inn Lane
must have resounded with the clank of weapons and the tramp of armed men; when this bald recreation-ground was a rustic churchyard, standing amidst green fields and hedgerows, and countrymen leading their pack-horses into London through the Lane would stop to look in over the wooden gate.

Miss Bellingham looked at me critically as I stood thus reflecting, and presently remarked: 'I think you and I have a good many mental habits in common.'

'I looked up inquiringly, and she continued: 'I notice that an old tombstone seems to set you meditating. So it does me. When I look at an ancient monument, and especially an old headstone, I find myself almost unconsciously retracing the years to the date that is written on the stone. Why do you think that is? Why should a monument be so stimulating to the imagination? And why should a common headstone be more so than any other?'

'I suppose it is,' I answered reflectively, 'that a churchyard monument is a peculiarly personal thing and appertains in a peculiar way to a particular time. And the circumstance that it has stood untouched by the passing years while everything around has changed, helps the imagination to span the interval. And the common headstone, the memorial of some dead and gone farmer or labourer who lived and died in the village hard by, is still more intimate and suggestive. The rustic, childish sculpture of the village mason and the artless doggerel of the village schoolmaster, bring back the time and place and the conditions of life more vividly than the more scholarly inscriptions and the more artistic enrichments of monuments of greater pretensions. But where are your own family tombstones?'

'They are over in that farther corner. There is an intelligent, but inopportune, person apparently copying the epitaphs. I wish he would go away. I want to show them to you.'

I now noticed, for the first time, an individual engaged, notebook in hand, in making a careful survey of a group of old headstones. Evidently he was making a copy of the inscriptions, for not only was he poring attentively over the writing on the face of the stone, but now and again he helped out his vision by running his fingers over the worn lettering.

'That is my grandfather's tombstone that he is copying now,' said Miss Bellingham; and even as she spoke, the man turned and directed a searching glance at us with a pair of keen, spectacled eyes.

Simultaneously we uttered an exclamation of surprise; for the investigator was Mr. Jellicoe.
WHETHER or not Mr. Jellicoe was surprised to see us, it is impossible to say. His countenance (which served the ordinary purposes of a face, inasmuch as it contained the principal organs of special sense, with inlets to the alimentary and respiratory tracts) was, as an apparatus for the expression of the emotions, a total failure. To a thought-reader it would have been about as helpful as the face carved upon the handle of an umbrella; a comparison suggested, perhaps, by a certain resemblance to such an object. He advanced, holding open his notebook and pencil, and having saluted us with a stiff bow and an old-fashioned flourish of his hat, shook hands rheumatically and waited for us to speak.

'This is an unexpected pleasure, Mr. Jellicoe,' said Miss Bellingham.

'It is very good of you to say so,' he replied.

'And quite a coincidence—that we should all happen to come here on the same day.'

'A coincidence, certainly,' he admitted, 'and if we all happened not to come—which must have occurred frequently—that also would have been a coincidence.'

'I suppose it would,' said she, 'but I hope we are not interrupting you.'

'Thank you, no. I had just finished when I had the pleasure of perceiving you.'

You were making some notes in reference to the case, I imagine,' said I. It was an impertinent question, put with malice aforethought for the mere pleasure of hearing him evade it.

'The case?' he repeated. 'You are referring, perhaps, to Stevens versus the Parish Council?'

'I think Doctor Berkeley was referring to the case of my uncle's will,' Miss Bellingham said quite gravely, though with a suspicious dimpling about the corners of her mouth.

'Indeed,' said Mr. Jellicoe. 'There is a case, is there; a suit?'

'I mean the proceedings instituted by Mr. Hurst.'

'Oh, but that was merely an application to the Court, and is, moreover, finished and done with. At least, so I understand. I speak, of course, subject to correction; I am not acting for Mr. Hurst, you will be pleased to remember. As a matter of fact,' he continued, after a brief pause, 'I was just refreshing my memory as to the wording of the inscriptions on these stones, especially that of your grandfather, Francis Bellingham. It has occurred to me that if it should appear by the finding of the coroner's jury that your uncle is deceased, it would be proper and decorous that some memorial should be placed here. But, as the burial ground is closed, there might be some difficulty about erecting a new monument, whereas there would probably be none in adding an inscription to one already existing. Hence these investigations. For if the inscriptions on your grandfather's stone had set forth that "here rests the body of Francis Bellingham," it would have been manifestly improper to add "also that of John Bellingham, son of the above". Fortunately the inscription was more discreetly drafted, merely recording the fact that this monument is "sacred to the memory of the said Francis," and not committing itself as to the whereabouts of the remains. But perhaps I am interrupting you.'

'No, not at all,' replied Miss Bellingham (which was grossly untrue; he was interrupting me most intolerably); 'we were going to the British Museum and just looked in here on our way.'

'Ha,' said Mr. Jellicoe, 'now, I happen to be going to the Museum too, to see Doctor Norbury. I suppose that is another coincidence?'

'Certainly it is,' Miss Bellingham replied; and then she asked: 'Shall we walk together?' and the old curmudgeon actually said 'yes'—confound him!

We returned to the Gray's Inn Road, where, as there was now room for us to walk abreast, I proceeded to indemnify myself for the lawyer's unwelcome company by leading the conversation back to the subject of the missing man.

'Was there anything, Mr. Jellicoe, in Mr. John Bellingham's state of health that would make it probable that he might die suddenly?'

The lawyer looked at me suspiciously for a few moments and then remarked:

'You seem to be greatly interested in John Bellingham and his affairs.'

'I am. My friends are deeply concerned in them, and the case itself is of more than common interest from a professional point of view.'

'And what is the bearing of this particular question?'

'Surely it is obvious,' said I. 'If a missing man is known to have suffered from some affection, such as heart disease, aneurism, or arterial degeneration, likely to produce sudden death, that fact will surely be highly material to the question as to whether he is probably dead or alive.'

'No doubt you are right,' said Mr. Jellicoe. 'I have little knowledge of medical affairs, but doubtless you are right. As to the question itself, I am Mr. Bellingham's lawyer, not his doctor. His health is a matter that lies outside my jurisdiction.'
But you heard my evidence in Court, to the effect that the testator appeared, to my untutored observation, to be a healthy man. I can say no more now.'

'If the question is of any importance,' said Miss Bellingham, 'I wonder they did not call his doctor and settle it definitely. My own impression is that he was—or is—rather a strong and sound man. He certainly recovered very quickly and completely after his accident.'

'What accident was that?' I asked.

'Oh, hasn’t my father told you? It occurred while he was staying with us. He slipped from a kerb and broke one of the bones of the left ankle—somebody’s fracture—'

'Pott’s?'

'Yes; that was the name—Pott’s fracture; and he broke both his knee-caps as well. Sir Morgan Bennet had to perform an operation, or he would have been a cripple for life. As it was, he was about again in a few weeks, apparently none the worse excepting for a slight weakness of the left ankle.'

'Could he walk upstairs?' I asked.

'Oh, yes; and play golf and ride a bicycle.'

'You are sure he broke both knee-caps?'

'Quite sure. I remember that it was mentioned as an uncommon injury, and that Sir Morgan seemed quite pleased with him for doing it.'

'That sounds rather libellous; but I expect he was pleased with the result of the operation. He might well be.'

Here there was a brief lull in the conversation, and, even as I was trying to think of a poser for Mr. Jellicoe, that gentleman took the opportunity to change the subject.

'Are you going to the Egyptian rooms?' he asked.

'No,' replied Miss Bellingham; 'we are going to look at the pottery.'

'Old or modern?'

'That old Fulham ware is what chiefly interests us at present; that of the seventeenth century. I don’t know whether you call that ancient or modern.'

'Neither do I,' said Mr. Jellicoe. 'Antiquity and modernity are terms that have no fixed connotation. They are purely relative and their application in a particular instance has to be determined by a sort of sliding-scale. To a furniture collector, a Tudor chair or a Jacobean chest is ancient; to an architect, their period is modern, whereas an eleventh-century church is ancient; but to an Egyptologist, accustomed to remains of a vast antiquity, both are products of modern periods separated by an insignificant interval. And, I suppose,' he added reflectively, 'that to a geologist, the traces of the very earliest dawn of human history appertain only to the recent period. Conceptions of time, like all other conceptions, are relative.'

'You would appear to be a disciple of Herbert Spencer,' I remarked.

'I am a disciple of Arthur Jellicoe, sir,' he retorted. And I believed him.

By the time we had reached the Museum he had become almost genial; and, if less amusing in this frame, he was so much more instructive and entertaining that I refrained from baiting him, and permitted him to discuss his favourite topic unhindered, especially since my companion listened with lively interest. Nor, when we entered the great hall, did he relinquish possession of us, and we followed submissively, as he led the way past the winged bulls of Nineveh and the great seated statues, until we found ourselves, almost without the exercise of our volition, in the upper room amidst the glaring mummy cases that had witnessed the birth of my friendship with Ruth Bellingham.

'Before I leave you,' said Mr. Jellicoe, 'I should like to show you that mummy that we were discussing the other evening; the one, you remember, that my friend, John Bellingham, presented to the Museum a little time before his disappearance. The point that I mentioned is only a trivial one, but it may become of interest hereafter if any plausible explanation should be forthcoming.' He led us along the room until we arrived at the case containing John Bellingham’s gift, where he halted and gazed in at the mummy with the affectionate reflectiveness of the connoisseur.

'The bitumen coating was what we were discussing, Miss Bellingham,' said he. 'You have seen it, of course.'

'Yes,' she answered. 'It is a dreadful disfigurement, isn’t it?’

'Aesthetically it is to be deplored, but it adds a certain speculative interest to the specimen. You notice that the black coating leaves the principal decoration and the whole of the inscription untouched, which is precisely the part that one would expect to find covered up; whereas the feet and the back, which probably bore no writing, are quite thickly crusted. If you stoop down, you can see that the bitumen was daubed freely into the lacings of the back, where it served no purpose, so that even the strings are embedded.' He stooped as he spoke, and peered up inquisitively at the back of the mummy, where it was visible between the supports.

'Has Doctor Norbury any explanation to offer?’ asked Miss Bellingham.
'None whatever,' replied Mr. Jellicoe. 'He finds it as great a mystery as I do. But he thinks that we may get some suggestion from the Director when he comes back. He is a very great authority, as you know, and a practical excavator of great experience too. I mustn't stay here talking of these things, and keeping you from your pottery. Perhaps I have stayed too long already. If I have I ask your pardon, and I will now wish you a very good afternoon.' With a sudden return to his customary wooden impassivity, he shook hands with us, bowed stiffly, and took himself off towards the curator's office.

'What a strange man that is,' said Miss Bellingham, as Mr. Jellicoe disappeared through the doorway at the end of the room, 'or perhaps I should say, a strange being, for I can hardly think of him as a man. I have never met any other human creature at all like him.'

'He is certainly a queer old fogey,' I agreed.

'Yes, but there is something more than that. He is so emotionless, so remote and aloof from all mundane concerns. He moves among ordinary men and women, but as a mere presence, an unmoved spectator of their actions, quite dispassionate and impersonal.'

'Yes; he is astonishingly self-contained; in fact, he seems, as you say, to go to and fro among men, enveloped in a sort of infernal atmosphere of his own, like Marley's ghost. But he is lively and human enough as soon as the subject of Egyptian antiquities is broached.'

'Lively, but not human. He is always, to me, quite unhuman. Even when he is most interested, and even enthusiastic, he is a mere personification of knowledge. Nature ought to have furnished him with an ibis' head like Tahuti; then he would have looked his part.'

'He would have made a rare sensation in Lincoln's Inn if he had,' said I; and we both laughed heartily at the imaginary picture of Tahuti. Jellicoe, slender-beaked and top-hatted, going about his business in Lincoln's Inn and the Law Courts.

Insensibly, as we talked, we had drawn near to the mummy of Artemidorus, and now my companion halted before the case with her thoughtful grey eyes bent dreamily on the face that looked out at us. I watched her with reverent admiration. How charming she looked as she stood with her sweet, grave face turned so earnestly to the object of her mystical affection! How dainty and full of womanly dignity and grace! And then, suddenly it was borne in upon me that a great change had come over her since the day of our first meeting. She had grown younger, more girlish, and more gentle. At first she had seemed much older than I; a sad-faced woman, weary, solemn, enigmatic, almost gloomy, with a bitter, ironic humour and a bearing distant and cold. Now she was only maidenly and sweet; tinged, it is true, with a certain seriousness, but frank and gracious and wholly lovable.

Could the change be due to our friendship? As I asked myself the question, my heart leaped with a new hope. I yearned to tell her all that she was to me—all that I hoped we might be to one another in the years to come.

At length I ventured to break in upon her reverie.

'What are you thinking about so earnestly, fair lady?'

She turned quickly with a bright smile and sparkling eyes that looked frankly into mine. 'I was wondering,' said she, 'if he was jealous of my new friend. But what a baby I am to talk such nonsense!' She laughed softly and happily with just an adorable hint of shyness.

'Why should he be jealous?' I asked.

'Well, you see, before—we were friends, he had me all to himself. I have never had a man friend before—except my father—and no really intimate friend at all. And I was very lonely in those days, after our troubles had befallen. I am naturally solitary, but still, I am only a girl; I am not a philosopher. So when I felt very lonely, I used to come here and look at Artemidorus and make believe that he knew all the sadness of my life and sympathised with me. It was very silly, I know, but yet, somehow it was a real comfort to me.'

'It was not silly of you at all. He must have been a good man, a gentle, sweet-faced man who had won the love of those who knew him, as this beautiful memorial tells; and it was wise and good of you to sweeten the bitterness of your life with the fragrance of this human love that blossoms in the dust after the lapse of centuries. No, you were not silly, and Artemidorus is not jealous of your new friend.'

'Are you sure?' She still smiled as she asked the question, but was soft—almost tender—and there was a note of whimsical anxiety in her voice.

'Quite sure. I give you my confident assurance.' She laughed gaily.

'Yes, I remember,' she answered softly. 'It was when you were so sympathetic with my foolish whim that I felt we were really friends.'

'And I, when you confided your pretty fancy to me, thanked you for the gift of your friendship, and treasured it, and do still treasure it, above everything on earth.'
She looked at me quickly with a sort of nervousness in her manner, and cast down her eyes. Then, after a few moments' almost embarrassed silence, as if to bring back our talk to a less emotional plane, she said:

‘Do you notice the curious way in which this memorial divides itself up into two parts?’

‘How do you mean?’ I asked, a little disconcerted by the sudden descent.

‘I mean that there is a part of it that is purely decorative and a part that is expressive or emotional. You notice that the general design and scheme of decoration, although really Greek in feeling, follows rigidly the Egyptian conventions. But the portrait is entirely in the Greek manner, and when they came to that pathetic farewell, it—had to be spoken in their own tongue, written in their own familiar characters.’

‘Yes, I have noticed that and admired the taste with which they have kept the inscription so inconspicuous as not to clash with the decoration. An obtrusive inscription in Greek characters would have spoiled the consistency of the whole scheme.’

‘Yes, it would.’ She assented absentlly as if she were thinking of something else, and once more gazed thoughtfully at the mummy. I watched her with deep content; noted the lovely contour of her cheek, the soft masses of hair that stayed away so gracefully from her brow, and thought her the most wonderful creature that had ever trod the earth. Suddenly she looked at me reflectively.

‘I wonder,’ she said, ‘what made me tell you about Artemidorus. It was a rather silly, childish sort of make-believe, and I wouldn’t have told anyone else for the world; not even my father. How did I know that you would sympathise and understand?’

She asked the question in all simplicity with her serious grey eyes looking inquiringly into mine. And the answer came to me in a flash, with the beating of my own heart.

‘I will tell you how you know, Ruth,’ I whispered passionately. ‘It was because I loved you more than anyone else in the world has ever loved you, and you felt my love in your heart and called it sympathy.’

I stopped short, for she had blushed scarlet, and then turned deathly pale. And now she looked at me wildly, almost with terror.

‘Have I shocked you, Ruth dearest?’ I exclaimed penitently, ‘have I spoken too soon? If I have, forgive me. But I had to tell you. I have been eating my heart out for love of you for I don’t know how long. I think I have loved you from the first day we met. Perhaps I shouldn’t have spoken yet, but, Ruth dear, if you only knew what a sweet girl you are, you wouldn’t blame me.’

‘I don’t blame you,’ she said, almost in a whisper; ‘I blame myself. I have been a bad friend to you, who have been so loyal and loving to me. I ought not to have let this happen. For it can’t be, Paul; I can’t say what you want me to say. We can never be anything more to one another than friends.’

A cold hand seemed to grasp my heart—a horrible fear that I had lost all that I cared for—all that made life desirable. ‘Why can’t we?’ I asked. ‘Do you mean that—that the gods have been gracious to some other man?’

‘No, no,’ she answered hastily—almost indignantly, ‘of course I don’t mean that.’

‘Then it is only that you don’t love me yet. Of course you don’t. Why should you? But you will, dear, some day. And I will wait patiently until that day comes and not trouble you with entreaties. I will wait for you as Jacob waited for Rachel; and as the long years seemed to him but as a few days because of the love he bore her, so it shall be with me, if only you will not send me away quite without hope.’

She was looking down, white-faced, with a hardening of the lips as if she were in bodily pain. ‘You don’t understand,’ she whispered. ‘It can’t be—it can never be. There is something that makes it impossible, now and always. I can’t tell you more than that.’

But, Ruth dearest,’ I pleaded despairingly, ‘may it not become possible some day? Can it not be made possible? I can wait, but I can’t give you up. Is there no chance whatever that this obstacle may be removed?’

‘Very little, I fear. Hardly any. No, Paul; it is hopeless, and I can’t bear to talk about it. Let me go now. Let us say goodbye here and see one another no more for a while. Perhaps we may be friends again some day—when you have forgiven me.’

‘Forgiven you, dearest!’ I exclaimed. ‘There is nothing to forgive. And we are friends, Ruth. Whatever happens, you are the dearest friend I have on earth, or can ever have.’

‘Thank you, Paul,’ she said faintly. ‘You are very good to me. But let me go, please. I must be alone.’

4 She held out a trembling hand, and, as I took it, I was shocked to see how terribly agitated and ill she looked.

‘May I not come with you, dear?’ I pleaded.

‘No, no!’ she exclaimed breathlessly; ‘I must go away by myself. I want to be alone. Good-bye.’

‘Before I let you go, Ruth—if you must go—I must have a most solemn promise from you.’

Her sad grey eyes met mine and her lips quivered with an unspoken question.
‘You must promise me,’ I went on, ‘that if ever this barrier that parts us should be removed, you will let me know instantly. Remember that I love you always, and that I am waiting for you always on this side of the grave.’

She caught her breath in a quick little sob, and pressed my hand.

‘Yes,’ she whispered: ‘I promise. Good-bye.’

She pressed my hand again and was gone; and, as I gazed at the empty doorway through which she had passed, I caught a glimpse of her reflection in a glass on the landing, where she had paused for a moment to wipe her eyes. I felt it, in a manner, indelicate to have seen her, and turned away my head quickly; and yet I was conscious of a certain selfish satisfaction in the sweet sympathy that her grief bespoke.

But now that she was gone a horrible sense of desolation descended on me. Only now, by the consciousness of irreparable loss, did I begin to realise the meaning of this passion of love that had stolen unawares into my life. How it had glorified the present and spread a glamour of delight over the dimly considered future: how all pleasures and desires, hopes and ambitions, had converged upon it as a focus; how it had stood out as the one great reality behind which the other circumstances of life were as a background, shimmering, half seen, immaterial and unreal. And now it was gone—lost, as it seemed, beyond hope; and that which was left to me was but the empty frame from which the picture had vanished.

I have no idea how long I stood rooted to the spot where she had left me, wrapped in a dull consciousness of pain, immersed in a half-numb reverie. Recent events flitted, dream-like, through my mind; our happy labours in the reading-room; our first visit to the Museum; and this present day that had opened so brightly and with such joyous promise. One by one these phantoms of a vanished happiness came and went. Occasional visitors sauntered into the room—but the galleries were mostly empty that day—gazed inquisitively at my motionless figure, and went their way. And still the dull, intolerable ache in my breast went on, the only vivid consciousness that was left to me.

Presently I raised my eyes and met those of the portrait. The sweet, pensive face of the old Greek settler looked out at me wistfully as though he would offer comfort; as though he would tell me that he, too, had known sorrow when he lived his life in the sunny Fayyum. And a subtle consolation, like the faint scent of old rose leaves, seemed to exhale from that friendly face that had looked on the birth of my happiness and had seen it wither and fade. I turned away, at last, with a silent farewell; and when I looked back, he seemed to speed me on my way with gentle valediction.

———

XVII.—THE ACCUSING FINGER

OF my wanderings after I left the Museum on that black and dismal dies irae, I have but a dim recollection. But I must have travelled a quite considerable distance, since it wanted an hour or two to the time for returning to the surgery, and I spent the interval walking swiftly through streets and squares, unmindful of the happenings around, intent only on my present misfortune, and driven by a natural impulse to seek relief in bodily exertion. For mental distress sets up, as it were, a sort of induced current of physical unrest; a beneficent arrangement, by which a dangerous excess of emotional excitement may be transformed into motor energy, and so safely got rid of. The motor apparatus acts as a safety-valve to the psychical; and if the engine races for a while, with the onset of a bodily fatigue the emotional pressure-gauge returns to a normal reading.

And so it was with me. At first I was conscious of nothing but a sense of utter bereavement, of the shipwreck of all my hopes. But, by degrees, as I threaded my way among the moving crowds, I came to a better and more worthy frame of mind. After all, I had lost nothing that I had ever had. Ruth was still all that she had ever been to me—perhaps even more; and if that had been a rich endowment yesterday, why not to-day also? And how unfair it would be to her if I should mope and grieve over a disappointment that was no fault of hers and for which there was no remedy! Thus I reasoned with myself, and to such purpose that, by the time I reached Fetter Lane, my dejection had come to quite manageable proportions and I had formed the resolution to get back to the status quo ante helium as soon as possible.

About eight o’clock, as I was sitting alone in the consulting-room, gloomily persuading myself that I was now quite resigned to the inevitable, Adolphus brought me a registered packet, at the handwriting on which my heart gave such a bound that I had much ado to sign the receipt. As soon as Adolphus had retired (with undissembled contempt of the shaky signature) I tore open the packet, and as I drew out a letter a tiny box dropped on the table.

The letter was all too short, and I devoured it over and over again with the eagerness of a condemned man reading a reprieve:

‘MY DEAR PAUL.

‘Forgive me for leaving you so abruptly this afternoon, and leaving you so unhappy, too. I am more sane and reasonable now, and so send you greeting and beg you not to grieve for that which can never be. It is quite impossible, dear friend, and I entreat you, as you care for me, never speak of it again; never again to make me feel that I can give you so little when you have given so much. And do not try to see me for a little while. I shall miss your visits, and so will my father, who is very fond of you; but it is better that we should not meet, until we can take up our old relations—if that can ever be.

‘I am sending you a little keepsake in case we should drift apart on the eddies of life. It is the ring that I told you about—the one that my uncle save me. Perhaps you may be able to wear it as you have a small hand, but in any case keep it in remembrance of our friendship. The device on it is the Eye of Osiris, a mystic symbol for which I have a sentimentally
superstitious affection, as also had my poor uncle, who actually bore it tattooed in scarlet on his breast. It signifies that the great judge of the dead looks down on men to see that justice is done and that truth prevails. So I commend you to the good Osiris; may his eye be upon you, ever watchful over your welfare in the absence of

‘Your affectionate friend.

‘RUTH.’

It was a sweet letter, I thought, even if it carried little comfort; quiet and reticent like its writer, but with an undertone of affection. I laid it down at length, and, taking the ring from its box, examined it fondly. Though but a copy, it had all the quaintness and feeling of the antique original, and, above all, it was fragrant with the spirit of the giver. Dainty and delicate, wrought of silver and gold, with an inlay of copper, I would not have exchanged it for the Koh-i-noor; and when I had slipped it on my finger its tiny eye of blue enamel looked up at me so friendly and companionable that I felt the glamour of the old-world superstitition stealing over me too.

Not a single patient came in this evening, which was well for me (and also for the patient), as I was able forthwith to write in reply a long letter; but this I shall spare the long-suffering reader excepting its concluding paragraph:

‘And now, dearest, I have said my say; once for all I have said it, and I will not open my mouth on the subject again (I am not actually opening it now) “until the times do alter”. And if the times do never alter

—if it shall come to pass, in due course, that we two shall sit side by side, white-haired, and crinkly-nosed, and lean our poor old chins upon our sticks and mumble and gibber amicably over the things that might have been if the good Osiris had come up to the scratch—I will still be content, because your friendship, Ruth, is better than another woman’s love. So you see, I have taken my gruel and come up to lime smiling—if you will pardon the pugilistic metaphor—and I promise you loyally to do your bidding and never again to distress you.’

‘Your faithful and loving friend.

Paul.’

This letter I addressed and stamped, and then, with a wry grimace which I palmed off on myself (but not on Adolphus) as a cheerful smile, I went out and dropped it into the post-box; after which I further deluded myself by murmuring Nunc dimittis and assuring myself that the incident was now absolutely closed.

But despite this comfortable assurance I was, in the days that followed, an exceedingly miserable young man. It is all very well to write down troubles of this kind as trivial and sentimental. They are nothing of the kind. When a man of essentially serious nature has found the one woman of all the world who fulfils his highest ideals of womanhood, who is, in fact, a woman in ten thousand, to whom he has given all that he has to give of love and worship, the sudden wreck of all his hopes is no small calamity. And so I found it. Resign myself as I would to the bitter reality, the ghost of the might-have-been haunted me night and day, so that I spent my leisure wandering abstractedly about the streets, always trying to banish thought and never for an instant succeeding. A great unrest was upon me; and when I received a letter from Dick Barnard announcing his arrival at Madeira, homeward bound, I breathed a sigh of relief. I had no plans for the future, but I longed to be rid of the now irksome, routine of the practice—to be free to come and go when and how I pleased.

One evening, as I sat consuming with little appetite my solitary supper, there fell on me a sudden sense of loneliness. The desire that I had hitherto felt to be alone with my own miserable reflections gave place to a yearning for human companionship. That, indeed, which I craved for most was forbidden, and I must abide by my lady’s wishes; but there were my friends in the Temple. It was more than a week since I had seen them; in fact, we had not met since the morning of that unhappiest day of my life. They would be wondering what had become of me. I rose from the table, and having filled my pouch from a tin of tobacco, set forth for King’s Bench Walk.

As I approached the entry of No. 5A in the gathering darkness I met Thorndyke himself emerging encumbered with two deck-chairs, a reading-lantern, and a book.

‘Why, Berkeley!’ he exclaimed, ‘is it indeed thou? We have been wondering what had become of you.’

‘It is a long time since I looked you up,’ I admitted.

He scrutinised me attentively by the light of the entry lamp, and then remarked: ‘Fetter Lane doesn’t seem to be agreeing with you very well, my son. You are looking quite thin and peaty.’

‘Well, I’ve nearly done with it. Barnard will be back in about ten days. His ship is putting in at Madeira to coal and take in some cargo, and then he is coming home. Where are you going with those chairs?’

‘I am going to sit down at the end of the Walk by the railings. It’s cooler there than indoors. If you will wait a moment I will go and fetch another chair for Jervis, though he won’t be back for a little while.’ He ran up the stairs, and presently returned with a third chair, and we carried our impedimenta down to the quiet corner of the Walk.

‘So your term of servitude is coming to an end,’ said he, when we had placed the chairs and hung the lantern on the railings. ‘Any other news?’

‘No. Have you any?’

‘I am afraid I have not. All my inquiries have yielded negative results. There is, of course, a considerable body of
evidence, and it all seems to point one way. But I am unwilling to make a decisive move without something more definite. I am really waiting for confirmation or otherwise of my ideas on the subject; for some new item of evidence.'

'I didn't know there was any evidence.'

'Didn't you?' said Thorndyke. 'But you know as much as I know. You have all the essential facts; but apparently you haven't collated them and extracted their meaning. If you had, you would have found them curiously significant.'

'I suppose I mustn't ask what their significance is?' No, I think not. When I am conducting a case I mention my surmises to nobody—not even to Jervis. Then I can say confidently that there has been no leakage. Don't think I distrust you. Remember that my thoughts are my client's property, and that the essence of strategy is to keep the enemy in the dark.'

'Yes, I see that. Of course I ought not to have asked.'

'You ought not to need to ask,' Thorndyke replied, with a smile; 'you should put the facts together and reason from them yourself.'

While we had been talking I had noticed Thorndyke glance at me inquisitively from time to time. Now after an interval of silence, he asked suddenly:

'Is anything amiss, Berkeley? Are you worrying about your friends' affairs?'

'No, not particularly; though their prospects don't look very rosy.' Perhaps they are not quite so bad as they look,' said he. 'But I am afraid something is troubling you. All your gay spirits seem to have evaporated.' He paused for a few moments, and then added: 'I don't want to intrude on your private affairs, but if I can help you by advice or otherwise, remember that we are old friends and that you are my academic offspring.'

Instinctively, with a man's natural reticence, I began to mumble a half-articulate disclaimer; and then I stopped. After all, why should I not confide in him? He was a good man and a wise man, full of human sympathy, as I knew, though so cryptic and secretive in his professional capacity. And I wanted a friend badly just now.

'I'm afraid,' I began shyly, 'it is not a matter that admits of much help, and it's hardly the sort of thing that I ought to worry you by talking about—'

'If it is enough to make you unhappy, my dear fellow, it is enough to merit serious consideration by your friend; so if you don't mind telling me—'

'Of course I don't, sir!' I exclaimed.

'Then fire away; and don't call me "sir." We are brother practitioners just now.'

Thus encouraged, I poured out the story of my little romance; bashfully at first and with halting phrases, but later, with more freedom and confidence. He listened with grave attention, and once or twice put a question when my narrative became a little disconnected. When I had finished he laid his hand softly on my arm.

'You have had rough luck, Berkeley. I don't wonder that you are miserable. I am more sorry than I can tell you.'

'Thank you,' I said. 'It's exceedingly good of you to listen so patiently, but it's a shame for me to pester you with my sentimental troubles.'

'Now, Berkeley, you don't think that, and I hope you don't think that I do. We should be bad biologists and worse physicians if we should underestimate the importance of that which is nature's chiefest care. The one salient biological truth is the paramount importance of sex; and we are deaf and blind if we do not hear and see it in everything that lives when we look abroad upon the world; when we listen to the spring song of the birds, or when we consider the lilies of the field. And as is man to the lower organisms, so is human love to their merely reflex manifestations of sex. I will maintain, and you will agree with me, I know, that the love of a serious and honourable man for a woman who is worthy of him is the most momentous of all human affairs. It is the foundation of social life, and its failure is a serious calamity, not only to those whose lives may be thereby spoilt, but to society at large.'

'It's a serious enough matter for the parties concerned,' I agreed; 'but that is no reason why they should bore their friends.'

'But they don't. Friends should help one another and think it a privilege.'

'Oh, I shouldn't mind coming to you for help, knowing you as I do. But no one can help a poor devil in a case like this—and certainly not a medical jurist.'

'Oh, come, Berkeley!' he protested, 'don't rate us too low. The humblest of creatures has its uses—"even the little pismire," you know, as Isaak Walton tells us. Why, I have got substantial help from a stamp-collector. And then reflect upon the motor-scorcher and the earth-worm and the blow-fly. All these lowly creatures play their parts in the scheme of nature; and shall we cast out the medical jurist as nothing worth?'

I laughed dejectedly at my teacher's genial irony.

What I meant,' said I, 'was that there is nothing to be done but wait—perhaps for ever. I don't know why she isn't able to marry me, and I mustn't ask her. She can't be married already.'

'Certainly not. She told you explicitly that there was no man in the case.'
‘Exactly. And I can think of no other valid reason, excepting that she doesn’t care enough for me. That would be a perfectly sound reason, but then it would only be a temporary one, not the insuperable obstacle that she assumes to exist, especially as we really got on excellently together. I hope it isn’t some confounded perverse feminine scruple. I don’t see how it could be; but women are most frightfully tortuous and wrong-headed at times.’

‘I don’t see,’ said Thorndyke, ‘why we should cast about for perversely abnormal motives when there is a perfectly reasonable explanation staring us in the face.’

Us there?’ I exclaimed. ‘I see none.’

‘You are, not unnaturally, overlooking some of the circumstances that affect Miss Bellingham; but I don’t suppose she has failed to grasp their meaning. Do you realise what her position really is? I mean with regard to her uncle’s disappearance?’

‘I don’t think I quite understand you.’

‘Well, there is no use in blinking the facts,’ said Thorndyke. ‘The position is this: if John Bellingham ever went to his brother’s house at Woodford, it is nearly certain that he went there after his visit to Hurst. Mind, I say “if he went”; I don’t say that I believe he did. But it is stated that he appears to have gone there; and if he did go, he was never seen alive afterwards. Now, he did not go in at the front door. No one saw him enter the house. But there was a back gate, which John Bellingham knew, and which had a bell which rang in the library. And you will remember that, when Hurst and Jellicoe called, Mr. Bellingham had only just come in. Previous to that time Miss Bellingham had been alone in the library; that is to say, she was alone in the library at the very time when John Bellingham is said to have made his visit. That is the position, Berkeley. Nothing pointed has been said up to the present. But, sooner or later, if John Bellingham is not found, dead or alive, the question will be opened. Then it is certain that Hurst, in self-defence, will make the most of any facts that may transfer suspicion from him to some one else. And that some one else will be Miss Bellingham.’

I sat for some moments literally paralysed with horror. Then my dismay gave place to indignation. ‘But, damn it!’ I exclaimed, starting up—‘I beg your pardon—but could anyone have the infernal audacity to insinuate that that gentle, refined lady murdered her uncle?’

‘That is what will be hinted, if not plainly asserted; and she knows it. And that being so, is it difficult to understand why she should refuse to allow you to be publicly associated with her? To run the risk of dragging your honourable name into the sordid transactions of the police-court or the Old Bailey? To invest it, perhaps, with a dreadful notoriety?’

‘Oh, don’t! for God’s sake! It is too horrible! Not that I would care for myself. I would be proud to share her martyrdom of ignominy, if it had to be; but it is the sacrilege, the blasphemy of even thinking of her in such terms, that enrages me.’

‘Yes,’ said Thorndyke; ‘I understand and sympathise with you. Indeed, I share your righteous indignation at this dastardly affair. So you mustn’t think me brutal for putting the case so plainly.’

‘I don’t. You have only shown me the danger that I was fool enough not to see. But you seem to imply that this hideous position has been brought about deliberately.’

‘Certainly I do! This is no chance affair. Either the appearances indicate the real events—which I am sure they do not—or they have been created of a set purpose to lead to false conclusions. But the circumstances convince me that there has been a deliberate plot; and I am waiting—in no spirit of Christian patience, I can tell you—to lay my hand on the wretch who has done this.’

‘What are you waiting for?’ I asked.

‘I am waiting for the inevitable,’ he replied; ‘for the false move that the most artful criminal invariably makes. At present he is lying low; but presently he will make a move, and then I shall have him.’

‘But he may go on lying low. What will you do then?’

‘Yes, that is the danger. We may have to deal with the perfect villain who knows when to leave well alone. I have never met him, but he may exist, nevertheless.’

‘And then we should have to stand by and see our friends go under.’

‘Perhaps,’ said Thorndyke; and we both subsided into gloomy and silent reflection.

The place was peaceful and quiet, as only a backwater of London can be. Occasional hoots from far-away tugs and steamers told of the busy life down below in the crowded Pool. A faint hum of traffic was borne in from the streets outside the precincts, and the shrill voices of newspaper boys came in unceasing chorus from the direction of Carmelite Street. They were too far away to be physically disturbing, but the excited yells, toned down as they were by distance, nevertheless stirred the very marrow in my bones, so dreadfully suggestive were they of those possibilities of the future at which Thorndyke had hinted. They seemed like the sinister shadows oncoming misfortunes.

Perhaps they called up the same association of ideas in Thorndyke’s mind, for he remarked presently: ‘The newsvendor is abroad to-night like a bird of ill-omen. Something unusual has happened: some public or private calamity, most likely, and these yelling ghouls are out to feast on the remains. The newspaper men have a good deal in common with the carrion-birds that hover over a battle-field.’
Again we subsided into silence and reflection. Then, after an interval, I asked:

‘Would it be possible for me to help in any way in this investigation of yours?’

‘That is exactly what I have been asking myself,’ replied Thorndyke. ‘It would be right and proper that you should, and I think you might.’

‘How?’ I asked eagerly.

‘I can’t say off-hand; but Jervis will be going away for his holiday almost at once—in fact, he will go off actual duty tonight. There is very little doing; the long vacation is close upon us, and I can do without him. But if you would care to come down here and take his place, you would be very useful to me; and if there should be anything to be done in the Bellinghams’ case, I am sure you would make up in enthusiasm for any deficiency in experience.’

‘I couldn’t really take Jervis’s place,’ said I, ‘but if you would let me help you in any way it would be a great kindness. I would rather clean your boots than be out of it altogether.’

‘Very well. Let us leave it that you come here as soon as Barnard has done with you. You can have Jervis’s room, which he doesn’t often use nowadays, and you will be more happy here than elsewhere, I know. I may as well give you my latch-key now. I have a duplicate upstairs, and you understand that my chambers are yours too from this moment.’

He handed me the latch-key and I thanked him warmly from my heart, for I felt sure that the suggestion was made, not for any use that I should be to him, but for my own peace of mind. I had hardly finished speaking when a quick step on the paved walk caught my ear.

‘Here is Jervis,’ said Thorndyke. ‘We will let him know that there is a locum tenens ready to step into his shoes when he wants to be off.’ He flashed the lantern across the path, and a few moments later his junior stepped up briskly with a bundle of newspapers tucked under his arm.

It struck me that Jervis looked at me a little queerly when he recognised me in the dim light; also he was a trifle constrained in his manner, as if my presence were an embarrassment. He listened to Thorndyke’s announcement of our newly made arrangement without much enthusiasm and with none of his customary facetious comments. And again I noticed a quick glance at me, half curious, half uneasy, and wholly puzzling to me.

‘That’s all right,’ he said when Thorndyke had explained the situation. ‘I daresay you’ll find Berkeley as useful as me, and, in any case, he will be better here than staying on with Barnard.’ He spoke with unwonted gravity, and there was in his tone a solicitude for me that attracted my notice and that of Thorndyke as well, for the latter looked at him curiously, though he made no comment. After a short silence, however, he asked: ‘And what news does my learned brother bring? There is a mighty shouting among the outer barbarians and I see a bundle of newspapers under my learned friend’s arm. Has anything in particular happened?’

Jervis looked more uncomfortable than ever. ‘Well—yes,’ he replied hesitatingly, ‘something has happened—there! It’s no use beating about the bush; Berkeley may as well learn it from me as from those yelling devils outside.’ He took a couple of papers from his bundle and silently handed one to me and the other to Thorndyke.

Jervis’s ominous manner, naturally enough, alarmed me not a little. I opened the paper with a nameless dread. But whatever my vague fears, they fell far short of the occasion; and when I saw those yells from without crystallised into scare head-lines and flaming capitals I turned for a moment sick and dizzy with fear.

The paragraph was only a short one, and I read it through in less than a minute.

‘THE MISSING FINGER

DRAMATIC DISCOVERY AT WOODFORD’

‘The mystery that has surrounded the remains of a mutilated human body, portions of which have been found in various places in Kent and Essex, has received a partial and very sinister solution. The police have, all along, suspected that those remains were those of a Mr. John Bellingham who disappeared under circumstances of some suspicion about two years ago. There is now no doubt upon the subject, for the finger which was missing from the hand that was found at Sidecup has been discovered at the bottom of a disused well together with a ring, which has been identified as one habitually worn by Mr. John Bellingham.

‘The house in the garden of which the well is situated was the property of the murdered man, and was occupied at the time of the disappearance by his brother, Mr. Godfrey Bellingham. But the latter left it very soon after, and it has been empty ever since. Just lately it has been put in repair, and it was in this way that the well came to be emptied and cleaned out. It seems that Detective-Inspector Badger, who was searching the neighbourhood for further remains, heard of the emptying of the well and went down in the bucket to examine the bottom, where he found the three bones and the ring.

‘Thus the identity of the body is established beyond all doubt, and the question that remains is, Who killed John Bellingham? It may be remembered that a trinket, apparently broken from his watch-chain, was found in the grounds of this house on the day that he disappeared, and that he was never again seen alive. What may be the import of these facts time will show.’

That was all; but it was enough. I dropped the paper to the ground and glanced round furtively at Jervis, who sat gazing gloomily at the toes of his boots. It was horrible! It was incredible! The blow was so crushing that it left my faculties numb,
and for a while I seemed unable even to think intelligibly.

I was aroused by Thorndyke’s voice—calm, businesslike, composed:

‘Time will show, indeed! But meanwhile we must go warily. And don’t be unduly alarmed, Berkeley. Go home, take a good dose of bromide with a little stimulant, and turn in. I am afraid this has been rather a shock to you.’

I rose from my chair like one in a dream and held out my hand to Thorndyke; and even in the dim light and in my dazed condition I noticed that his face bore a look that I had never seen before; the look of a granite mask of Fate—grim, stern, inexorable.

My two friends walked with me as far as the gateway at the top of Inner Temple Lane, and as we reached the entry a stranger, coming quickly up the Lane, overtook and passed us. In the glare of the lamp outside the porter’s lodge he looked at us quickly over his shoulder, and though he passed on without halt or greeting, I recognised him with a certain dull surprise which I did not understand then and do not understand now. It was Mr. Jellicoe.

I shook hands once more with my friends and strode out into Fleet Street, but as soon as I was outside the gate I made direct for Nevill’s Court. What was in my mind I do not know; only that some instinct of protection led me there, where my lady lay unconscious of the hideous menace that hung over her. At the entrance to the Court a tall, powerful man was lounging against the wall, and he seemed to look at me curiously as I passed; but I hardly noticed him and strode forward into the narrow passage. By the shabby gateway of the house I halted and looked up at such of the windows as I could see over the wall. They were all dark. All the inmates, then, were in bed. Vaguely comforted by this, I walked on to the New Street end of the Court and looked out. Here, too, a man—a tall, thick-set man—was loitering; and as he looked inquisitively into my face I turned and re-entered the Court, slowly retracing my steps. As I again reached the gate of the house I stopped to look once more at the windows, and turning I found the man whom I had last noticed close behind me. Then, in a flash of dreadful comprehension, I understood. These two were plain-clothes policemen.

For a moment a blind fury possessed me. An insane impulse urged me to give battle to this intruder; to avenge upon this person the insult of his presence. Fortunately the impulse was but momentary, and I recovered myself without making any demonstration. But the appearance of those two policemen brought the peril into the immediate present, imparted to it a horrible actuality. A chilly sweat of terror stood on my forehead, and my ears were ringing when I walked with faltering steps out into Fetter Lane.

XVIII. — JOHN BELLINGHAM

THE next few days were a very nightmare of horror and gloom. Of course, I repudiated my acceptance of the decree of banishment that Ruth had passed upon me. I was her friend, at least, and in time of peril my place was at her side. Tacitly —though thankfully enough, poor girl!—she had recognised the fact and made me once more free of the house.

For there was no disguising the situation. Newspaper boys yelled the news up and down Fleet Street from morning to night; soul-shaking posters grinned on gaping crowds; and the newspapers fairly wallowed in the ‘Shocking details.’

It is true that no direct accusations were made; but the original reports of the disappearance were reprinted with such comments as made me gnash my teeth with fury.

The wretchedness of those days will live in my memory until my dying day. Never can I forget the dread that weighed me down, the horrible suspense, the fear that clutched at my heart as I furtively scanned the posters in the streets. Even the wretched detectives who prowled about the entrances to Nevill’s Court became grateful to my eyes, for, embodying as they did the hideous menace that hung over my dear lady, their presence at least told me that the blow had not yet fallen. Indeed, we came, after a time, to exchange glances of mutual recognition, and I thought that they seemed to be sorry for her and for me, and had no great liking for their task. Of course, I spent most of my leisure at the old house, though my heart ached more there than elsewhere; and I tried, with but poor success, I fear to maintain a cheerful, confident manner, cracking my little jokes as of old, and even essaying to skirmish with Miss Oman. But this last experiment was a dead failure; and when she had suddenly broken down in a stream of brilliant repartee to weep hysterically on my breast, I abandoned the attempt and did not repeat it.

A dreadful gloom had settled down upon the old house. Poor Miss Oman crept silently but restless up and down the ancient stairs with dim eyes and a tremulous chin, or moped in her room with a parliamentary petition (demanding, if I remember rightly, the appointment of a female judge to deal with divorce and matrimonial causes) which lay on her table languidly awaiting signatures that never came. Mr. Bellingham, whose mental condition at first alternated between furious anger and absolute panic, was fast sinking into a state of nervous prostration that I viewed with no little alarm. In fact, the only really self-possessed person in the entire household was Ruth herself, and even she could not conceal the ravages of sorrow and suspense and overshadowing peril. Her manner was almost unchanged; or rather, I should say, she had gone back to that which I had first known—quiet, reserved, taciturn, with a certain bitter humour showing through her unvarying amiability. When she and I were alone, indeed, her reserve melted away and she was all sweetness and gentleness. But it wrung my heart to look at her, to see how, day by day, she grew ever more thin and haggard; to watch the growing pallor of her cheek; to look into her solemn grey eyes, so sad and tragic and yet so brave and defiant of fate.

It was a terrible time; and through it all the dreadful questions haunted me continually: When will the blow fall? What is
it that the police are waiting for? And when they do strike, what will Thorndyke have to say?

So things went on for four dreadful days. But on the fourth day, just as the evening consultations were beginning and the surgery was filled with waiting patients, Polton appeared with a note, which he insisted, to the indignation of Adolphus, on delivering into my own hands. It was from Thorndyke, and was to the following effect:

‘I learn from Dr. Norbury that he has recently heard from Hen Lederbogen, of Berlin—a learned authority on Oriental antiquities—who makes some reference to an English Egyptologist whom he met in Vienna about a year ago. He cannot recall the Englishman’s name, but there are certain expressions in the letter which make Dr. Norbury suspect that he is referring to John Bellingham.’

‘I want you to bring Mr. and Miss Bellingham to my chambers this evening at 8.30, to meet Dr. Norbury and talk over his letter; and in view of the importance of the matter, I look to you not to fail me.’

A wave of hope and relief swept over me. It was still possible that this Gordian knot might be cut; that the deliverance might not come before it was too late. I wrote a hasty note to Thorndyke and another to Ruth, making the appointment; and having given them both to the trustworthy Polton, returned somewhat feverishly to my professional duties. To my profound relief, the influx of patients ceased, and the practice sank into its accustomed torpor; whereby I was able without base and mendacious subterfuge to escape in good time to my tryst.

It was near upon eight o’clock when I passed through the archway into Nevill’s Court. The warm afternoon light had died away, for the summer was running out apace. The last red glow of the setting sun had faded from the ancient roofs and chimney stacks, and down in the narrow court the shades of evening had begun to gather in nooks and corners. I was due at eight, and, as it still wanted some minutes to the hour, I sauntered slowly down the Court, looking reflectively on the familiar scene and the well-known friendly faces.

The day’s work was drawing to a close. The little shops were putting up their shutters; lights were beginning to twinkle in parlour windows; a solemn hymn arose in the old Moravian chapel, and its echoes stole out through the dark entry that opens into the court under the archway.

Here was Mr. Finneymore (a man of versatile gifts, with a leaning towards paint and varnish) sitting, white-aproned and shirt-sleeved, on a chair in his garden, smoking his pipe with a complacent eye on his dahlias. There at an open window a young man, with a brush in his hand and another behind his ear, stood up and stretched himself while an older lady deftly rolled up a large map. The barber was turning out the gas in his little saloon; the greengrocer was emerging with a cigarette in his mouth and an aster in his button-hole, and a group of children were escorting the lamp-lighter on his rounds.

All these good, homely folk were Nevill’s Courtiers of the genuine breed’ born in the court, as had been their fathers before them for generations. And of such to a great extent was the population of the place. Miss Oman herself claimed aboriginal descent and so did the sweet-faced Moravian lady next door—a connection of the famous La Trobes of the old Conventicle, whose history went back to the Gordon Riots; and as to the gentleman who lived in the ancient timber-and-plaster house at the bottom of the court, it was reported that his ancestors had dwelt in that very house since the days of James the First.

On these facts I reflected as I sauntered down the court, on the strange phenomenon of an old-world hamlet with its ancient population lingering in the very heart of the noisy city; an island of peace set in an ocean of unrest, an oasis in a desert of change and ferment.

My meditations brought me to the shabby gate in the high wall, and as I raised the latch and pushed it open, I saw Ruth standing at the door of the house talking to Miss Oman. She was evidently waiting for me, for she wore her sombre black coat and hat and a black veil, and when she saw me she came out, closing the door after her, and holding out her hand.

‘You are punctual,’ said she. ‘St Dunstan’s clock is striking now.’

‘Yes,’ I answered. ‘But where is your father?’

‘He has gone to bed, poor old dear. He didn’t feel well enough to come, and I did not urge him. He is really very ill. This dreadful suspense will kill him if it goes on much longer.’

‘Let us hope it won’t,’ I said, but with little conviction, I fear, in my tone.

It was harrowing to see her torn by anxiety for her father, and I yearned to comfort her. But what was there to say? Mr. Bellingham was breaking up visibly under the stress of the terrible menace that hung over his daughter, and no words of mine could make the fact less manifest.

We walked silently up the court. The lady at the window greeted us with a smiling salutation, Mr. Finneymore removed his pipe and raised his cap, receiving a gracious bow from Ruth in return, and then we passed through the covered way into Fetter Lane, where my companion paused and looked about her.

‘What are you looking for?’ I asked.

‘The detective,’ she answered quietly. ‘It would be a pity if the poor man should miss me after waiting so long. However, I don’t see him.’ And she turned away towards Fleet Street. It was an unpleasant surprise to me that her sharp eyes detected the secret spy upon her movements; and the dry, sardonic tone of her remark pained me too, recalling, as it did, the frigid self-possession that had so repelled me in the early days of our acquaintance. And yet I could not but admire the cool
unconcern with which she faced her horrible peril.

'Tell me a little more about this conference,' she said, as we walked down Fetter Lane. 'Your note was rather more concise than lucid; but I suppose you wrote it in a hurry.'

'Yes, I did. And I can't give you any details now. All I know is that Doctor Norbury has had a letter from a friend of his in Berlin, an Egyptologist, as I understand, named Lederbogen, who refers to an English acquaintance of his and Norbury's whom he saw in Vienna about a year ago. He cannot remember the Englishman's name, but from some of the circumstances Norbury seems to think that he is referring to your Uncle John. Of course, if this should turn out to be really the case, it would set everything straight; so Thorndyke was anxious that you and your father should meet Norbury and talk it over.'

'I see,' said Ruth. Her tone was thoughtful but by no means enthusiastic.

'You don't seem to attach much importance to the matter,' I remarked.

'No. It doesn't seem to fit the circumstances. What is the use of suggesting that poor Uncle John is alive—and behaving like an imbecile, which he certainly was not—when his dead body has actually been found?'

'But,' I suggested lamely, 'there may be some mistake. It may not be his body after all.'

'And the ring?' she asked, with a bitter smile.

'That may be just a coincidence. It was a copy of a well-known form of antique ring. Other people may have had copies made as well as your uncle. Besides,' I added with more conviction, 'we haven't seen the ring. It may not be his at all.'

She shook her head. 'My dear Paul,' she said quietly, 'it is useless to delude ourselves. Every known fact points to the certainty that it is his body. John Bellingham is dead: there can be no doubt of that. And to every one except his unknown murderer and one or two of my own loyal friends, it must seem that his death lies at my door. I realised from the beginning that the suspicion lay between George Hurst and me; and the finding of the ring fixes it definitely on me. I am only surprised that the police have made no move yet.'

The quiet conviction of her tone left me for a while speechless with horror and despair. Then I recalled Thorndyke's calm, even confident, attitude, and I hastened to remind her of it.

'There is one of your friends,' I said, 'who is still undismayed. Thorndyke seems to anticipate no difficulties.'

'And yet,' she replied, 'he is ready to consider a forlorn hope like this. However, we shall see.'

I could think of nothing more to say, and it was in gloomy silence that we pursued our way down Inner Temple Lane and through the dark entries and tunnel-like passages that brought us out, at length, by the Treasury.

'I don't see any light in Thorndyke's chambers,' I said, as we crossed King's Bench Walk; and I pointed out the row of windows all dark and blank.

'No; and yet the shutters are not closed. He must be out.'

'He can't be after making an appointment with you and your father. It is most mysterious. Thorndyke is so very punctilious about his engagements.

The mystery was solved, when we reached the landing, by a slip of paper fixed by a tack on the iron-bound 'oak.'

'A note for P. B. is on the table,' was the laconic message: on reading which I inserted my key, swung the heavy door outward, and opened the lighter inner door. The note was lying on the table and I brought it out to the landing to read by the light of the staircase lamp.

'Apologise to our friends,' it ran, 'for the slight change of programme. Norbury is anxious that I should get my experiments over before the Director returns, so as to save discussion. He has asked me to begin to-night and says he will see Mr. and Miss Bellingham here, at the Museum. Please bring them along at once. I think some matters of importance may transpire at the interview.—J. E. T.'

'I hope you don't mind,' I said apologetically, when I had read the note to Ruth.

'Of course I don't,' she replied. 'I am rather pleased. We have so many associations with the dear old Museum, haven't we?' She looked at me for a moment with a strange and touching wistfulness and then turned to descend the stone stairs.

At the Temple gate I hailed a hansom, and we were soon speeding westward and north to the soft twinkle of the horse's bell.

'What are these experiments that Doctor Thorndyke refers to?' she asked presently.

'I can only answer you vaguely,' I replied. 'Their object, I believe, is to ascertain whether the penetrability of organic substances by the X-rays becomes altered by age; whether, for instance, an ancient block of wood is more or less transparent to the rays than a new block of the same size.'

'And of what use would the knowledge be, if it were obtained?'

'I can't say. Experiments are made to obtain knowledge without regard to its utility. The use appears when the
knowledge has been acquired. But in this case, if it should be possible to determine the age of any organic substance by its reaction to X-rays, the discovery might be found of some value in legal practice—as in demonstrating a new seal on an old document, for instance. But I don’t know whether Thorndyke has anything definite in view; I only know that the preparations have been on a most portentous scale.’

‘How do you mean?’

‘In regard to size. When I went into the workshop yesterday morning, I found Polton erecting a kind of portable gallows about nine feet high, and he had just finished varnishing a pair of enormous wooden trays each over six feet long. It looked as if he and Thorndyke were contemplating a few private executions with subsequent post-mortems on the victims.’

‘What a horrible suggestion!’

‘So Polton said, with his quaint, crinkly smile. But he was mighty close about the use of the apparatus all the same. I wonder if we shall see anything of the experiments, when we get there. This is Museum Street, isn’t it?’

‘Yes.’ As she spoke, she lifted the flap of one of the little windows in the back of the cab and peered out. Then, closing it with a quiet, ironic smile, she said:

‘It is all right; he hasn’t missed us. It will be quite a nice little change for him.’

The cab swung round into Great Russell Street, and, glancing out as it turned, I saw another hansom following; but before I had time to inspect its solitary passenger, we drew up at the Museum gates.

The gate porter, who seemed to expect us, ushered us up the drive to the great portico and into the Central Hall, where he handed us over to another official.

‘Doctor Norbury is in one of the rooms adjoining the Fourth Egyptian Room,’ the latter stated in answer to our inquiries: and, providing himself with a wire-guarded lantern, he prepared to escort us thither.

Up the great staircase, now wrapped in mysterious gloom, we passed in silence with bitter-sweet memories of that day of days when we had first trodden its steps together; through the Central Saloon, the Mediaeval Room and the Asiatic Saloon, and so into the long range of the Ethnographical Galleries.

It was a weird journey. The swaying lantern shot its beams abroad into the darkness of the great, dim galleries, casting instantaneous flashes on the objects in the cases, so that they leaped into being and vanished in the twinkling of an eye. Hideous idols with round, staring eyes started forth from the darkness, glared at us for an instant and were gone. Grotesque masks, suddenly revealed by the shimmering light, took on the semblance of demon faces that seemed to mow and gibber at us as we passed. As for the life-sized models—realistic enough by daylight—their aspect was positively alarming; for the moving light and shadow endowed them with life and movement, so that they seemed to watch us furtively, to lie in wait and to hold themselves in readiness to steal out and follow us.

The illusion evidently affected Ruth as well as me, for she drew nearer to me and whispered:

‘These figures are quite startling. Did you see that Polynesian? I really felt as if he were going to spring out on us.’

‘They are rather uncanny,’ I admitted, ‘but the danger is over now. We are passing out of their sphere of influence.’

We came out on a landing as I spoke and then turned sharply to the left along the North Gallery, from the centre of which we entered the Fourth Egyptian Room.

Almost immediately, a door in the opposite wall opened; a peculiar, high-pitched humming sound became audible, and Jervis came out on tip toe with his hand raised.

‘Tread as lightly as you can,’ he said. ‘We are just making an exposure.’

The attendant turned back with his lantern, and we followed Jervis into the room from whence he had come. It was a large room, and little lighter than the galleries, for the single glow-lamp that burned at the end where we entered left the rest of the apartment in almost complete obscurity. We seated ourselves at once on the chairs that had been placed for us, and, when the mutual salutations had been exchanged, I looked about me. There were three people in the room besides Jervis: Thorndyke, who sat with his watch in his hand, a grey-headed gentleman whom I took to be Dr. Norbury, and a smaller person at the dim farther end—undistinguishable, but probably Polton. At our end of the room were the two large trays that I had seen in the workshop, now mounted on trestles and each fitted with a rubber drain-tube leading down to a bucket. At the farther end of the room the sinister shape of the gallows reared itself aloof in the gloom; only now I could see that it was not a gallows at all. For affixed to the top cross-bar was a large, bottomless glass basin, inside which was a glass bulb that glowed with a strange green light; and in the heart of the bulb a bright spot of red.

It was all clear enough so far. The peculiar sound that filled the air was the hum of the interrupter; the bulb was, of course, a Crookes’ tube, and the red spot inside it, the glowing red-hot disc of the anti-cathode. Clearly an X-ray photograph was being made; but of what? I strained my eyes, peering into the gloom at the foot of the gallows, but though I could make out an elongated object lying on the floor directly under the bulb, I could not resolve the dimly seen shape into anything recognisable. Presently, however, Dr. Norbury supplied the clue.

‘I am rather surprised,’ said he, ‘that you chose so composite an object as a mummy to begin on. I should have thought that a simpler object, such as a coffin or a wooden figure, would have been more instructive.’
‘In some ways it would,’ replied Thorndyke, ‘but the variety of materials that the mummy gives us has its advantages. I hope your father is not ill, Miss Bellingham.’

‘He is not at all well,’ said Ruth, ‘and we agreed that it was better for me to come alone. I knew Herr Lederbogen quite well. He stayed with us for a time when he was in England.’

‘I trust,’ said Dr. Norbury, ‘that I have not troubled you for nothing. Herr Lederbogen speaks of “our erratic English friend with the long name that I can never remember,” and it seemed to me that he might be referring to your uncle.’

‘I should have hardly have called my uncle erratic,’ said Ruth.

‘No, no. Certainly not,’ Dr. Norbury agreed hastily. ‘However, you shall see the letter presently and judge for yourself. We mustn’t introduce irrelevant topics while the experiment is in progress, must we, Doctor?’

‘You had better wait until we have finished,’ said Thorndyke, ‘because I am going to turn out the light. Switch off the current, Polton.’

The green light vanished from the bulb, the hum of the interrupter swept down an octave or two and died away. Then Thorndyke and Dr. Norbury rose from their chairs and went towards the mummy, which they lifted tenderly while Polton drew from beneath it what presently turned out to be a huge black paper envelope. The single glow-lamp was switched off, leaving the room in total darkness until there burst suddenly a bright orange red light immediately above one of the trays.

We all gathered round to watch, as Polton—the high priest of these mysteries—drew from the black envelope a colossal sheet of bromide paper, laid it carefully in the tray and proceeded to wet it with a large brush which he had dipped in a pail of water.

‘I thought you always used plates for this kind of work,’ said Dr. Norbury.

‘We do, by preference; but a six-foot plate would be impossible, so I had a special paper made to the size.’

There is something singularly fascinating in the appearance of a developing photograph; in the gradual, mysterious emergence of the picture from the blank, white surface of plate or paper. But a siagraph, or X-ray photograph, has a fascination all its own. Unlike the ordinary photograph, which yields a picture of things already seen, it gives a presentment of objects hitherto invisible; and hence, when Polton poured the developer on the already wet paper, we all craned over the tray with the keenest curiosity.

The developer was evidently a very slow one. For fully half a minute no change could be seen in the uniform surface. Then, gradually, almost insensibly, the marginal portion began to darken, leaving the outline of the mummy in pale relief. The change, once started, proceeded apace. Darker and darker grew the margin of the paper until from slate grey it had turned to black; and still the shape of the mummy, now in strong relief, remained an elongated patch of bald white. But not for long. Presently the white shape began to be tinged with grey, and, as the colour deepened, there grew out of it a paler form that seemed to steal out of the enshrouding grey like an apparition, spectral, awesome, mysterious. The skeleton was coming into view.

‘It is rather uncanny,’ said Dr. Norbury. ‘I feel as if I were assisting at some unholy rite. Just look at it now!’

The grey shadow of the cartonnage, the wrappings and the flesh was fading away into the background and the white skeleton stood out in sharp contrast. And it certainly was rather a weird spectacle.

‘You’ll lose the bones if you develop much farther,’ said Dr. Norbury.

‘I must let the bones darken,’ Thorndyke replied, ‘in case there are any metallic objects. I have three more papers in the envelope.’

The white shape of the skeleton now began to grey over and, as Dr. Norbury had said, its distinctness became less and yet less. Thorndyke leaned over the tray with his eyes fixed on a point in the middle of the breast and we all watched him in silence. Suddenly he rose. ‘Now, Polton,’ he said sharply, ‘get the hypo on as quickly as you can.’

Polton, who had been waiting with his hand on the stop-cock of the drain-tube, rapidly ran off the developer into the bucket and flooded the paper with the fixing solution.

‘Now we can look at it at our leisure,’ said Thorndyke. After waiting a few seconds, he switched on one of the glow-lamps, and as the flood of light fell on the photograph, he added: ‘You see we haven’t quite lost the skeleton.’

‘No.’ Dr. Norbury put on a pair of spectacles and bent down over the tray; and at this moment I felt Ruth’s hand touch my arm, lightly, at first, and then with a strong nervous grasp; and I could feel that her hand was trembling. I looked round at her anxiously and saw that she had turned deathly pale.

‘Would you rather go out into the gallery?’ I asked; for the room with its tightly shut windows was close and hot.

‘No,’ she replied quietly, ‘I will stay here. I am quite well.’ But still she kept hold of my arm.

Thorndyke glanced at her keenly and then looked away as Dr. Norbury turned to ask him a question.

‘Why is it, think you, that some of the teeth show so much whiter than others?’

I think the whiteness of the shadows is due to the presence of metal,’ Thorndyke replied.
'Do you mean that the teeth have metal fillings?' asked Dr. Norbury.

'Yes.'

'Really! This is very interesting. The use of gold stopplings—and artificial teeth, too—by the ancient Egyptians is well known, but we have no examples in this Museum. This mummy ought to be unrolled. Do you think all those teeth are filled with the same metal? They are not equally white.'

'No,' replied Thorndyke. 'Those teeth that are perfectly white are undoubtedly filled with gold, but that greyish one is probably filled with tin.'

'Very interesting,' said Dr. Norbury. 'Very interesting! And what do you make of that faint mark across the chest, near the top of the sternum?'

It was Ruth who answered his question. 'It is the eye of Osiris!' she exclaimed in a hushed voice.

'Dear me!' exclaimed Dr. Norbury, 'so it is. You are quite right. It is the Utchat—the Eye of Horus—or Osiris, if you prefer to call it so. That, I presume, will be a gilded device on some of the wrappings.'

'No; I should say it is a tattoo mark. It is too indefinite for a gilded device. And I should say further that the tattooing is done in vermillion, as carbon tattooing would cast no visible shadow.'

'I think you must be mistaken about that,' said Dr. Norbury, 'but we shall see, if the Director allows us to unroll the mummy. By the way, those little objects in front of the knees are metallic, I suppose?'

'Yes, they are metallic. But they are not in front of the knees—they are in the knees. They are pieces of silver wire which have been I used to repair fractured kneecaps.'

'Are you sure of that?' exclaimed Dr. Norbury, peering at the little white marks with ecstasy; 'because if you are, and if these objects are what you say they are, the mummy of Sebekhotep is an absolutely unique specimen.'

'I am quite certain of it,' said Thorndyke.

'Then,' said Dr. Norbury, 'we have made a discovery, thanks to your inquiring spirit. Poor John Bellingham! He little knew what a treasure he was giving us! How I wish he could have known! How I wish he could have been here with us tonight!'

He paused once more to gaze in rapture at the photograph. And then Thorndyke, in his quiet, impassive way, said:

'John Bellingham is here, Doctor Norbury. This is John Bellingham.'

Dr Norbury started back and stared at Thorndyke in speechless amazement.

'You don't mean,' he exclaimed, after a long pause, 'that this mummy is the body of John Bellingham?'

'I do indeed. There is no doubt of it.'

'But it is impossible! The mummy was here in the gallery a full three weeks before he disappeared.'

'Not so,' said Thorndyke. 'John Bellingham was last seen alive by you and Mr. Jellicoe on the fourteenth of October, more than three weeks before the mummy left Queen Square. After that date he was never seen alive or dead by any person who knew him and could identify him.'

Dr Norbury reflected awhile in silence. Then, in a faint voice, he asked:

'How do you suggest that John Bellingham's body came to be inside that cartonnage?'

'I think Mr. Jellicoe is the most likely person to be able to answer that question,' Thorndyke replied dryly.

There was another interval of silence, and then Dr. Norbury asked suddenly:

'But what do you suppose has become of Sebekhotep? The real Sebekhotep, I mean?'

'I take it,' said Thorndyke, 'that the remains of Sebekhotep, or at least a portion of them, are at present lying in the Woodford mortuary awaiting an adjourned inquest.'

As Thorndyke made this statement a flash of belated intelligence, mingled with self-contempt, fell on me. Now that the explanation was given, how obvious it was! And yet I, a competent anatomist and physiologist and actually a pupil of Thorndyke's, had mistaken those ancient bones for the remains of a recent body!

Dr Norbury considered the last statement for some time in evident perplexity. 'It is all consistent enough, I must admit,' said he, at length, 'and yet—are you quite sure there is no mistake? It seems so incredible.'

There is no mistake, I assure you,' Thorndyke answered. 'To convince you, I will give you the facts in detail. First, as to the teeth. I have seen John Bellingham's dentist and obtained particulars from his case-book. There were in all five teeth that had been filled. The right upper wisdom-tooth, the molar next to it, and the second lower molar on the left side, had all extensive gold fillings. You can see them all quite plainly in the skiagraph. The left lower lateral incisor had a very small gold filling, which you can see as a nearly circular white dot. In addition to these, a filling of tin amalgam had been inserted while the deceased was abroad, in the second left upper bicuspid, the rather grey spot that we have already noticed. These would, by themselves, furnish ample means of identification. But in addition, there is the tattooed device of the eye of
Osiris—'

'Horus,' murmured Dr. Norbury.

'Horus, then—in the exact locality in which it was borne by the deceased and tattooed, apparently, with the same pigment. There are, further, the suture wires in the knee-caps; Sir Morgan Bennet, having looked up the notes of the operation, informs me that he introduced three suture wires into the left patella and two into the right; which is what the skiagraph shows. Lastly, the deceased had an old Pott's fracture on the left side. It is not very apparent now, but I saw it quite distinctly just now when the shadows of the bones were whiter. I think that you may take it that the identification is beyond all doubt or question.'

'Yes,' agreed Dr. Norbury, with gloomy resignation, 'it sounds, as you say, quite conclusive. Well, well, it is a most horrible affair. Poor old John Bellingham! It looks uncommonly as if he had met with foul play. Don't you think so?'

'I do,' replied Thorndyke. 'There was a mark on the right side of the skull that looked rather like a fracture. It was not very clear, being at the side, but we must develop the negative to show it.'

Dr. Norbury drew his breath in sharply through his teeth. 'This is a gruesome business, Doctor,' said he. 'A terrible business. Awkward for our people, too. By the way, what is our position in the matter? What steps ought we to take?'

'You should give notice to the coroner—I will manage the police—and you should communicate with one of the executors of the will.'

'Mr. Jellicoe?'

'No, not Mr. Jellicoe, under the peculiar circumstances. You had better write to Mr. Godfrey Bellingham.'

'But I rather understood that Mr. Hurst was the co-executor,' said Dr. Norbury.

'He is, surely, as matters stand,' said Jervis.

'Not at all,' replied Thorndyke. 'He was as matters stood; but he is not now. You are forgetting the conditions of clause two. That clause sets forth the conditions under which Godfrey Bellingham shall inherit the bulk of the estate and become the co-executor; and those conditions are: that the body of the testator shall be deposited in some authorised place for the reception of the bodies of the dead, situate within the boundaries of, or appertaining to some place of worship within, the parish of St. George, Bloomsbury, and St. Giles in the Fields, or St. Andrews above the Bars and St. George the Martyr. Now Egyptian mummies are bodies of the dead, and this Museum is an authorised place for their reception; and this building is situate within the boundaries of the parish of St. George, Bloomsbury. Therefore the provisions of clause two have been duly carried out and therefore Godfrey Bellingham is the principal beneficiary under the will, and the co-executor; in accordance with the wishes of the testator. Is that quite clear?'

'Perfectly,' said Dr. Norbury; 'and a most astonishing coincidence—but, my dear young lady, had you not better sit down? You are looking very ill.'

He glanced anxiously at Ruth, who was pale to the lips and was now leaning heavily on my arm.

'I think, Berkeley,' said Thorndyke, 'you had better take Miss Bellingham out into the gallery, where there is more air. This has been a tremendous climax to all the trials she has borne so bravely. Go out with Berkeley,' he added gently, laying his hand on her shoulder, 'and sit down while we develop the other negatives. You mustn't break down now, you know, when the storm has passed and the sun is beginning to shine.' He held the door open and as we passed out his face softened into a smile of infinite kindness. 'You won't mind my locking you out,' said he; 'this is a photographic dark-room at present.'

The key grated in the lock and we turned away into the dim gallery. It was not quite dark, for a beam of moonlight filtered in here and there through the blinds that covered the sky-lights. We walked on slowly, her arm linked in mine, and for a while neither of us spoke. The great rooms were very silent and peaceful and solemn. The hush, the stillness, the mystery of the half-seen forms in the cases around, were all in harmony with the deeply-felt sense of a great deliverance that filled our hearts.

We had passed through into the next room before either of us broke the silence. Insensibly our hands had crept together, and as they met and clasped with mutual pressure, Ruth exclaimed: 'How dreadful and tragic it is! Poor, poor Uncle John! It seems as if he had come back from the world of shadows to tell us of this awful thing. But, O God! what a relief it is!'

She caught her breath in one or two quick sobs and pressed my hand passionately.

'It is over, dearest,' I said. 'It is gone for ever. Nothing remains but the memory of your sorrow and your noble courage and patience.'

'I can't realise it yet,' she murmured. 'It has been like a frightful, interminable dream.'

'Let us put it away,' said I, 'and think only of the happy life that is opening.'

She made no reply, and only a quick catch in her breath, now and again, told of the long agony that she had endured with such heroic calm.

We walked on slowly, scarcely disturbing the silence with our soft footfalls, through the wide doorway into the second room. The vague shapes of mummy-cases standing erect in the wall-cases, loomed out dim and gigantic, silent watchers
keeping their vigil with the memories of untold centuries locked in their shadowy breasts. They were an awesome company. Reverend survivors from a vanished world, they looked out from the gloom of their abiding-place, but with no shade of menace or of malice in their silent presence; rather with a solemn benison on the fleeting creatures of to-day.

Half-way along the room a ghostly figure, somewhat aloof from its companions, showed a dim, pallid blotch where its face would have been. With one accord we halted before it.

‘Do you know who this is, Ruth?’ I asked.

‘Of course I do,’ she answered. ‘It is Artemidorus.’

We stood, hand in hand, facing the mummy, letting our memories fill in the vague silhouette with its well-remembered details. Presently I drew her nearer to me and whispered:

‘Ruth! do you remember when we last stood here?’

‘As if I could ever forget!’ she answered passionately. ‘Oh, Paul! The sorrow of it! The misery! How it wrung my heart to tell you! Were you very unhappy when I left you?’

‘Unhappy! I never knew, until then, what real, heart-breaking sorrow was. It seemed as if the light had gone out of my life for ever. But there was just one little spot of brightness left.’

‘What was that?’

‘You made me a promise, dear—a solemn promise; and I felt—at least I hoped—that the day would come, if I only waited patiently, when you would be able to redeem it.’

She crept closer to me and yet closer, until her head nestled on my shoulder and her soft cheek lay against mine.

‘Dear heart,’ I whispered, ‘is it now? Is the time fulfilled?’

‘Yes, dearest,’ she murmured softly. ‘It is now—and for ever.’

Reverently I folded her in my arms; gathered her to the heart that worshipped her utterly. Henceforth no sorrows could hurt us, no misfortunes vex; for we should walk hand in hand on our earthly pilgrimage and find the way all too short.

Time, whose sands run out with such unequal swiftness for the just and the unjust, the happy and the wretched, lagged, no doubt, with the toilers in the room that we had left. But for us its golden grains trickled out apace, and left the glass empty before we had begun to mark their passage. The turning of a key and the opening of a door aroused us from our dream of perfect happiness. Ruth raised her head to listen, and our lips met for one brief moment. Then, with a silent greeting to the friend who had looked on our grief and witnessed our final happiness, we turned and retraced our steps quickly, filling the great empty rooms with chattering echoes.

‘We won’t go back into the dark-room—which isn’t dark now,’ said Ruth.

‘Why not?’ I asked.

‘Because—when I came out I was very pale; and I’m—well, I don’t think I am very pale now. Besides, poor Uncle John is in there—and—I should be ashamed to look at him with my selfish heart overflowing with happiness.’

‘You needn’t be,’ said I. ‘It is the day of our lives and we have a right to be happy. But youshan’t go in, if you don’t wish to,’ and I accordingly steered her adroitly past the beam of light that streamed from the open door.

‘We have developed four negatives,’ said Thorndyke, as he emerged with the others, ‘and I am leaving them in the custody of Doctor Norbury, who will sign each when they are dry, as they may have to be put in evidence. What are you going to do?’

I looked at Ruth to see what she wished.

‘If you won’t think me ungrateful,’ said she, ‘I should rather be alone with my father to-night. He is very weak, and—’

‘Yes, I understand,’ I said hastily. And I did. Mr. Bellingham was a man of strong emotions and would probably be somewhat overcome by the sudden change of fortune and the news of his brother’s tragic death.

‘In that case,’ said Thorndyke, ‘I will bespeak your services. Will you go on and wait for me at my chambers, when you have seen Miss Bellingham home?’

I agreed to this, and we set forth under the guidance of Dr. Norbury (who carried an electric lamp) to return by the way we had come; two of us, at least, in a vastly different frame of mind. The party broke up at the entrance gates, and as Thorndyke wished my companion ‘Good-night,’ she held his hand and looked up in his face with swimming eyes.

‘I haven’t thanked you, Doctor Thorndyke,’ she said, ‘and I don’t feel that I ever can. What you have done for me and my father is beyond all thanks. You have saved his life and you have rescued me from the most horrible ignominy. Good-bye! and God bless you!’

The hansom that bowled along eastward—at most unnecessary speed—bore two of the happiest human beings within the wide boundaries of the town. I looked at my companion as the lights of the street shone into the cab, and was astonished at the transformation. The pallor of her cheek had given place to a rosy pink; the hardness, the tension, the haggard self-repression that had aged her face, were all gone, and the girlish sweetness that had so bewitched me in the early days of
our love had stolen back. Even the dimple was there when the sweeping lashes lifted and her eyes met mine in a smile of infinite tenderness.

Little was said on that brief journey. It was happiness enough to sit, hand clasped in hand, and know that our time of trial was past; that no cross of Fate could ever part us now.

The astonished cabman set us down, according to instructions, at the entrance to Nevill's Court, and watched us with open mouth as we vanished into the narrow passage. The court had settled down for the night, and no one marked our return; no curious eye looked down on us from the dark house-front as we said 'Good-bye' just inside the gate.

'You will come and see us to-morrow, dear, won't you?' she asked.

'Do you think it possible that I could stay away, then?'

'I hope not, but come as early as you can. My father will be positively frantic to see you; because I shall have told him, you know. And, remember, that it is you who have brought us this great deliverance. Good-night, Paul.'

'Good-night, sweetheart.'

She put up her face frankly to be kissed and then ran up to the ancient door; whence she waved me a last good-bye. The shabby gate in the wall closed behind me and hid her from my sight; but the light of her love went with me and turned the dull street into a path of glory.

XIX. — A STRANGE SYMPOSIUM

IT came upon me with something of a shock of surprise to find the scrap of paper still tacked to the oak of Thorndyke's chambers. So much had happened since I had last looked on it that it seemed to belong to another epoch of my life. I removed it thoughtfully and picked out the tack before entering, and then, closing the inner door, but leaving the oak open, I lit the gas and fell to pacing the room.

What a wonderful episode it had been! How the whole aspect of the world had been changed in a moment by Thorndyke's revelation! At another time, curiosity would have led me to endeavour to trace back the train of reasoning by which the subtle brain of my teacher had attained this astonishing conclusion. But now my own happiness held exclusive possession of my thoughts. The image of Ruth filled the field of my mental vision. I saw her again as I had seen her in the cab with her sweet, pensive face and downcast eyes; I felt again the touch of her soft cheek and the parting kiss by the gate, so frank and simple, so intimate and final.

I must have waited quite a long time, though the golden minutes sped unreckoned, for when my two colleagues arrived they tendered needless apologies.

'And I suppose,' said Thorndyke, 'you have been wondering what I wanted you for.'

I had not, as a matter of fact, given the matter a moment's consideration.

'We are going to call on Mr. Jellicoe,' Thorndyke explained. 'There is something behind this affair, and until I have ascertained what it is, the case is not complete from my point of view.'

'Wouldn't it have done as well to-morrow?' I asked.

'It might; and then it might not. There is an old saying as to catching a weasel asleep. Mr. Jellicoe is a somewhat wide-awake person, and I think it best to introduce him to Inspector Badger at the earliest possible moment.'

'The meeting of a weasel and a badger suggests a sporting interview,' remarked Jervis. 'But you don't expect Jellicoe to give himself away, do you?'

'He can hardly do that, seeing that there is nothing to give away. But I think he may make a statement. There were some exceptional circumstances, I feel sure.'

'How long have you known that the body was in the Museum?' I asked.

'About thirty or forty seconds longer than you have, I should say.'

'Do you mean,' I exclaimed, 'that you did not know until the negative was developed?'

'My dear fellow,' he replied, 'do you suppose that, if I had had certain knowledge where the body was, I should have allowed that noble girl to go on dragging out a lingering agony of suspense that I could have cut short in a moment? Or that I should have made these humbugging pretences of scientific experiments if a more dignified course had been open to me?'

'As to the experiments,' said Jervis, 'Norbury could hardly have refused if you had taken him into your confidence.'

'Indeed he could, and probably would. My “confidence” would have involved a charge of murder against a highly respectable gentleman who was well known to him. He would probably have referred me to the police, and then what could I have done? I had plenty of suspicions, but not a single solid fact.'

Our discussion was here interrupted by hurried footsteps on the stairs and a thundering rat-tat on our knocker.

As Jervis opened the door, Inspector Badger burst into the room in a highly excited state.
'What is all this, Doctor Thorndyke?' he asked. 'I see you've sworn an information against Mr. Jellicoe, and I have a warrant to arrest him; but before anything else is done I think it right to tell you that we have more evidence than is generally known pointing to quite a different quarter.'

'Derived from Mr. Jellicoe's information,' said Thorndyke. 'But the fact is that I have just examined and identified the body at the British Museum, where it was deposited by Mr. Jellicoe. I don't say that he murdered John Bellingham—though that is what appearances suggest—but I do say that he will have to account for his secret disposal of the body.'

Inspector Badger was thunderstruck. Also he was visibly annoyed. The salt which Mr. Jellicoe had so adroitly sprinkled on the constabulary tail appeared to develop irritating properties, for when Thorndyke had given him a brief outline of the facts he stuck his hands in his pockets and exclaimed gloomily:

'Well, I'm hanged! And to think of all the time and trouble I've spent on those damned bones! I suppose they were just a plant?'

'Don't let us disparage them,' said Thorndyke. 'They have played a useful part. They represent the inevitable mistake that every criminal makes sooner or later. The murderer will always do a little too much. If he would only lie low and let well alone, the detective might whistle for a clue. But it is time we were starting.'

'Are we all going?' asked the inspector, looking at me in particular with no very gracious recognition.

'Well, I will agree to surrender myself subject to certain conditions.'

'I can't make any conditions, Mr. Jellicoe.'

'No, I will make them, and you will accept them. Otherwise you will not arrest me.'

'It's no use for you to talk like that,' said Badger. 'If you don't let me in I shall have to break in. And I may as well tell you,' he added mendaciously, 'that the house is surrounded.'

'You may accept my assurance,' Mr. Jellicoe replied calmly, 'that you will not arrest me if you do not accept my conditions.'

'Well, what are your conditions?' demanded Badger.

'I desire to make a statement,' said Mr. Jellicoe.

'You can do that, but I must caution you that anything you say may be used in evidence against you.'

'Naturally. But I wish to make the statement in the presence of Doctor Thorndyke, and I desire to hear a statement from him of the method of investigation by which he discovered the whereabouts of the body. That is to say, if he is willing.'

'If you mean that we should mutually enlighten one another, I am very willing indeed,' said Thorndyke.

'Very well. Then my conditions, Inspector, are that I shall hear Doctor Thorndyke's statement and that I shall be permitted to make a statement myself, and that until those statements are completed, with any necessary interrogation and discussion, I shall remain at liberty and shall suffer no molestation or interference of any kind. And I agree that, on the conclusion of the said proceedings, I will submit without resistance to any course that you may adopt.'
‘I can’t agree to that,’ said Badger.
‘Can’t you?’ said Mr. Jellicoe coldly; and after a pause he added: ‘Don’t be hasty. I have given you warning.’

There was something in Mr. Jellicoe’s passionless tone that disturbed the inspector exceedingly, for he turned to Thorndyke and said in a low tone:

‘I wonder what his game is? He can’t get away, you know.’

‘There are several possibilities,’ said Thorndyke.

‘M’m, yes,’ said Badger, stroking his chin perplexedly.

‘After all, is there any objection? His statement might save trouble, and you’d be on the safe side. It would take you some time to break in.’

‘Well,’ said Mr. Jellicoe, with his hand on the window, ‘do you agree—yes or no?’

‘All right,’ said Badger sulkily. ‘I agree.’

‘You promise not to molest me in any way until I have quite finished?’

‘I promise.’

Mr. Jellicoe’s head disappeared and the window closed. After a short pause we heard the jar of massive bolts and the clank of a chain, and, as the heavy door swung open, Mr. Jellicoe stood revealed, calm and impassive, with an old-fashioned office candlestick in his hand.

Who are the others?’ he inquired, peering out sharply through his spectacles.

‘Oh, they are nothing to do with me,’ replied Badger.

They are Doctor Berkeley and Doctor Jervis,’ said Thorndyke.

‘Ha!’ said Mr. Jellicoe; ‘very kind and attentive of them to call. Pray, come in, gentlemen. I am sure you will be interested to hear our little discussion.’

He held the door open with a certain stiff courtesy, and we all entered the hall led by Inspector Badger. He closed the door softly and preceded us up the stairs and into the apartment from the window of which he had dictated the terms of surrender. It was a fine old room, spacious, lofty, and dignified, with panelled walls and a carved mantelpiece, the central escutcheon of which bore the initials ‘J. W. P.’ with the date ‘1671.’ A large writing-table stood at the farther end, and behind it an iron safe.

‘I have been expecting this visit,’ Mr. Jellicoe remarked tranquilly as he placed four chairs opposite the table. ‘Since when?’ asked Thorndyke.

‘Since last Monday evening, when I had the pleasure of seeing you conversing with my friend Doctor Berkeley at the Inner Temple gate, and then inferred that you were retained in the case. That was a circumstance that had not been fully provided for. May I offer you gentlemen a glass of sherry?’

As he spoke he placed on the table a decanter and a tray of glasses, and looked at us interrogatively with his hand on the stopper.

‘Well, I don’t mind if I do, Mr. Jellicoe,’ said Badger, on whom the lawyer’s glance had finally settled. Mr. Jellicoe filled a glass and handed it to him with a stiff bow; then, with the decanter still in his hand, he said persuasively: ‘Doctor Thorndyke, pray allow me to fill you a glass?’

‘No, thank you,’ said Thorndyke, in a tone so decided that the inspector looked round at him quickly. And as Badger caught his eye, the glass which he was about to raise to his lips became suddenly arrested and was slowly returned to the table untasted.

‘I don’t want to hurry you, Mr. Jellicoe,’ said the inspector, ‘but it’s rather late, and I should like to get this business settled. What is it that you wish to do?’

‘I desire,’ replied Mr. Jellicoe, ‘to make a detailed statement of the events that have happened, and I wish to hear from Doctor Thorndyke precisely how he arrived at his very remarkable conclusion. When this has been done I shall be entirely at your service; and I suggest that it would be more interesting if Doctor Thorndyke would give us his statement before I furnish you with the actual facts.’

‘I am entirely of your opinion,’ said Thorndyke.—I

‘Then in that case,’ said Mr. Jellicoe, ‘I suggest that you disregard me, and address your remarks to your friends as if I were not present.’

Thorndyke acquiesced with a bow, and Mr. Jellicoe, having seated himself in his elbow-chair behind the table, poured himself out a glass of water, selected a cigarette from a neat silver case, lighted it deliberately, and leaned back to listen at his ease.

‘My first acquaintance with this case,’ Thorndyke began without preamble, ‘was made through the medium of the daily papers about two years ago; and I may say that, although I had no interest in it beyond the purely academic interest of a
specialist in a case that lies in his particular speciality, I considered it with deep attention. The newspaper reports contained no particulars of the relations of the parties that could furnish any hints as to motives on the part of any of them, but merely a bare statement of the events. And this was a distinct advantage, inasmuch as it left one to consider the facts of the case without regard to motive—to balance the prima facie probabilities with an open mind. And it may surprise you to learn that those prima facie probabilities pointed from the very first to that solution which has been put to the test of experiment this evening. Hence it will be well for me to begin by giving the conclusions that I reached by reasoning from the facts set forth in the newspapers before any of the further facts came to my knowledge.

'From the facts as stated in the newspaper reports it is obvious that there were four possible explanations of the disappearance.

'1. The man might be alive and in hiding. This was highly improbable, for the reasons that were stated by Mr. Loram at the late hearing of the application, and for a further reason that I shall mention presently.

'2. He might have died by accident or disease, and his body failed to be identified. This was even more improbable, seeing that he carried on his person abundant means of identification, including visiting cards.

'3. He might have been murdered by some stranger for the sake of his portable property. This was highly improbable for the same reason: his body could hardly have failed to be identified.

'These three explanations are what we may call the outside explanations. They touched none of the parties mentioned; they were all obviously improbable on general grounds; and to all of them there was one conclusive answer—the scarab which was found in Godfrey Bellingham's garden. Hence I put them aside and gave my attention to the fourth explanation. This was that the missing man had been made away with by one of the parties mentioned in the report. But, since the reports mentioned three parties, it was evident that there was a choice of three hypotheses namely:

'(a) That John Bellingham had been made away with by Hurst; or (b) by the Bellinghams; or (c) by Mr. Jellicoe.

'Now, I have constantly impressed on my pupils that the indispensable question that must be asked at the outset of such an inquiry as this is, "When was the missing person last undoubtedly seen or known to be alive?" That is the question that I asked myself after reading the newspaper report; and the answer was, that he was last certainly seen alive on the fourteenth of October, nineteen hundred and two, at 141, Queen Square, Bloomsbury. Of the fact that he was alive at that time and place there could be no doubt whatever; for he was seen at the same moment by two persons, both of whom were intimately acquainted with him, and one of whom, Doctor Norbury, was apparently a disinterested witness. After that date he was never seen, alive or dead, by any person who knew him and was able to identify him. It was stated that he had been seen on the twenty-third of November following by the housemaid of Mr. Hurst; but as this person was unacquainted with him, it was uncertain whether the person whom she saw was or was not John Bellingham.

'Hence the disappearance dated, not from the twenty-third of November, as every one seems to have assumed, but from the fourteenth of October; and the question was not, "What became of John Bellingham after he entered Mr. Hurst's house?" but, "What became of him after his interview in Queen Square?"

'But as soon as I had decided that that interview must form the real starting point of the inquiry, a most striking set of circumstances came into view. It became obvious that if Mr. Jellicoe had had any reason for wishing to make away with John Bellingham, he had such an opportunity as seldom falls to the lot of an intending murderer.

'Just consider the conditions. John Bellingham was known to be setting out alone upon a journey beyond the sea. His exact destination was not stated. He was to be absent for an undetermined period, but at least three weeks. His disappearance would occasion no comment; his absence would lead to no inquiries, at least for several weeks, during which the murderer would have leisure quietly to dispose of the body and conceal all traces of the crime. The conditions were, from a murderer's point of view, ideal.

'But that was not all. During that very period of John Bellingham's absence Mr. Jellicoe was engaged to deliver to the British Museum what was admittedly a dead human body; and that body was to be enclosed in a sealed case. Could any more perfect or secure method of disposing of a body be devised by the most ingenious murderer? The plan would have had only one weak point: the mummy would be known to have left Queen Square after the disappearance of John Bellingham, and suspicion might in the end have arisen. To this point I shall return presently; meanwhile we will consider the second hypothesis—that the missing man was made away with by Mr. Hurst.

'Now, there seemed to be no doubt that some person, purporting to be John Bellingham, did actually visit Mr. Hurst's house; and he must either have left the house or remained in it. If he left, he did so surreptitiously; if he remained, there could be no reasonable doubt that he had been murdered and that his body had been concealed. Let us consider the probabilities in each case.

'Assuming—as every one seems to have done—that the visitor was really John Bellingham, we are dealing with a responsible, middle-aged gentleman, and the idea that such a person would enter a house, announce his intention of staying, and then steal away unobserved is very difficult to accept. Moreover, he would appear to have come down to Eltham by rail immediately on landing in England, leaving his luggage in the cloak-room at Charing Cross. This pointed to a definiteness of purpose quite inconsistent with his casual disappearance from the house.

'On the other hand, the idea that he might have been murdered by Hurst was not inconceivable. The thing was physically possible. If Bellingham had really been in the study when Hurst came home, the murder could have been committed—by
appropriate means—and the body temporarily concealed in the cupboard or elsewhere. But, although possible it was not at all probable. There was no real opportunity. The risk and the subsequent difficulties would be very great; there was not a particle of positive evidence that a murder had occurred; and the conduct of Hurst in immediately leaving the house in possession of the servants is quite inconsistent with the supposition that there was a body concealed in it. So that, while it is almost impossible to believe that John Bellingham left the house of his own accord, it is equally difficult to believe that he did not leave it.

'But there is a third possibility, which, strange to say, no one seems to have suggested. Supposing that the visitor was not John Bellingham at all, but some one who was personating him? That would dispose of the difficulties completely. The strange disappearance ceases to be strange, for a personator would necessarily make off before Mr. Hurst should arrive and discover the imposture. But if we accept this supposition, we raise two further questions: “Who was the personator?” and “What was the object of the personation?”

'Now, the personator was clearly not Hurst himself, for he would have been recognised by his housemaid; he was therefore either Godfrey Bellingham or Mr. Jellicoe or some other person; and as no other person was mentioned in the newspaper reports I confined my speculations to these two.

'And, first, as to Godfrey Bellingham. It did not appear whether he was or was not known to the housemaid, so I assumed—wrongly, as it turns out—that he was not. Then he might have been the personator. But why should he have personated his brother? He could not have already committed the murder. There had not been time enough. He would have had to leave Woodford before John Bellingham had set out from Charing Cross. And even if he had committed the murder, he would have no object in raising this commotion. His cue would have been to remain quiet and know nothing. The probabilities were all against the personator being Godfrey Bellingham.

'Then could it be Mr. Jellicoe? The answer to this question is contained in the answer to the further question: What could have been the object of the personation?

'What motive could this unknown person have had in appearing, announcing himself as John Bellingham, and forthwith vanishing? There could only have been one motive: that, namely, of fixing the date of John Bellingham's disappearance—of furnishing a definite moment at which he was last seen alive.

'But who was likely to have had such a motive? Let us see.

'I said just now that if Mr. Jellicoe had murdered John Bellingham and disposed of the body in the mummy-case, he would have been absolutely safe for the time being. But there would be a weak spot in his armour. For a month or more the disappearance of his client would occasion no remark. But presently, when he failed to return, inquiries would be set on foot; and then it would appear that no one had seen him since he left Queen Square. Then it would be noted that the last person with whom he was seen was Mr. Jellicoe. It might, further, be remembered that the mummy had been delivered to the Museum some time after the missing man was last seen alive. And so suspicion might arise and be followed by disastrous investigations. But supposing it should be made to appear that John Bellingham had been seen alive more than a month after his interview with Mr. Jellicoe and some weeks after the mummy had been deposited in the Museum? Then Mr. Jellicoe would cease to be in any way connected with the disappearance and henceforth would be absolutely safe.

'Hence, after carefully considering this part of the newspaper report, I came to the conclusion that the mysterious occurrence at Mr. Hurst's home had only one reasonable explanation, namely, that the visitor was not John Bellingham, but some one personating him; and that that some one was Mr. Jellicoe.

'It remains to consider the case of Godfrey Bellingham and his daughter, though I cannot understand how any sane person can have seriously suspected either' (here Inspector Badger smiled a sour smile). 'The evidence against them was negligible, for there was nothing to connect them with the affair save the finding of the scarab on their premises; and that event, which might have been highly suspicious under other circumstances, was robbed of any significance by the fact that the scarab was found on a spot which had been passed a few minutes previously by the other suspected party, Hurst. The finding of the scarab did, however, establish two important conclusions: namely, that John Bellingham had probably met with foul play, and that of the four persons present when it was found, one at least had had possession of the body. As to which of the four was the one, the circumstances furnished only a hint, which was this: If the scarab had been purposely dropped, the most likely person to find it was the one who dropped it. And the person who discovered it was Mr. Jellicoe.

'Following up this hint, if we ask ourselves what motive Mr. Jellicoe could have had for dropping it—assuming him to be the murderer—the answer is obvious. It would not be his policy to fix the crime on any particular person, but rather to set up a complication of conflicting evidence which would occupy the attention of investigators and divert it from himself.

'Of course, if Hurst had been the murderer, he would have had a sufficient motive for dropping the scarab, so that the case against Mr. Jellicoe was not conclusive; but the fact that it was he who found it was highly significant.

'This completes the analysis of the evidence contained in the original newspaper report describing the circumstances of the disappearance. The conclusions that followed from it were, as you will have seen:

'1. That the missing man was almost certainly dead, as proved by the finding of the scarab after his disappearance.

'2. That he had probably been murdered by one or more of four persons, as proved by the finding of the scarab on the premises occupied by two of them and accessible to the others.

'3. That, of those four persons, one—Mr. Jellicoe—was the last person who was known to have been in the company of
the missing man; had had an exceptional opportunity for committing the murder; and was known to have delivered a dead body to the Museum subsequently to the disappearance.

'That the supposition that Mr. Jellicoe had committed the murder rendered all the other circumstances of the disappearance clearly intelligible, whereas on any other supposition they were quite inexplicable.

'The evidence of the newspaper report, therefore, clearly pointed to the probability that John Bellingham had been murdered by Mr. Jellicoe and his body concealed in the mummy-case.

'I do not wish to give you the impression that I, then and there, believed that Mr. Jellicoe was the murderer. I did not. There was no reason to suppose that the report contained all the essential facts, and I merely considered it speculatively as a study in probabilities. But I did decide that that was the only probable conclusion from the facts that were given.

'Nearly two years had passed before I heard anything more of the case. Then it was brought to my notice by my friend, Doctor Berkeley, and I became acquainted with certain new facts, which I will consider in the order in which they became known to me.

'The first new light on the case came from the will. As soon as I had read the document I felt convinced that there was something wrong. The testator's evident intention was that his brother should inherit the property, whereas the construction of the will was such as almost certainly to defeat that intention. The devolution of the property depended on the burial clause—clause two; but the burial arrangements would ordinarily be decided by the executor, who happened to be Mr. Jellicoe. Thus the will left the disposition of the property under the control of Mr. Jellicoe, though his action could have been contested.

'Now, this will, although drawn up by John Bellingham, was executed in Mr. Jellicoe's office as is proved by the fact that it was witnessed by two of his clerks. He was the testator's lawyer, and it was his duty to insist on the will being properly drawn. Evidently he did nothing of the kind, and this fact strongly suggested some kind of collusion on his part with Hurst, who stood to benefit by the miscarriage of the will. And this was the odd feature in the case; for whereas the party responsible for the defective provisions was Mr. Jellicoe, the party who benefited was Hurst.

'But the most startling peculiarity of the will was the way in which it fitted the circumstances of the disappearance. It looked as if clause two had been drawn up with those very circumstances in view. Since, however, the will was ten years old, this was impossible. But if clause two could not have been devised to fit the disappearance, could the disappearance have been devised to fit clause two? That was by no means impossible: under the circumstances it looked rather probable. And if it had been so contrived, who was the agent in that contrivance? Hurst stood to benefit, but there was no evidence that he even knew the contents of the will. There only remained Mr. Jellicoe, who had certainly connived at the misdrawing of the will for some purpose of his own—some dishonest purpose.

'The evidence of the will, then, pointed to Mr. Jellicoe as the agent in the disappearance, and, after reading it, I definitely suspected him of the crime.

'Suspicion, however, is one thing and proof is another; I had not nearly enough evidence to justify me in laying an information, and I could not approach the Museum officials without making a definite accusation. The great difficulty of the case was that I could discover no motive. I could not see any way in which Mr. Jellicoe would benefit by the disappearance. His own legacy was secure, whenever and however the testator died. The murder and concealment apparently benefited Hurst alone; and, in the absence of any plausible motive, the facts required to be much more conclusive than they were.'

'Did you form absolutely no opinion as to motive?' asked Mr. Jellicoe.

'He put the question in a quiet, passionless tone, as if he were discussing some cause celebre in which he had nothing more than a professional interest. Indeed, the calm, impersonal interest that he displayed in Thorndyke's analysis, his unmoved attention, punctuated by little nods of approval at each telling point in the argument, were the most surprising features of this astounding interview.

'I did form an opinion,' replied Thorndyke, 'but it was merely speculative, and I was never able to confirm it. I discovered that about ten years ago Mr. Hurst had been in difficulties and that he had suddenly raised a considerable sum of money, no one knew how or on what security. I observed that this event coincided with the execution of the will, and I surmised that there might be some connection between them. But that was only a surmise; and, as the proverb has it, "He discovers who proves." I could prove nothing, so that I never discovered Mr. Jellicoe's motive, and I don't know it now.'

'Don't you really?' said Mr. Jellicoe, in something approaching a tone of animation. He laid down the end of his cigarette, and, as he selected another from the silver case, he continued: 'I think that is the most interesting feature of your really remarkable analysis. It does you great credit. The absence of motive would have appeared to most persons a fatal objection to the theory of, what I may call, the prosecution. Permit me to congratulate you on the consistency and tenacity with which you have pursued the actual, visible facts.'

'He bowed stiffly to Thorndyke (who returned his bow with equal stiffness), lighted a fresh cigarette, and once more leaned back in his chair with the calm, attentive manner of a man who is listening to a lecture or a musical performance.

'The evidence, then, being insufficient to act upon,' Thorndyke resumed, 'there was nothing for it but to wait for some new facts. Now, the study of a large series of carefully conducted murders brings into view an almost invariable phenomenon. The cautious murderer, in his anxiety to make himself secure, does too much; and it is this excess of
precaution that leads to detection. It happens constantly; indeed, I may say that it always happens—in those murders that are detected; of those that are not we say nothing—and I had strong hopes that it would happen in this case. And it did.

‘At the very moment when my client’s case seemed almost hopeless, some human remains were discovered at Sidcup. I read the account of the discovery in the evening paper, and, scanty as the report was, it recorded enough facts to convince me that the inevitable mistake had been made.’

‘Did it, indeed?’ said Mr. Jellicoe. ‘A mere, inexpert, hearsay report! I should have supposed it to be quite valueless from a scientific point of view.’

‘So it was,’ said Thorndyke. ‘But it gave the date of the discovery and the locality, and it also mentioned what bones had been found. Which were all vital facts. Take the question of time. These remains, after lying perdu for two years, suddenly come to light just as the parties—who have also been lying perdu—have begun to take action in respect of the will; in fact, within a week or two of the hearing of the application. It was certainly a remarkable coincidence. And when the circumstances that occasioned the discovery were considered, the coincidence became more remarkable still. For these remains were found on land actually belonging to John Bellingham, and their discovery resulted from certain operations (the clearing of the watercress-beds) carried out on behalf of the absent landlord. But by whose orders were those works undertaken? Clearly by the orders of the landlord’s agent. But the landlord’s agent was known to be Mr. Jellicoe. Therefore these remains were brought to light at this peculiarly opportune moment by the action of Mr. Jellicoe. The coincidence, I say again, was very remarkable.

‘But what instantly arrested my attention on reading the newspaper report was the unusual manner in which the arm had been separated; for, beside the bones of the arm proper, there were those of what anatomists call the “shoulder-girdle”—the shoulder-blade and collar-bone. This was very remarkable. It seemed to suggest a knowledge of anatomy, and yet no murderer, even if he possessed such knowledge, would make a display of it on such an occasion. It seemed to me that there must be some other explanation. Accordingly, when other remains had come to light and all had been collected at Woodford, I asked my friend Berkeley to go down there and inspect them. He did so, and this is what he found:

‘Both arms had been detached in the same peculiar manner; both were complete, and all the bones were from the same body. The bones were quite clean—of soft structures, I mean. There were no cuts, scratches or marks on them. There was not a trace of adipocere—the peculiar waxy soap that forms in bodies that decay in water or in a damp situation. The right hand had been detached at the time the arm was thrown into the pond, and the left ring finger had been separated and had vanished. This latter fact had attracted my attention from the first, but I will leave its consideration for the moment and return to it later.’

‘How did you discover that the hand had been detached?’ Mr. Jellicoe asked.

‘By the submersion marks,’ replied Thorndyke. ‘It was lying on the bottom of the pond in a position which would have been impossible if it had been attached to the arm.’

‘You interest me exceedingly,’ said Mr. Jellicoe. ‘It appears that a medico-legal expert finds “books in the running brooks, sermons in bones, and evidence in everything.” But don’t let me interrupt you.’

‘Doctor Berkeley’s observations,’ Thorndyke resumed, ‘together with the medical evidence at the inquest, led me to certain conclusions.

‘Let me state the facts which were disclosed.

‘The remains which had been assembled formed a complete human skeleton with the exception of the skull, one finger, and the legs from the knee to the ankle, including both knee-caps. This was a very impressive fact; for the bones that were missing included all those which could have been identified as belonging or not belonging to John Bellingham; and the bones that were present were the unidentifiable remainder.

‘It had a suspicious appearance of selection.

‘But the parts that were present were also curiously suggestive. In all cases the mode of dismemberment was peculiar; for an ordinary person would have divided the knee-joint leaving the kneecap attached to the thigh, whereas it had evidently been left attached to the shin-bone; and the head would most probably have been removed by cutting through the neck instead of being neatly detached from the spine. And all these bones were almost entirely free from marks or scratches such as would naturally occur in an ordinary dismemberment, and all were quite free from adipocere. And now as to the conclusions which I drew from these facts. First, there was the peculiar grouping of the bones. What was the meaning of that? Well, the idea of a punctilious anatomist was obviously absurd, and I put it aside. But was there any other explanation? Yes, there was. The bones had appeared in the natural groups that are held together by ligaments; and they had separated at points where they were attached principally by muscles. The knee-cap, for instance, which really belongs to the thigh, is attached to it by muscle, but to the shin-bone by a stout ligament. And so with the bones of the arm; they are connected to one another by ligaments; but to the trunk only by muscle, excepting at one end of the collarbone.

But this was a very significant fact. Ligament decays much more slowly than muscle, so that in a body of which the muscles had largely decayed the bones might still be held together by ligament. The peculiar grouping therefore suggested that the body had been partly reduced to a skeleton before it was dismembered; that it had then been merely pulled apart and not divided with a knife.

‘This suggestion was remarkably confirmed by the total absence of knife-cuts or scratches.
Then there was the fact that all the bones were quite free from adipocere. Now, if an arm or a thigh should be deposited in water and left undisturbed to decay, it is certain that large masses of adipocere would be formed. Probably more than half of the flesh would be converted into this substance. The absence of adipocere therefore proved that the bulk of the flesh had disappeared or been removed from the bones before they were deposited in the pond. That, in fact, it was not a body, but a skeleton, that had been deposited.

But what kind of skeleton? If it was the recent skeleton of a murdered man, then the bones had been carefully stripped of flesh so as to leave the ligaments intact. But this was highly improbable; for there could be no object in preserving the ligaments. And the absence of scratches was against this view.

Then they did not appear to be graveyard bones. The collection was too complete. It is very rare to find a graveyard skeleton of which many of the small bones are not missing. And such bones are usually more or less weathered or friable.

They did not appear to be bones such as may be bought at an osteological dealer’s, for these usually have perforations to admit the macerating fluid to the marrow cavities. Dealers’ bones, too, are very seldom all from the same body; and the small bones of the hand are drilled with holes to enable them to be strung on catgut.

They were not dissecting-room bones, as there was no trace of red lead in the openings for the nutrient arteries.

What the appearances did suggest was that these were parts of a body which had decayed in a very dry atmosphere (in which no adipocere would be formed), and which had been pulled or broken apart. Also that the ligaments which held the body—or rather skeleton—together were brittle and friable as suggested by the detached hand, which had probably broken off accidentally. But the only kind of body that completely answered this description is an Egyptian mummy. A mummy, it is true, has been more or less preserved; but on exposure to the air of such a climate as ours it perishes rapidly, the ligaments being the last of the soft parts to disappear.

The hypothesis that these bones were parts of a mummy naturally suggested Mr. Jellicoe. If he had murdered John Bellingham and concealed his body in the mummy-case, he would have a spare mummy on his hands, and that mummy would have been exposed to the air and to somewhat rough handling.

A very interesting circumstance connected with these remains was that the ring finger was missing. Now, fingers have on sundry occasions been detached from dead hands for the sake of the rings on them. But in such cases the object has been to secure a valuable ring uninjured. If this hand was the hand of John Bellingham, there was no such object. The purpose was to prevent identification; and that purpose would have been more easily, and much more completely, achieved by sacrificing the ring, by filing through it or breaking it off the finger. The appearances, therefore, did not quite agree with the apparent purpose.

Then, could there be any other purpose with which they agreed better? Yes, there could.

If it had happened that John Bellingham were known to have worn a ring on that finger, and especially if that ring fitted tightly, the removal of the finger would serve a very useful purpose. It would create an impression that the finger had been removed on account of a ring, to prevent identification; which impression would, in turn, produce a suspicion that the hand was that of John Bellingham. And yet it would not be evidence that could be used to establish identity. Now, if Mr. Jellicoe were the murderer and had the body hidden elsewhere, vague suspicion would be precisely what he would desire, and positive evidence what he would wish to avoid.

It transpired later that John Bellingham did wear a ring on that finger and that the ring fitted very tightly. Whence it followed that the absence of the finger was an additional point tending to implicate Mr. Jellicoe.

And now let us briefly review this mass of evidence. You will see that it consists of a multitude of items, each either trivial or speculative. Up to the time of the actual discovery I had not a single crucial fact, nor any clue as to motive. But slight as the individual points of evidence were, they pointed with impressive unanimity to one person—Mr. Jellicoe. Thus:

The person who had the opportunity to commit murder and dispose of the body was Mr. Jellicoe.

The deceased was last certainly seen alive with Mr. Jellicoe.

An unidentified human body was delivered to the Museum by Mr. Jellicoe.

The only person who could have a motive for personating the deceased was Mr. Jellicoe.

The only known person who could possibly have done so was Mr. Jellicoe.

One of the two persons who could have had a motive for dropping the scarab was Mr. Jellicoe. The person who found that scarab was Mr. Jellicoe, although, owing to his defective eyesight and his spectacles, he was the most unlikely person of those present to find it.

The person who was responsible for the execution of the defective will was Mr. Jellicoe.

Then as to the remains. They were apparently not those of John Bellingham, but parts of a particular kind of body. But the only person who was known to have had such a body in his possession was Mr. Jellicoe.

The only person who could have had any motive for substituting those remains for the remains of the deceased was Mr. Jellicoe.

Finally, the person who caused the discovery of those remains at that singularly opportune moment was Mr. Jellicoe.
‘This was the sum of the evidence that was in my possession up to the time of the hearing and, indeed, for some time after, and it was not enough to act upon. But when the case had been heard in Court, it was evident either that the proceedings would be abandoned—which was unlikely—or that there would be new developments.

‘I watched the progress of events with profound interest. An attempt had been made (by Mr. Jellicoe or some other person) to get the will administered without producing the body of John Bellingham; and that attempt had failed. The coroner’s jury had refused to identify the remains; the Probate Court had refused to presume the death of the testator. As affairs stood the will could not be administered.

‘What would be the next move?

‘It was virtually certain that it would consist in the production of something which would identify the unrecognised remains as those of the testator.

‘But what would that something be?

‘The answer to that question would contain the answer to another question: Was my solution of the mystery the true solution?

‘If I was wrong, it was possible that some of the undoubtedly genuine bones of John Bellingham might presently be discovered; for instance, the skull, the knee-cap, or the left fibula, by any of which the remains could be positively identified.

‘If I was right, only one thing could possibly happen. Mr. Jellicoe would have to play the trump card that he had been holding back in case the Court should refuse the application; a card that he was evidently reluctant to play.

‘He would have to produce the bones of the mummy’s finger, together with John Bellingham’s ring. No other course was possible.

‘But not only would the bones and the ring have to be found together. They would have to be found in a place which was accessible to Mr. Jellicoe, and so far under his control that he could determine the exact time when the discovery should be made.

‘I waited patiently for the answer to my question. Was I right or was I wrong?

‘And, in due course, the answer came.

‘The bones and the ring were discovered in the well in the grounds of Godfrey Bellingham’s late house. That house was the property of John Bellingham. Mr. Jellicoe was John Bellingham’s agent. Hence it was practically certain that the date on which the well was emptied was settled by Mr. Jellicoe.

‘The oracle had spoken.

‘The discovery proved conclusively that the bones were not those of John Bellingham (for if they had been the ring would have been unnecessary for identification). But if the bones were not John Bellingham’s, the ring was; from which followed the important corollary that whoever had deposited those bones in the well had had possession of the body of John Bellingham. And there could be no doubt that that person was Mr. Jellicoe.

‘On receiving this final confirmation of my conclusions, I applied forthwith to Doctor Norbury for permission to examine the mummy of Sebekhotep, with the result that you are already acquainted with.’

As Thorndyke concluded, Mr. Jellicoe regarded him thoughtfully for a moment and then said: ‘You have given us a most complete and lucid exposition of your method of investigation, sir. I have enjoyed it exceedingly, and should have profited by it hereafter—under other circumstances. Are you sure you won’t allow me to fill your glass?’ He touched the stopper of the decanter, and Inspector Badger ostentatiously consulted his watch.

‘Time is running on, I fear,’ said Mr. Jellicoe.

‘It is, indeed,’ Badger assented emphatically.

‘Well, I need not detain you long,’ said the lawyer. ‘My statement is a narration of events. But I desire to make it, and you, no doubt, will be interested to hear it.’

He opened the silver case and selected a fresh cigarette, which, however, he did not light. Inspector Badger produced a funeral notebook, which he laid open on his knee; and the rest of us settled ourselves in our chairs with no little curiosity to hear Mr. Jellicoe’s statement.

XX. — THE END OF THE CASE

A PROFOUND silence had fallen on the room and its occupants. Mr. Jellicoe sat with his eyes fixed on the table as if deep in thought, the unlighted cigarette in one hand, the other grasping the tumbler of water. Presently Inspector Badger coughed impatiently and he looked up. ‘I beg your pardon, gentlemen,’ he said. ‘I am keeping you waiting.’

He took a sip from the tumbler, opened a match-box and took out a match, but apparently altering his mind, laid it down and commenced:
‘The unfortunate affair which has brought you here to-night, had its origin ten years ago. At that time my friend Hurst became suddenly involved in financial difficulties—am I speaking too fast for you, Mr. Badger?’

‘No not at all,’ replied Badger. ‘I am taking it down in shorthand.’

‘Thank you,’ said Mr. Jellicoe. ‘He became involved in serious difficulties and came to me for assistance. He wished to borrow five thousand pounds to enable him to meet his engagements. I had a certain amount of money at my disposal, but I did not consider Hurst’s security satisfactory; accordingly I felt compelled to refuse. But on the very next day, John Bellingham called on me with a draft of his will which he wished me to look over before it was executed.

‘It was an absurd will, and I nearly told him so; but then an idea occurred to me in connection with Hurst. It was obvious to me, as soon as I glanced through the will, that, if the burial clause was left as the testator had drafted it, Hurst had a very good chance of inheriting the property; and, as I was named as the executor I should be able to give full effect to that clause. Accordingly, I asked for a few days to consider the will, and then I called upon Hurst and made a proposal to him; which was this: That I should advance him five thousand pounds without security; that I should ask for no repayment, but that he should assign to me any interest that he might have or acquire in the estate of John Bellingham up to ten thousand pounds, or two-thirds of any sum that he might inherit if over that amount. He asked if John had yet made any will, and I replied, quite correctly, that he had not. He inquired if I knew what testamentary arrangements John intended to make, and again I answered, quite correctly, that I believed John proposed to devise the bulk of his property to his brother, Godfrey.

‘Thereupon, Hurst accepted my proposal; I made him the advance and he executed the assignment. After a few days’ delay, I passed the will as satisfactory. The actual document was written from the draft by the testator himself; and a fortnight after Hurst had executed the assignment, John signed the will in my office. By the provisions of that will I stood an excellent chance of becoming virtually the principal beneficiary, unless Godfrey should contest Hurst’s claim and the Court should override the conditions of clause two.

‘You will now understand the motives which governed my subsequent actions. You will also see, Doctor Thorndyke, how very near to the truth your reasoning carried you; and you will understand, as I wish you to do, that Mr. Hurst was no party to any of those proceedings which I am about to describe.

‘Coming now to the interview in Queen Square in October, nineteen hundred and two, you are aware of the general circumstances from my evidence in Court, which was literally correct up to a certain point. The interview took place in a room on the third floor, in which were stored the cases which John had brought with him from Egypt. The mummy was unpacked, as were some other objects that he was not offering to the Museum, but several cases were still unopened. At the conclusion of the interview I accompanied Doctor Norbury down to the street door, and we stood on the doorstep conversing for perhaps a quarter of an hour. Then Doctor Norbury went away and I returned upstairs.

‘Now the house in Queen Square is virtually a museum. The upper part is separated from the lower by a massive door which opens from the hall and gives access to the staircase and which is fitted with a Chubb night-latch. There are two latch-keys, of which John used to keep one and I the other. You will find them both in the safe behind me. The caretaker had no key and no access to the upper part of the house unless admitted by one of us.

‘At the time when I came in, after Doctor Norbury had left, the caretaker was in the cellar, where I could hear him breaking coke for the hot-water furnace. I had left John on the third floor opening some of the packing-cases by the light of a lamp with a tool somewhat like a plasterer’s hammer; that is, a hammer with a small axe-blade at the reverse of the head. As I stood talking to Doctor Norbury, I could hear him knocking out the nails and wrenching up the lids; and when I entered the doorway leading to the stairs, I could still hear him. Just as I closed the staircase door behind me, I heard a rumbling noise from above; then all was still.

‘I went up the stairs to the second floor, where, as the staircase was all in darkness, I stopped to light the gas. As I turned to ascend the next flight, I saw a hand projecting over the edge of the halfway landing. I ran up the stairs, and there, on the landing, I saw John lying huddled up in a heap at the foot of the top flight. There was a wound at the side of his forehead from which a little blood was trickling. The case-opener lay on the floor close by him and there was blood on the axe-blade. When I looked up the stairs I saw a rag of torn matting over the top stair.

‘It was quite easy to see what had happened. He had walked quickly out on the landing with the case-opener in his hand. His foot had caught in the torn matting and he had pitched head foremost down the stairs still holding the case-opener. He had fallen so that his head had come down on the upturned edge of the axe-blade; he had then rolled over and the case-opener had dropped from his hand.

‘I lit a wax match and stooped down to look at him. His head was in a very peculiar position, which made me suspect that his neck was broken. There was extremely little bleeding from the wound; he was perfectly motionless; I could detect no sign of breathing; and I felt no doubt that he was dead.

‘It was an exceedingly regrettable affair, and it placed me, as I perceived at once, in an extremely awkward position. My first impulse was to send the caretaker for a doctor and a policeman; but a moment’s reflection convinced me that there were serious objections to this course.

‘There was nothing to show that I had not, myself, knocked him down with the case-opener. Of course, there was nothing to show that I had; but we were alone in the house with the exception of the caretaker, who was down in the basement out
of earshot.

'There would be an inquest. At the inquest inquiries would be made as to the will which was known to exist. But as soon as the will was produced, Hurst would become suspicious. He would probably make a statement to the coroner and I should be charged with the murder. Or, even if I were not charged, Hurst would suspect me and would probably repudiate the assignment; and, under the circumstances, it would be practically impossible for me to enforce it. He would refuse to pay and I could not take my claim into Court.

I sat down on the stairs just above poor John’s body and considered the matter in detail. At the worst, I stood a fair chance of hanging; at the best, I stood to lose close upon fifty thousand pounds. These were not pleasant alternatives.

'Supposing, on the other hand, I concealed the body and gave out that John had gone to Paris. There was, of course, the risk of discovery, in which case I should certainly be convicted of the murder. But if no discovery occurred, I was not only safe from suspicion, but I secured the fifty thousand pounds. In either case there was considerable risk, but in one there was the certainty of loss, whereas in the other there was a material advantage to justify the risk. The question was whether it would be possible to conceal the body. If it were, then the contingent profit was worth the slight additional risk. But a human body is a very difficult thing to dispose of, especially to a person of so little scientific culture as myself.

'It is curious that I considered this question for a quite considerable time before the obvious solution presented itself. I turned over at least a dozen methods of disposing of the body, and rejected them all as impracticable. Then, suddenly, I remembered the mummy upstairs.

'At first it only occurred to me as a fantastic possibility that I could conceal the body in the mummy-case. But as I turned over the idea I began to see that it was really practicable; and not only practicable but easy; and not only easy but eminently safe. If once the mummy-case was in the Museum, I was rid of it for ever.

'The circumstances were, as you, sir, have justly observed, singularly favourable. There would be no hue and cry, no hurry, no anxiety; but ample time for all the necessary preparations. Then the mummy-case itself was curiously suitable. Its length was ample, as I knew from having measured it. It was a cartonnage of rather flexible material and had an opening behind, secured with a lacing so that it could be opened without injury. Nothing need be cut but the lacing, which could be replaced. A little damage might be done in extracting the mummy and in introducing the deceased; but such cracks as might occur would be of no importance. For here again Fortune favoured me. The whole of the back of the mummy-case was coated with bitumen, and it would be easy when once the deceased was safely inside to apply a fresh coat, which would cover up not only the cracks but also the new lacing.

'After careful consideration, I decided to adopt the plan. I went downstairs and sent the caretaker on an errand to the Law Courts. Then I returned and carried the deceased up to one of the third-floor rooms, where I removed his clothes and laid him out on a long packing-case in the position in which he would lie in the mummy-case. I folded his clothes neatly and packed them, with the exception of his boots, in a suit-case that he had been taking to Paris and which contained nothing but his night-clothes, toilet articles, and a change of linen. By the time I had done this and thoroughly washed the oilcloth on the stairs and landing, the caretaker had returned. I informed him that Mr. Bellingham had started for Paris and then I went home. The upper part of the house was, of course, secured by the Chubb lock, but I had also—ex abundantia caulula—locked the door of the room in which I had deposited the deceased.

'I had, of course, some knowledge of the methods of embalming, but principally of those employed by the ancients. Hence, on the following day, I went to the British Museum library and consulted the most recent works on the subject; and exceedingly interesting they were, as showing the remarkable improvements that modern knowledge has effected in this ancient art. I need not trouble you with details that are familiar to you. The process that I selected as the simplest for a beginner was that of formalin injection, and I went straight from the Museum to purchase the necessary materials. I did not, however, buy an embalming syringe: the book stated that an ordinary anatomical injecting syringe would answer the same purpose, and I thought it a more discreet purchase.

'I fear that I bungled the injection terribly, although I had carefully studied the plates in a treatise on anatomy—Gray’s, I think. However, if my methods were clumsy, they were quite effectual. I carried out the process on the evening of the third day; and when I looked up the house that night, I had the satisfaction of knowing that poor John’s remains were secure from corruption and decay.

'But this was not enough. The great weight of a fresh body as compared with that of a mummy would be immediately noticed by those who had the handling of the mummy-case. Moreover, the damp from the body would quickly ruin the cartonnage and would cause a steamy film on the inside of the glass case in which it would be exhibited. And this would probably lead to an examination. Clearly, then, it was necessary that the remains of the deceased should be thoroughly dried before they were enclosed in the cartonnage.

'Here my unfortunate deficiency in scientific knowledge was a great drawback. I had no idea how this result would be achieved and, in the end, was compelled to consult a taxidermist, to whom I represented that I wished to collect some small animals and reptiles and rapidly dry them for convenience of transport. By this person I was advised to immerse the dead animals in a jar of methylated spirit for a week and then expose them in a current of warm, dry air.

'But the plan of immersing the remains of the deceased in ajar of methylated spirit was obviously impracticable. However, I bethought me that we had in our collection a porphyry sarcophagus, the cavity of which had been shaped to receive a small mummy in its case. I tried the deceased in the sarcophagus and found that he just fitted the cavity loosely. I
obtained a few gallons of methylated spirit, which I poured into the cavity, just covering the body, and then I put on the lid and luted it down air-tight with putty. I trust I do not weary you with these particulars?

'I'll ask you to cut it as short as you can,' Mr. Jellicoe, said Badger. 'It has been a long yarn and time is running on.'

'For my part,' said Thorndyke, 'I find these details deeply interesting and instructive. They fill in the outline that I had drawn by inference.'

'Precisely,' said Mr. Jellicoe; 'then I will proceed.

'I left the deceased soaking in the spirit for a fortnight and then took him out, wiped him dry, and laid him on four cane-bottomed chairs just over the hot-water pipes, and I let a free current of air pass through the room. The result interested me exceedingly. By the end of the third day the hands and feet had become quite dry and shrivelled and horny—so that the ring actually dropped off the shrunken finger—the nose looked like a fold of parchment; and the skin of the body was so dry and smooth that you could have engrossed a lease on it. For the first day or two I turned the deceased at intervals so that he should dry evenly, and then I proceeded to get the case ready. I divided the lacing and extracted the mummy with great care—with great care as to the case, I mean; for the mummy suffered some injury in the extraction. It was very badly embalmed, and so brittle that it broke in several places while I was getting it out; and when I unrolled it the head separated and both the arms came off.

'On the sixth day after the removal from the sarcophagus, I took the bandages that I had removed from Sebekhotep and very carefully wrapped the deceased in them, sprinkling powdered myrrh and gum benzoin freely on the body and between the folds of the wrappings to disguise the faint odour of the spirit and the formalin that still lingered about the body. When the wrappings had been applied, the deceased really had a most workmanlike appearance; he would have looked quite well in a glass case even without the cartonnage, and I felt almost regretful at having to put him out of sight for ever.

'It was a difficult business getting him into the case without assistance, and I cracked the cartonnage badly in several places before he was safely enclosed. But I got him in at last, and then, when I had closed up the case with a new lacing, I applied a fresh layer of bitumen which effectually covered up the cracks and the new cord. A dusty cloth dabbed over the bitumen when it was dry disguised its newness, and the cartonnage with its tenant was ready for delivery. I notified Doctor Norbury of the fact, and five days later he came and removed it to the Museum.

'Now that the main difficulty was disposed of, I began to consider the further difficulty to which you, sir, have alluded with such admirable perspicuity. It was necessary that John Bellingham should make one more appearance in public before sinking into final oblivion.

'Accordingly, I devised the visit to Hurst's house, which was calculated to serve two purposes. It created a satisfactory date for the disappearance, eliminating me from any connection with it, and by throwing some suspicion on Hurst it would make him more amenable—less likely to dispute my claim when he learned the provisions of the will.

'The affair was quite simple. I knew that Hurst had changed his servants since I was last at his house, and I knew his habits. On that day I took the suit-case to Charing Cross and deposited it in the cloak-room, called at Hurst's office to make sure that he was there, and went from thence direct to Cannon Street and caught the train to Eltham. On arriving at the house, I took the precaution to remove my spectacles—the only distinctive feature of my exterior—and was duly shown into the study at my request. As soon as the housemaid had left the room I quietly let myself out by the French window, which I closed behind me but could not fasten, went out at the side gate and closed that also behind me, holding the bolt of the latch back with my pocket-knife so that I need not slam the gate to shut it.

'The other events of that day, including the dropping of the scarab, I need not describe, as they are known to you. But I may fitly make a few remarks on the unfortunate tactical error into which I fell in respect of the bones. That error arose, as you have doubtless perceived, from the lawyer's incurable habit of underestimating the scientific expert. I had no idea mere bones were capable of furnishing so much information to a man of science.

'The way in which the affair came about was this: the damaged mummy of Sebekhotep, perishing gradually by exposure to the air, was not only an eyesore to me: it was a definite danger. It was the only remaining link between me and the disappearance. I resolved to rid of it and cast about for some means of destroying it. And then, in an evil moment, the idea of utilising it occurred to me.

'There was an undoubted danger that the Court might refuse to presume death after so short an interval; and if the permission should be postponed, the will might never be administered during my lifetime. Hence, if these bones of Sebekhotep could be made to simulate the remains of the deceased testator, a definite good would be achieved. But I knew that the entire skeleton could never be mistaken for his. The deceased had broken his knee-caps and damaged his ankle, injuries which I assumed would leave some permanent trace. But if a judicious selection of the bones were deposited in a suitable place, together with some object clearly identifiable as appertaining to the deceased, it seemed to me that the difficulty would be met. I need not trouble you with details. The course which I adopted is known to you with the attendant circumstances, even to the accidental detachment of the right hand—which broke off as I was packing the arm in my handbag. Erroneous as that course was, it would have been successful but for the unforeseen contingency of your being retained in the case.

'Thus, for nearly two years, I remained in complete security. From time to time I dropped in at the Museum to see if the deceased was keeping in good condition; and on those occasions I used to reflect with satisfaction on the gratifying
circumstance—accidental though it was—that his wishes, as expressed (very imperfectly) in clause two, had been fully complied with, and that without prejudice to my interests.

The awakening came on that evening when I saw you at the Temple gate talking with Doctor Berkeley. I suspected immediately that something was gone amiss and that it was too late to take any useful action. Since then, I have waited here in hourly expectation of this visit. And now the time has come. You have made the winning move and it remains only for me to pay my debts like an honest gambler.

He paused and quietly lit his cigarette. Inspector Badger yawned and put away his notebook.

‘Have you done, Mr. Jellicoe?’ the inspector asked. ‘I want to carry out my contract to the letter, you know, though it’s getting devilish late.’

Mr. Jellicoe took his cigarette from his mouth and drank a glass of water.

‘I forgot to ask,’ he said, ‘whether you unrolled the mummy—if I may apply the term to the imperfectly treated remains of my deceased client.’

‘I did not open the mummy-case,’ replied Thorndyke.

‘You did not!’ exclaimed Mr. Jellicoe. ‘Then how did you verify your suspicions?’

‘I took an X-ray photograph.’

‘Ah! Indeed!’ Mr. Jellicoe pondered for some moments. ‘Astonishing!’ he murmured; ‘and most ingenious. The resources of science at the present day are truly wonderful.’

‘Is there anything more that you want to say?’ asked Badger; ‘because if you don’t, time’s up.’

‘Anything more?’ Mr. Jellicoe repeated slowly; ‘anything more? No—I—think—think—the time—is—up. Yes—the—the—time—’

He broke off and sat with a strange look fixed on Thorndyke.

His face had suddenly undergone a curious change. It looked shrunken and cadaverous and his lips had assumed a peculiar cherry-red colour.

‘Is anything the matter, Mr. Jellicoe?’ Badger asked uneasily. ‘Are you not feeling well, sir?’

Mr. Jellicoe did not appear to have heard the question, for he returned no answer, but sat motionless, leaning back in his chair, with his hands spread out on the table and his strangely intent gaze bent on Thorndyke.

Suddenly his head dropped on his breast and his body seemed to collapse; and as with one accord we sprang to our feet, he slid forward off his chair and disappeared under the table.

‘Good Lord! The man’s fainted!’ exclaimed Badger.

In a moment he was down on his hands and knees, trembling with excitement, groping under the table. He dragged the unconscious lawyer out into the light and knelt over him, staring into his face.

‘What’s the matter with him, Doctor?’ he asked, looking up at Thorndyke. ‘Is it apoplexy? Or is it a heart attack, think you?’

Thorndyke shook his head, though he stooped and put his fingers on the unconscious man’s wrist.

‘Prussic acid or potassium cyanide is what the appearances suggest,’ he replied.

‘But can’t you do anything?’ demanded the inspector.

Thorndyke dropped the arm, which fell limply to the floor.

‘You can’t do much for a dead man,’ he said.

‘Dead! Then he has slipped through our fingers after all!’

‘He has anticipated the sentence. That is all.’ Thorndyke spoke in an even, impassive tone which struck me as rather strange, considering the suddenness of the tragedy, as did also the complete absence of surprise in his manner. He seemed to treat the occurrence as a perfectly natural one.

Not so Inspector Badger; who rose to his feet and stood with his hands thrust into his pockets scowling sullenly down at the dead lawyer.

‘I was an infernal fool to agree to his blasted conditions,’ he growled savagely.

‘Nonsense,’ said Thorndyke. ‘If you had broken in you would have found a dead man. As it was you found a live man and obtained an important statement. You acted quite properly.’

‘How do you suppose he managed it?’ asked Badger.

Thorndyke held out his hand.

‘Let us look at his cigarette case,’ said he.
Badger extracted the little silver case from the dead man's pocket and opened it. There were five cigarettes in it, two of which were plain, while the other three were gold-tipped. Thorndyke took out one of each kind and gently pinched their ends. The gold-tipped one he returned; the plain one he tore through, about a quarter of an inch from the end; when two little black tabloids dropped out on to the table. Badger eagerly picked one up and was about to smell it when Thorndyke grasped his wrist. 'Be careful,' said he; and when he had cautiously sniffed at the tabloid—held at a safe distance from his nose—he added: 'Yes, potassium cyanide. I thought so when his lips turned that queer colour. It was in that last cigarette; you can see that he has bitten the end off.'

For some time we stood silently looking down at the still form stretched on the floor. Presently Badger looked up.

'As you pass the porter's lodge on your way out,' said he, 'you might just drop in and tell him to send a constable to me.'

'Very well,' said Thorndyke. 'And by the way, Badger, you had better tip that sherry back into the decanter and put it under lock and key, or else pour it out of the window.'

'Gad, yes!' exclaimed the inspector. 'I'm glad you mentioned it. We might have had an inquest on a constable as well as a lawyer. Good-night, gentlemen, if you are off.'

We went out and left him with his prisoner—passive enough, indeed, according to his ambiguously worded promise. As we passed through the gateway Thorndyke gave the inspector's message, curtly and without comment, to the gaping porter, and then we issued forth into Chancery Lane.

We were all silent and very grave, and I thought that Thorndyke seemed somewhat moved. Perhaps Mr. Jellicoe's last intent look—which I suspect he knew to be the look of a dying man—lingered in his memory as it did in mine. Half-way down Chancery Lane he spoke for the first time; and then it was only to ejaculate, 'Poor devil!'

Jervis took him up. 'He was a consummate villain, Thorndyke.'

'Hardly that,' was the reply. 'I should rather say that he was non-moral. He acted without malice and without scruple or remorse. His conduct exhibited a passionateless expediency which was dreadful because utterly inhuman. But he was a strong man—a courageous, self-contained man, and I had been better pleased if it could have been ordained that some other hand than mine should let the axe fall.'

Thorndyke's compunction may appear strange and inconsistent, but yet his feeling was also my own. Great as was the misery and suffering that this inscrutable man had brought into the lives of those I loved, I forgave him; and in his downfall forgot the callous relentlesseness with which he had pursued his evil purpose. For it was he who had brought Ruth into my life; who had opened for me the Paradise of Love into which I had just entered. And so my thoughts turned away from the still shape that lay on the floor of the stately old room in Lincoln's Inn, away to the sunny vista of the future, where I should walk hand in hand with Ruth until my time, too, should come; until I, too, like the grim lawyer, should hear the solemn evening bell bidding me put out into the darkness of the silent sea.
I. — THE CASE OF OSCAR BRODSKI

PART I. — THE MECHANISM OF CRIME

A SURPRISING amount of nonsense has been talked about conscience. On the one hand remorse (or the “again-bite,” as certain scholars of ultra-Teutonic leanings would prefer to call it); on the other hand “an easy conscience”: these have been accepted as the determining factors of happiness or the reverse.

Of course there is an element of truth in the “easy conscience” view, but it begs the whole question. A particularly hardy conscience may be quite easy under the most unfavourable conditions—conditions in which the more feeble conscience might be severely afflicted with the “again-bite.” And, then, it seems to be the fact that some fortunate persons have no conscience at all; a negative gift that raises them above the mental vicissitudes of the common herd of humanity.

Now, Silas Hickler was a case in point. No one, looking into his cheerful, round face, beaming with benevolence and wreathed in perpetual smiles, would have imagined him to be a criminal. Least of all, his worthy, high-church housekeeper, who was a witness to his unrivelling amiability, who constantly heard him carolling light-heartedly about the house and noted his appreciative zest at meal-times.

Yet it is a fact that Silas earned his modest, though comfortable, income by the gentle art of burglary. A precarious trade and risky withal, yet not so very hazardous if pursued with judgment and moderation. And Silas was eminently a man of judgment. He worked invariably alone. He kept his own counsel. No confederate had he to turn King’s Evidence at a pinch; no one he knew would bounce off in a fit of temper to Scotland Yard. Nor was he greedy and thriftless, as most criminals are. His “scoops” were few and far between, carefully planned, secretly executed, and the proceeds judiciously invested in “weekly property.”

In early life Silas had been connected with the diamond industry, and he still did a little rather irregular dealing. In the trade he was suspected of transactions with I.B.B.’s, and one or two indiscreet dealers had gone so far as to whisper the ominous word “fence.” But Silas smiled a benevolent smile and went his way. He knew what he knew, and his clients in Amsterdam were not inquisitive.

Such was Silas Hickler. As he strolled round his garden in the dusk of an October evening, he seemed the very type of modest, middle-class prosperity. He was dressed in the travelling suit that he wore on his little continental trips; his bag was packed and stood in readiness on the sitting-room sofa. A parcel of diamonds (purchased honestly, though without impertinent questions, at Southampton) was in the inside pocket of his waistcoat, and another more valuable parcel was stowed in a cavity in the heel of his right boot. In an hour and a half it would be time for him to set out to catch the boat train at the junction; meanwhile there was nothing to do but to stroll round the fading garden and consider how he should invest the proceeds of the impending deal. His housekeeper had gone over to Welham for the week’s shopping, and would probably not be back until eleven o’clock. He was alone in the premises and just a trifle dull.

He was about to turn into the house when his ear caught the sound of footsteps on the unmade road that passed the end of the garden. He paused and listened. There was no other dwelling near, and the road led nowhere, fading away into the waste land beyond the house. Could this be a visitor? It seemed unlikely, for visitors were few at Silas Hickler’s house. Meanwhile the footsteps continued to approach, ringing out with increasing loudness on the hard, stony path.

Silas strolled down to the gate, and, leaning on it, looked out with some curiosity. Presently a glow of light showed him the face of a man, apparently lighting his pipe; then a dim figure detached itself from the enveloping gloom, advanced towards him and halted opposite the garden. The stranger removed a cigarette from his mouth and, blowing out a cloud of smoke, asked—

“Can you tell me if this road will take me to Badsham Junction?”
“No,” replied Hickler, “but there is a footpath farther on that leads to the station.”

“Footpath!” growled the stranger. “I’ve had enough of footpaths. I came down from town to Catley intending to walk across to the junction. I started along the road, and then some fool directed me to a short cut, with the result that I have been blundering about in the dark for the last half-hour. My sight isn’t very good, you know,” he added.

“What train do you want to catch?” asked Hickler.

“Seven fifty-eight,” was the reply.

“I am going to catch that train myself,” said Silas, “but I shan’t be starting for another hour. The station is only three-quarters of a mile from here. If you like to come in and take a rest, we can walk down together and then you’ll be sure of not missing your way.”

“It’s very good of you,” said the stranger, peering, with spectacled eyes, at the dark house, “but—I think—?”

“Might as well wait here as at the station,” said Silas in his genial way, holding the gate open, and the stranger, after a momentary hesitation, entered and, flinging away his cigarette, followed him to the door of the cottage.

The sitting-room was in darkness, save for the dull glow of the expiring fire, but, entering before his guest, Silas applied a match to the lamp that hung from the ceiling. As the flame leaped up, flooding the little interior with light, the two men regarded one another with mutual curiosity.

“Brodski, by Jingo!” was Hickler’s silent commentary, as he looked at his guest. “Doesn’t know me, evidently—wouldn’t, of course, after all these years and with his bad eyesight. Take a seat, sir,” he added aloud. “Will you join me in a little refreshment to while away the time?”

Brodski murmured an indistinct acceptance, and, as his host turned to open a cupboard, he deposited his hat (a hard, grey felt) on a chair in a corner, placed his bag on the edge of the table, resting his umbrella against it, and sat down in a small arm-chair.

“Have a biscuit?” said Hickler, as he placed a whisky-bottle on the table together with a couple of his best star-pattern tumblers and a siphon.

“Thanks, I think I will,” said Brodski. “The railway journey and all this confounded tramping about, you know—?”

“Yes,” agreed Silas. “Doesn’t do to start with an empty stomach. Hope you don’t mind oat-cakes; I see they’re the only biscuits I have.”

Brodski hastened to assure him that oat-cakes were his special and peculiar fancy, and in confirmation, having mixed himself a stiff jorum, he fell to upon the biscuits with evident gusto.

Brodski was a deliberate feeder, and at present appeared to be somewhat sharp set. His measured munching being unfavourable to conversation, most of the talking fell to Silas; and, for once, that genial transgressor found the task embarrassing. The natural thing would have been to discuss his guest’s destination and perhaps the object of his journey; but this was precisely what Hickler avoided doing. For he knew both, and instinct told him to keep his knowledge to himself.

Brodski was a diamond merchant of considerable reputation, and in a large way of business. He bought stones principally in the rough, and of these he was a most excellent judge. His fancy was for stones of somewhat unusual size and value, and it was well known to be his custom, when he had accumulated a sufficient stock, to carry them himself to Amsterdam and supervise the cutting of the rough stones. Of this Hickler was aware, and he had no doubt that Brodski was now starting on one of his periodical excursions; that somewhere in the recesses of his rather shabby clothing was concealed a paper packet possibly worth several thousand pounds.

Brodski sat by the table munching monotonously and talking little. Hickler sat opposite him, talking nervously and rather wildly at times, and watching his guest with a growing fascination. Precious stones, and especially diamonds, were Hickler’s specialty. “Hard stuff”—silver plate—he avoided entirely; gold, excepting in the form of specie, he seldom touched; but stones, of which he could carry off a whole consignment in the heel of his boot and dispose of with absolute safety, formed the staple of his industry. And here was a man sitting opposite him with a parcel in his pocket containing the equivalent of a dozen of his most successful “scoops;” stones worth perhaps—? Here he pulled himself up short and began to talk rapidly, though without much coherence. For, even as he talked, other Words, formed subconsciously, seemed to insinuate themselves into the interstices of the sentences, and to carry on a parallel train of thought.

“Gets chilly in the evenings now, doesn’t it?” said Hickler.

“It does indeed,” Brodski agreed, and then resumed his slow munching, breathing audibly through his nose.

“Five thousand at least,” the subconscious train of thought resumed; “probably six or seven, perhaps ten.” Silas fidgeted in his chair and endeavoured to concentrate his ideas on some topic of interest. He was growing disagreeably conscious of a new and unfamiliar state of mind.

“Do you take any interest in gardening?”, he asked. Next to diamonds and weekly “property,” his besetting weakness was fuchsias.

Brodski chuckled sourly. “Hatton Garden is the nearest approach—?” He broke off suddenly, and then added, “I am a
Londoner, you know."

The abrupt break in the sentence was not unnoticed by Silas, nor had he any difficulty in interpreting it. A man who carries untold wealth upon his person must needs be wary in his speech.

"Yes," he answered absently, "it's hardly a Londoner's hobby." And then, half consciously, he began a rapid calculation. Put it at five thousand pounds. What would that represent in weekly property? His last set of houses had cost two hundred and fifty pounds apiece, and he had let them at ten shillings and sixpence a week. At that rate, five thousand pounds represented twenty houses at ten and sixpence a week—say ten pounds a week—one pound eight shillings a day—five hundred and twenty pounds a year—for life. It was a competency. Added to what he already had, it was wealth. With that income he could fling the tools of his trade into the river and live out the remainder of his life in comfort and security.

He glanced furtively at his guest across the table, and then looked away quickly as he felt stirring within him an impulse the nature of which he could not mistake. This must be put an end to. Crimes against the person he had always looked upon as sheer insanity. There was, it is true, that little affair of the Weybridge policeman, but that was unforeseen and unavoidable, and it was the constable's doing after all. And there was the old housekeeper at Epsom, too, but, of course, if the old idiot would shriek in that insane fashion—well, it was an accident, very regrettable, to be sure, and no one could be more sorry for the mishap than himself. But deliberate homicide!—robbery from the person! It was the act of a stark lunatic.

Of course, if he had happened to be that sort of person, here was the opportunity of a lifetime. The immense booty, the empty house, the solitary neighbourhood, away from the main road and from other habitations; the time, the darkness—but, of course, there was the body to be thought of; that was always the difficulty. What to do with the body? Here he caught the shriek of the up express, rounding the curve in the line that ran past the waste land at the back of the house. The sound started a new train of thought, and, as he followed it out, his eyes fixed themselves on the unconscious and taciturn Brodski, as he sat thoughtfully sipping his whisky. At length, averting his gaze with an effort, he rose suddenly from his chair and turned to look at the clock on the mantelpiece, spreading out his hands before the dying fire. A tumult of strange sensations warned him to leave the house. He shivered slightly, though he was rather hot than chilly, and, turning his head, looked at the door.

"Seems to be a confounded draught," he said, with another slight shiver; "did I shut the door properly, I wonder?" He strode across the room and, opening the door wide, looked out into the dark garden. A desire, sudden and urgent, had come over him to get out into the open air, to be on the road and have done with this madness that was knocking at the door of his brain.

"I wonder if it is worth while to start yet," he said, with a yearning glance at the murky, starless sky.

Brodski roused himself and looked round. "Is your clock right?" he asked.

Silas reluctantly admitted that it was.

"How long will it take us to walk to the station?" inquired Brodski.

"Oh, about twenty-five minutes to half-an-hour," replied Silas, unconsciously exaggerating the distance.

"Well," said Brodski, "we've got more than an hour yet, and it's more comfortable here than hanging about the station. I don't see the use of starting before we need."

"No; of course not," Silas agreed. A wave of strange emotion, half-regretful, half-triumphant, surged through his brain. For some moments he remained standing on the threshold, looking out dreamily into the night. Then he softly closed the door; and, seemingly without the exercise of his volition, the key turned noiselessly in the lock.

He returned to his chair and tried to open a conversation with the taciturn Brodski, but the words came faltering and disjointed. He felt his face growing hot, his brain full and intense, and there was a faint, high-pitched singing in his ears. He was conscious of watching his guest with a new and fearful interest, and, by sheer force of will, turned away his eyes; only to find them a moment later involuntarily returning to fix the unconscious man with yet more horrible intensity. And ever through his mind walked, like a dreadful procession, the thoughts of what that other man—the man of blood and violence—would do in these circumstances. Detail by detail the hideous synthesis fitted together the parts of the imagined crime, and arranged them in due sequence until they formed a succession of events, rational, connected and coherent.

He rose uneasily from his chair, with his eyes still riveted upon his guest. He could not sit any longer opposite that man with his hidden store of precious gems. The impulse that he recognized with fear and wonder was growing more unovercomable from moment to moment. If he stayed it would presently overpower him, and then? He shrank with horror from the dreadful thought, but his fingers itched to handle the diamonds. For Silas was, after all, a criminal by nature and habit. He was a beast of prey. His livelihood had never been earned; it had been taken by stealth or, if necessary, by force. His instincts were predacious, and the proximity of unguarded valuables suggested to him, as a logical consequence, their abstraction or seizure. His unwillingness to let these diamonds go away beyond his reach was fast becoming overwhelming.

But he would make one more effort to escape. He would keep out of Brodski's actual presence until the moment for starting came.

"If you'll excuse me," he said, "I will go and put on a thicker pair of boots. After all this dry weather we may get a change, and damp feet are very uncomfortable when you are travelling."
“Yes; dangerous too,” agreed Brodski.

Silas walked through into the adjoining kitchen, where, by the light of the little lamp that was burning there, he had seen his stout, country boots placed, cleaned and in readiness, and sat down upon a chair to make the change. He did not, of course, intend to wear the country boots, for the diamonds were concealed in those he had on. But he would make the change and then alter his mind; it would all help to pass the time. He took a deep breath. It was a relief, at any rate, to be out of that room. Perhaps if he stayed away, the temptation would pass. Brodski would go on his way—he wished that he was going alone—and the danger would be over—at least—and the opportunity would have gone—the diamonds—?

He looked up as he slowly unlaced his boot. From where he sat he could see Brodski sitting by the table with his back towards the kitchen door. He had finished eating, now, and was composedly rolling a cigarette. Silas breathed heavily, and, slipping off his boot, sat for a while motionless, gazing steadily at the other man’s back. Then he unlaced the other boot, still staring abstractedly at his unconscious guest, drew it off, and laid it very quietly on the floor.

Brodski calmly finished rolling his cigarette, licked the paper, put away his pouch, and, having dusted the crumbs of tobacco from his knees, began to search his pockets for a match. Suddenly, yielding to an uncontrollable impulse, Silas stood up and began stealthily to creep along the passage to the sitting-room. Not a sound came from his stockinged feet. Silently as a cat he stole forward, breathing softly with parted lips, until he stood at the threshold of the room. His face flushed dully, his eyes, wide and staring, glittered in the lamplight, and the racing blood hummed in his ears.

Brodski struck a match—Silas noted that it was a wooden vesta—lighted his cigarette, blew out the match and flung it into the fender. Then he replaced the box in his pocket and commenced to smoke.

Slowly and without a sound Silas crept forward into the room, step by step, with catlike stealthiness, until he stood close behind Brodski’s chair—so close that he had to turn his head that his breath might not stir the hair upon the other man’s head. So, for half-a-minute, he stood motionless, like a symbo]l[ical statue of Murder, glaring down with horrible, glittering eyes upon the unconscious diamond merchant, while his quick breath passed without a sound through his open mouth and his fingers writhed slowly like the tentacles of a giant hydra. And then, as noiselessly as ever, he backed away to the door, turned quickly and walked back into the kitchen.

He drew a deep breath. It had been a near thing. Brodski’s life had hung upon a thread. For it had been so easy. Indeed, if he had happened, as he stood behind the man’s chair, to have a weapon—a hammer, for instance, or even a stone?

He glanced round the kitchen and his eyes lighted on a bar that had been left by the workmen who had put up the new greenhouse. It was an odd piece cut off from a square, wrought-iron stanchion, and was about a foot long and perhaps three-quarters of an inch thick. Now, if he had had that in his hand a minute ago—

He picked the bar up, balanced it in his hand and swung it round his head. A formidable weapon this: silent, too. And it fitted the plan that had passed through his brain. Bah! He had better put the thing down.

But he did not. He stepped over to the door and looked again at Brodski, sitting, as before, meditatively smoking, with his back towards the kitchen.

Suddenly a change came over Silas. His face flushed, the veins of his neck stood out and a sullen scowl settled on his face. He drew out his watch, glanced at it earnestly and replaced it. Then he strode swiftly but silently along the passage into the sitting-room.

A pace away from his victim’s chair he halted and took deliberate aim. The bar swung aloft, but not without some faint rustle of movement, for Brodski looked round quickly even as the iron whistled through the air. The movement disturbed the murderer’s aim, and the bar glanced off his victim’s head, making only a trifling wound. Brodski sprang up with a tremulous, bleating cry, and clutched his assailant’s arms with the tenacity of mortal terror.

Then began a terrible struggle, as the two men, locked in a deadly embrace, swayed to and fro and trampled backwards and forwards. The chair was overturned, an empty glass swept from the table and, with Brodski’s spectacles, crushed beneath stamping feet. And thrice that dreadful, pitiful, bleating cry rang out into the night, filling Silas, despite his murderous frenzy, with terror lest some chance wayfarer should hear it. Gathering his great strength for a final effort, he forced his victim backwards onto the table and, snatching up a corner of the tablecloth, thrust it into his face and crammed it into his mouth as it opened to utter another shriek. And thus they remained for a full two minutes, almost motionless, like some dreadful group of tragic allegory. Then, when the last faint twitchings had died away, Silas relaxed his grasp and let the limp body slip softly onto the floor.

It was over. For good or for evil, the thing was done. Silas stood up, breathing heavily, and, as he wiped the sweat from his face, he looked at the clock. The hands stood at one minute to seven. The whole thing had taken a little over three minutes. He had nearly an hour in which to finish his task. The goods train that entered into his scheme came by at twenty minutes past, and it was only three hundred yards to the line. Still, he must not waste time. He was now quite composed, and only disturbed by the thought that Brodski’s cries might have been heard. If no one had heard them it was all plain sailing.

He stooped, and, gently disengaging the table-cloth from the dead man’s teeth, began a careful search of his pockets. He was not long finding what he sought, and, as he pinched the paper packet and felt the little hard bodies grating on one another inside, his faint regrets for what had happened were swallowed up in self-congratulations.

He now set about his task with business-like briskness and an attentive eye on the clock. A few large drops of blood had
fallen on the table-cloth, and there was a small bloody smear on the carpet by the dead man's head. Silas fetched from the kitchen some water, a nail-brush and a dry cloth, and, having washed out the stains from the table-cover—not forgetting the deal table-top underneath—and cleaned away the smear from the carpet and rubbed the damp places dry, he slipped a sheet of paper under the head of the corpse to prevent further contamination. Then he set the tablecloth straight, stood the chair upright, laid the broken spectacles on the table and picked up the cigarette, which had been trodden flat in the struggle, and flung it under the grate. Then there was the broken glass, which he swept up into a dust-pan. Part of it was the remains of the shattered tumbler, and the rest the fragments of the broken spectacles. He turned it out onto a sheet of paper and looked it over carefully, picking out the larger recognizable pieces of the spectacle-glasses and putting them aside on a separate slip of paper, together with a sprinkling of the minute fragments. The remainder he shot back into the dust-pan and, having hurriedly put on his boots, carried it out to the rubbish-heap at the back of the house.

It was now time to start. Hastily cutting off a length of string from his string-box—for Silas was an orderly man and despised the oddments of string with which many people make shift—he tied it to the dead man's bag and umbrella and slung them from his shoulder. Then he folded up the paper of broken glass, and, slipping it and the spectacles into his pocket, picked up the body and threw it over his shoulder. Brodski was a small, spare man, weighing not more than nine stone; not a very formidable burden for a big, athletic man like Silas.

The night was intensely dark, and, when Silas looked out of the back gate over the waste land that stretched from his house to the railway, he could hardly see twenty yards ahead. After listening cautiously and hearing no sound, he went out, shut the gate softly behind him and set forth at a good pace, though carefully, over the broken ground. His progress was not as silent as he could have wished for, though.

The scanty turf that covered the gravelly land was thick enough to deaden his footfalls, the swinging bag and umbrella made an irritating noise; indeed, his movements were more hampered by them than by the weightier burden.

The distance to the line was about three hundred yards. Ordinarily he would have walked it in from three to four minutes, but now, going cautiously with his burden and stopping now and again to listen, it took him just six minutes to reach the three-bar fence that separated the waste land from the railway. Arrived here he halted for a moment and once more listened attentively, peering into the darkness on all sides. Not a living creature was to be seen or heard in this desolate spot, but far away, the shriek of an engine's whistle warned him to hasten.

Lifting the corpse easily over the fence, he carried it a few yards farther to a point where the line curved sharply.

Here he laid it face downwards, with the neck over the near rail. Drawing out his pocket-knife, he cut through the knot that fastened the umbrella to the string and also secured the bag; and when he had flung the bag and umbrella on the track beside the body, he carefully pocketed the string, excepting the little loop that had fallen to the ground when the knot was cut.

The quick snort and clanking rumble of an approaching goods train began now to be clearly audible. Rapidly, Silas; drew from his pockets the battered spectacles and the packet of broken glass. The former he threw down by the dead man's head, and then, emptying the packet into his hand, sprinkled the fragments of glass around the spectacles.

He was none too soon. Already the quick, laboured puffing of the engine sounded close at hand. His impulse was to stay and watch; to witness the final catastrophe that should convert the murder into an accident or suicide. But it was hardly safe: it would be better that he should not be near lest he should not be able to get away without being seen. Hastily he climbed back over the fence and strode away across the rough fields, while the train came snorting and clattering towards the curve.

He had nearly reached his back gate when a sound from the line brought him to a sudden halt; it was a prolonged whistle accompanied by the groan of brakes and the loud clank of colliding trucks. The snorting of the engine had ceased and was replaced by the penetrating hiss of escaping steam.

The train had stopped!

For one brief moment Silas stood with bated breath and mouth agape like one petrified; then he strode forward quickly to the gate, and, letting himself in, silently slid the bolt. He was undeniably alarmed. What could have happened on the line? It was practically certain that the body had been seen; but what was happening now? and would they come to the house? He entered the kitchen, and having paused again to listen—for somebody might come and knock at the door at any moment—he walked through the sitting-room and looked round. All seemed in order there. There was the bar, though, lying where he had dropped it in the scuffle. He picked it up and held it under the lamp. There was no blood on it; only one or two hairs. Somewhat absent he wiped it with the table-cover, and then, running out through the kitchen into the back garden, dropped it over the wall into a bed of nettles. Not that there was anything incriminating in the bar, but, since he had used it as a weapon, it had somehow acquired a sinister aspect to his eye.

He now felt that it would be well to start for the station at once. It was not time yet, for it was barely twenty-five minutes past seven; but he did not wish to be found in the house if any one should come. His soft hat was on the sofa with his bag, to which his umbrella was strapped. He put on the hat, caught up the bag and stepped over to the door; then he came back to turn down the lamp. And it was at this moment, when he stood with his hand raised to the burner, that his eyes, travelling by chance into the dim corner of the room, lighted on Brodski's grey felt hat, reposing on the chair where the dead man had placed it when he entered the house.
Silas stood for a few moments as if petrified, with the chilly sweat of mortal fear standing in beads upon his forehead. Another instant and he would have turned the lamp down and gone on his way; and then—? He strode over to the chair, snatched up the hat and looked inside it. Yes, there was the name, “Oscar Brodski,” written plainly on the lining. If he had gone away, leaving it to be discovered, he would have been lost; indeed, even now, if a search-party should come to the house, it was enough to send him to the gallows.

His limbs shook with horror at the thought, but in spite of his panic he did not lose his self-possession. Darting through into the kitchen, he grabbed up a handful of the dry brush-wood that was kept for lighting fires and carried it to the sitting-room grate where he thrust it on the extinct, but still hot, embers, and crumpling up the paper that he had placed under Brodski’s head—on which paper he now noticed, for the first time, a minute bloody smear—he poked it in under the wood, and striking a wax match, set light to it. As the wood flared up, he hacked at the hat with his pocket knife and threw the ragged strips into the blaze.

And all the while his heart was thumping and his hands a-tremble with the dread of discovery. The fragments of felt were far from inflammable, tending rather to fuse into cindery masses that smoked and smouldered than to burn away into actual ash. Moreover, to his dismay, they emitted a powerful resinous stench mixed with the odour of burning hair, so that he had to open the kitchen window (since he dared not unlock the front door) to disperse the reek. And still, as he fed the fire with small cut fragments, he strained his ears to catch, above the crackling of the wood, the sound of the dreaded footsteps, the knock on the door that should be as the summons of Fate.

The time, too, was speeding on. Twenty-one minutes to eight! In a few minutes more he must set out or he would miss the train. He dropped the dismembered hat-brim on the blazing wood and ran upstairs to open a window, since he must close that in the kitchen before he left. When he came back, the brim had already curled up into a black, clinkery mass that bubbled and hissed as the fat, pungent smoke rose from it sluggishly to the chimney.

Nineteen minutes to eight! It was time to start. He took up the poker and carefully beat the cinders into small particles, stirring them into the glowing embers of the wood and coal. There was nothing unusual in the appearance of the grate. It was his constant custom to burn letters and other discarded articles in the sitting-room fire: his housekeeper would notice nothing out of the common. Indeed, the cinders would probably be reduced to ashes before she returned. He had been careful to notice that there were no metallic fittings of any kind in the hat, which might have escaped burning.

Once more he picked up his bag, took a last look round, turned down the lamp and, unlocking the door, held it open for a few moments. Then he went out, locked the door, pocketed the key (of which his housekeeper had a duplicate) and set off at a brisk pace for the station.

He arrived in good time after all, and, having taken his ticket, strolled through onto the platform. The train was not yet signalled, but there seemed to be an unusual stir in the place. The passengers were collected in a group at one end of the platform, and were all looking in one direction down the line; and, even as he walked towards them, with a certain tremulous, nauseating curiosity, two men emerged from the darkness and ascended the slope to the platform, carrying a stretcher covered with a tarpaulin. The passengers parted to let the bearers pass, turning fascinated eyes upon the shape that showed faintly through the rough pall; and, when the stretcher had been borne into the lamp-room, they fixed their attention upon a porter who followed carrying a hand-bag and an umbrella.

Suddenly one of the passengers started forward with an exclamation.

“Is that his umbrella?” he demanded.

“Yes, sir,” answered the porter, stopping and holding it out for the speaker’s inspection.

“My God!” ejaculated the passenger; then, turning sharply to a tall man who stood close by, he said excitedly: “That’s Brodski’s umbrella. I could swear to it. You remember Brodski?” The tall man nodded, and the passenger, turning once more to the porter, said: “I identify that umbrella. It belongs to a gentleman named Brodski. If you look in his hat you will see his name written in it. He always writes his name in his hat.”

“We haven’t found his hat yet,” said the porter; “but here is the station-master coming up the line.” He awaited the arrival of his superior and then announced: “This gentleman, sir, has identified the umbrella.”

“Oh,” said the station-master, “you recognize the umbrella, sir, do you? Then perhaps you would step into the lamp-room and see if you can identify the body.”

“Is it—is he—very much injured?” the passenger asked tremulously.

“Well, yes,” was the reply. “You see, the engine and six of the trucks went over him before they could stop the train. Took his head clean off, in fact.”

“Shocking! shocking!” gasped the passenger. “I think, if you don’t mind—I’d—I’d rather not. You don’t think it’s necessary, doctor, do you?”

“Yes, I do,” replied the tall man. “Early identification may be of the first importance.”

“Then I suppose I must,” said the passenger.

Very reluctantly he allowed himself to be conducted by the station-master to the lamp-room, as the clang of the bell announced the approaching train. Silas Hickler followed and took his stand with the expectant crowd outside the closed
door. In a few moments the passenger burst out, pale and awe-stricken, and rushed up to his tall friend. “It is!” he exclaimed breathlessly. “It’s Brodski! Poor old Brodski! Horrible! horrible! He was to have met me here and come on with me to Amsterdam.”

“Had he any—merchandize about him?” the tall man asked; and Silas strained his ears to catch the reply.

“He had some stones, no doubt, but I don’t know what.

His clerk will know, of course. By the way, doctor, could you watch the case for me? Just to be sure it was really an accident or—you know what. We were old friends, you know, fellow townsman, too; we were both born in Warsaw. I’d like you to give an eye to the case.”

“Very well,” said the other. “I will satisfy myself that—there is nothing more than appears, and let you have a report. Will that do?”

“Thank you. It’s excessively good of you, doctor. Ah! here comes the train. I hope it won’t inconvenience you to stay and see to this matter.”

“Not in the least,” replied the doctor. “We are not due at Warmington until to-morrow afternoon, and I expect we can find out all that is necessary to know before that.”

Silas looked long and curiously at the tall, imposing man who was, as it were, taking his seat at the chessboard, to play against him for his life. A formidable antagonist he looked, with his keen, thoughtful face, so resolute and calm. As Silas stepped into his carriage he thought with deep discomfort of Brodski’s hat, and hoped that he had made no other oversight.

PART II. — THE MECHANISM OF DETECTION
(RELATED BY CHRISTOPHER JERVIS, M.D.)

THE singular circumstances that attended the death of Mr. Oscar Brodski, the well-known diamond merchant of Hatton Garden, illustrated very forcibly the importance of one or two points in medico-legal practice which Thorndyke was accustomed to insist were not sufficiently appreciated. What those points were, I shall leave my friend and teacher to state at the proper place; and meanwhile, as the case is in the highest degree instructive, I shall record the incidents in the order of their occurrence.

The dusk of an October evening was closing in as Thorndyke and I, the sole occupants of a smoking compartment, found ourselves approaching the little station of Ludham; and, as the train slowed down, we peered out at the knot of country, people who were waiting on the platform. Suddenly Thorndyke exclaimed in a tone of surprise: “Why, that is surely Boscovitch!” and almost at the same moment a brisk, excitable little man darted at the door of our compartment and literally tumbled in.

“I hope I don’t intrude on this learned conclave,” he said, shaking hands genially and banging his Gladstone with impulsive violence into the rack; “but I saw your faces at the window, and naturally jumped at the chance of such pleasant companionship.”

“You are very flattering,” said Thorndyke; “so flattering that you leave us nothing to say. But what in the name of fortune are you doing at—what’s the name of the place—Ludham?”

“My brother has a little place a mile or so from here, and I have been spending a couple of days with him,” Mr. Boscovitch explained. “I shall change at Badsham Junction and catch the boat train for Amsterdam. But whither are you two bound? I see you have your mysterious little green box up on the hat-rack, so I infer that you are on some romantic quest, eh? Going to unravel some dark and intricate crime?”

“No,” replied Thorndyke. “We are bound for Warmington on a quite prosaic errand. I am instructed to watch the proceedings at an inquest there to-morrow on behalf of the Griffin Life Insurance Office, and we are travelling down tonight as it is rather a cross-country journey.”

“But why the box of magic?” asked Boscovitch, glancing up at the hat-rack.

“I never go away from home without it,” answered Thorndyke. “One never knows what may turn up; the trouble of carrying it is small when set off against the comfort of having appliances at hand in an emergency.”

Boscovitch continued to stare up at the little square case covered with Willesden canvas. Presently he remarked: “I often used to wonder what you had in it when you were down at Chelmsford in connection with that bank murder—what an amazing case that was, by the way, and didn’t your methods of research astonish the police!” As he still looked up wistfully at the case, Thorndyke good-naturedly lifted it down and unlocked it. As a matter of fact he was rather proud of his “portable laboratory,” and certainly it was a triumph of condensation, for, small as it was—only a foot square by four inches deep—it contained a fairly complete outfit for a preliminary investigation.

“Wonderful!” exclaimed Boscovitch, when the case lay open before him, displaying its rows of little re-agent bottles, tiny test-tubes, diminutive spirit-lamp, dwarf microscope and assorted instruments on the same Lilliputian scale; “it’s like a doll’s house—everything looks as if it was seen through the wrong end of a telescope. But are these tiny things really efficient? That microscope now—?”
“Perfectly efficient at low and moderate magnifications,” said Thorndyke. “It looks like a toy, but it isn’t one; the lenses are the best that can be had. Of course a full-sized instrument would be infinitely more convenient—but I shouldn’t have it with me, and should have to make shift with a pocket-lens. And so with the rest of the under-sized appliances; they are the alternative to no appliances.”

Boscovitch pored over the case and its contents, fingerling the instruments delicately and asking questions innumerable about their uses; indeed, his curiosity was but half appeased when, half-an-hour later, the train began to slow down.

“By Jove!” he exclaimed, starting up and seizing his bag, “here we are at the junction already. You change here too, don’t you?”

“Yes,” replied Thorndyke. “We take the branch train on to Warnington.”

As we stepped out onto the platform, we became aware that something unusual was happening or had happened. All the passengers and most of the porters and supernumeraries were gathered at one end of the station, and all were looking intently into the darkness down the line.

“Anything wrong?” asked Mr. Boscovitch, addressing the station-inspector.

“Yes, sir,” the official replied; “a man has been run over by the goods train about a mile down the line. The station-master has gone down with a stretcher to bring him in, and I expect that is his lantern that you see coming this way.”

As we stood watching the dancing light grow momentarily brighter, flashing fitful reflections from the burnished rails, a man came out of the booking-office and joined the group of onlookers. He attracted my attention, as I afterwards remembered, for two reasons: in the first place his round, jolly face was excessively pale and bore a strained and wild expression, and, in the second, though he stared into the darkness with eager curiosity he asked no questions.

The swinging lantern continued to approach, and then suddenly two men came into sight bearing a stretcher covered with a tarpaulin, through which the shape of a human figure was dimly discernible. They ascended the slope to the platform, and proceeded with their burden to the lamp-room, when the inquisitive gaze of the passengers was transferred to a porter who followed carrying a handbag and umbrella and to the station-master who brought up the rear with his lantern.

As the porter passed, Mr. Boscovitch started forward with sudden excitement.

“Is that his umbrella?” he asked.

“Yes, sir,” answered the porter, stopping and holding it out for the speaker’s inspection.

“My God!” ejaculated Boscovitch; then, turning sharply to Thorndyke, he exclaimed: “That’s Brodski’s umbrella. I could swear to it. You remember Brodski?”

Thorndyke nodded, and Boscovitch, turning once more to the porter, said: “I identify that umbrella. It belongs to a gentleman named Brodski. If you look in his hat, you will see his name written in it. He always writes his name in his hat.”

“We haven’t found his hat yet,” said the porter; “but here is the station-master.” He turned to his superior and announced: “This gentleman, sir, has identified the umbrella.”

“Oh,” said the station-master, “you recognize the umbrella, sir, do you? Then perhaps you would step into the lamp-room and see if you can identify the body.”

Mr. Boscovitch recoiled with a look of alarm. “Is it? is he—very much injured?” he asked nervously.

“Well, yes,” was the reply. “You see, the engine and six of the trucks went over him before they could stop the train. Took his head clean off, in fact.”

“Yes, I do,” replied Thorndyke. “Early identification may be of the first importance.”

“Then I suppose I must,” said Boscovitch; and, with extreme reluctance, he followed the station-master to the lamp-room, as the loud ringing of the bell announced the approach of the boat train. His inspection must have been of the briefest, for, in a few moments, he burst out, pale and awe-stricken, and rushed up to Thorndyke.

“It is!” he exclaimed breathlessly. “It’s Brodski! Poor old Brodski! Horrible! horrible! He was to have met me here and come on with me to Amsterdam.”

“Had he any—merchandise about him?” Thorndyke asked; and, as he spoke, the stranger whom I had previously noticed edged up closer as if to catch the reply.

“He had some stones, no doubt,” answered Boscovitch, “but I don’t know what they were. His clerk will know, of course. By the way, doctor, could you watch the case for me? Just to be sure it was really an accident or—you know what. We were old friends, you know, fellow townsmen, too; we were both born in Warsaw. I’d like you to give an eye to the case.”

“Very well,” said Thorndyke. “I will satisfy myself that there is nothing more than appears, and let you have a report. Will that do?”
“Thank you,” said Boscovitch. “It’s excessively good of you, doctor. Ah, here comes the train. I hope it won’t inconvenience you to stay and see to the matter.”

“Not in the least,” replied Thorndyke. “We are not due at Warmington until to-morrow afternoon, and I expect we can find out all that is necessary to know and still keep our appointment.”

As Thorndyke spoke, the stranger, who had kept close to us with the evident purpose of hearing what was said, bestowed on him a very curious and attentive look; and it was only when the train had actually come to rest by the platform that he hurried away to find a compartment.

No sooner had the train left the station than Thorndyke sought out the station-master and informed him of the instructions that he had received from Boscovitch. “Of course,” he added, in conclusion, “we must not move in the matter until the police arrive. I suppose they have been informed?”

“Yes,” replied the station-master; “I sent a message at once to the Chief Constable, and I expect him or an inspector at any moment. In fact, I think I will slip out to the approach and see if he is coming.” He evidently wished to have a word in private with the police officer before committing himself to any statement.

As the official departed, Thorndyke and I began to pace the now empty platform, and my friend, as was his wont, when entering on a new inquiry, meditatively reviewed the features of the problem.

“In a case of this kind,” he remarked, “we have to decide on one of three possible explanations: accident, suicide or homicide; and our decision will be determined by inferences from three sets of facts: first, the general facts of the case; second, the special data obtained by examination of the body, and, third, the special data obtained by examining the spot on which the body was found. Now the only general facts at present in our possession are that the deceased was a diamond merchant making a journey for a specific purpose and probably having on his person property of small bulk and great value. These facts are somewhat against the hypothesis of suicide and somewhat favourable to that of homicide. Facts relevant to the question of accident would be the existence or otherwise of a level crossing, a road or path leading to the line, an enclosing fence with or without a gate, and any other facts rendering probable or otherwise the accidental presence of the deceased at the spot where the body was found. As we do not possess these facts, it is desirable that we extend our knowledge.”

“Why not put a few discreet questions to the porter who brought in the bag and umbrella?” I suggested. “He is at this moment in earnest conversation with the ticket collector and would, no doubt, be glad of a new listener.”

An excellent suggestion, Jervis,” answered Thorndyke. “Let us see what he has to tell us.” We approached the porter and found him, as I had anticipated, bursting to unburden himself of the tragic story.

“The way the thing happened, sir, was this,” he said, in answer to Thorndyke’s question: “There’s a sharpish bend in the road just at that place, and the goods train was just rounding the curve when the driver suddenly caught sight of something lying across the rails. As the engine turned, the head-lights shone on it and then he saw it was a man. He shut off steam at once, blew his whistle, and put the brakes down hard, but, as you know, sir, a goods train takes some stopping; before they could bring her up, the engine and half-a-dozen trucks had gone over the poor beggar.”

“Could the driver see how the man was lying?” Thorndyke asked.

“Yes, he could see him quite plain, because the headlights were full on him. He was lying on his face with his neck over the near rail on the downside. His head was in the four-foot and his body by the side of the track. It looked as if he had laid himself out a-purpose.”

“Is there a level crossing thereabouts?” asked Thorndyke.

“No, sir. No crossing, no road, no path, no nothing,” said the porter, ruthlessly sacrificing grammar to emphasis. “He must have come across the fields and climbed over the fence to get onto the permanent way. Deliberate suicide is what it looks like.”

“How did you learn all this?” Thorndyke inquired.

“Why, the driver, you see, sir, when him and his mate had lifted the body off the track, went on to the next signal-box and sent in his report by telegram. The station-master told me all about it as we walked down the line.”

Thorndyke thanked the man for his information, and, as we strolled back towards the lamp-room, discussed the bearing of these new facts.

“Our friend is unquestionably right in one respect,” he said; “this was not an accident. The man might, if he were near-sighted, deaf or stupid, have climbed over the fence and got knocked down by the train. But his position, lying across the rails, can only be explained by one of two hypotheses: either it was, as the porter says, deliberate suicide, or else the man was already dead or insensible. We must leave it at that until we have seen the body, that is, if the police will allow us to see it. But here comes the station-master and an officer with him. Let us hear what they have to say.”

The two officials had evidently made up their minds to decline any outside assistance. The divisional surgeon would make the necessary examination, and information could be obtained through the usual channels. The production of Thorndyke’s card, however, somewhat altered the situation. The police inspector hummed and hawed irresolutely, with the card in his hand, but finally agreed to allow us to view the body, and we entered the lamp-room together, the station-
master leading the way to turn up the gas.

The stretcher stood on the floor by one wall, its grim burden still hidden by the tarpaulin, and the hand-bag and umbrella lay on a large box, together with the battered frame of a pair of spectacles from which the glasses had fallen out.

“Were these spectacles found by the body?” Thorndyke inquired.

“Yes,” replied the station-master. “They were close to the head and the glass was scattered about on the ballast.”

Thorndyke made a note in his pocket-book, and then, as the inspector removed the tarpaulin, he glanced down on the corpse, lying limp on the stretcher and looking grotesquely horrible with its displaced head and distorted limbs. For fully a minute he remained silently stooping over the uncanny object, on which the inspector was now throwing the light of a large lantern; then he stood up and said quietly to me: “I think we can eliminate two out of the three hypotheses.”

The inspector looked at him quickly, and was about to ask a question, when his attention was diverted by the travelling-case which Thorndyke had laid on a shelf and now opened to abstract a couple of pairs of dissecting forceps.

“We’ve no authority to make a post mortem, you know,” said the inspector.

“No, of course not,” said Thorndyke. “I am merely going to look into the mouth.” With one pair of forceps he turned back the lip and, having scrutinized its inner surface, closely examined the teeth.

“May I trouble you for your lens, Jervis?” he said; and, as I handed him my doublet ready opened, the inspector brought the lantern close to the dead face and leaned forward eagerly. In his usual systematic fashion, Thorndyke slowly passed the lens along the whole range of sharp, uneven teeth, and then, bringing it back to the centre, examined with more minuteness the upper incisors. At length, very delicately, he picked out with his forceps some minute object from between two of the upper front teeth and held it in the focus of the lens. Anticipating his next move, I took a labelled microscope-slide from the case and handed it to him together with a dissecting needle, and, as he transferred the object to the slide and spread it out with the needle, I set up the little microscope on the shelf.

“A drop of Farrant and a cover-glass, please, Jervis,” said Thorndyke.

I handed him the bottle, and, when he had let a drop of the mounting fluid fall gently on the object and put on the cover-slip, he placed the slide on the stage of the microscope and examined it attentively.

Happening to glance at the inspector, I observed on his countenance a faint grin, which he politely strove to suppress when he caught my eye.

“I was thinking, sir,” he said apologetically, “that it’s a bit off the track to be finding out what he had for dinner. He didn’t die of unwholesome feeding.”

Thorndyke looked up with a smile. “It doesn’t do, inspector, to assume that anything is off the track in an inquiry of this kind. Every fact must have some significance, you know.”

“I don’t see any significance in the diet of a man who has had his head cut off,” the inspector rejoined defiantly.

“Don’t you?” said Thorndyke. “Is there no interest attaching to the last meal of a man who has met a violent death? These crumbs, for instance, that are scattered over the dead man’s waistcoat. Can we learn nothing from them?”

“I don’t see what you can learn,” was the dogged rejoinder.

Thorndyke picked off the crumbs, one by one, with his forceps, and having deposited them on a slide, inspected them, first with the lens and then through the microscope.

“I learn,” said he, “that shortly before his death, the deceased partook of some kind of whole-meal biscuits, apparently composed partly of oatmeal.”

“I call that nothing,” said the inspector. “The question that we have got to settle is not what refreshments had the deceased been taking, but what was the cause of his death: did he commit suicide? was he killed by accident? or was there any foul play?”

“I beg your pardon,” said Thorndyke, “the questions that remain to be settled are, who killed the deceased and with what motive? The others are already answered as far as I am concerned.”

The inspector stared in sheer amazement not unmixed with incredulity.

“You haven’t been long coming to a conclusion, sir,” he said.

“No, it was a pretty obvious case of murder,” said Thorndyke. “As to the motive, the deceased was a diamond merchant and is believed to have had a quantity of stones about his person. I should suggest that you search the body.”

The inspector gave vent to an exclamation of disgust. “I see,” he said. “It was just a guess on your part. The dead man was a diamond merchant and had valuable property about him; therefore he was murdered.” He drew himself up, and, regarding Thorndyke with stern reproach, added: “But you must understand, sir, that this is a judicial inquiry, not a prize competition in a penny paper. And, as to searching the body, why, that is what I principally came for.” He ostentatiously turned his back on us and proceeded systematically to turn out the dead man’s pockets, laying the articles, as he removed them, on the box by the side of the hand-bag and umbrella.
While he was thus occupied, Thorndyke looked over the body generally, paying special attention to the soles of the boots, which, to the inspector's undissembled amusement, he very thoroughly examined with the lens.

"I should have thought, sir, that his feet were large enough to be seen with the naked eye," was his comment; "but perhaps," he added, with a sly glance at the station-master, "you're a little near-sighted."

Thorndyke chuckled good-humouredly, and, while the officer continued his search, he looked over the articles that had already been laid on the box. The purse and pocket-book he naturally left for the inspector to open, but the reading-glasses, pocket-knife and card-case and other small pocket articles were subjected to a searching scrutiny. The inspector watched him out of the corner of his eye with sly amusement; saw him hold up the glasses to the light to estimate their refractive power, peer into the tobacco pouch, open the cigarette book and examine the watermark of the paper, and even inspect the contents of the silver match-box.

"What might you have expected to find in his tobacco pouch?" the officer asked, laying down a bunch of keys from the dead man's pocket.

"Tobacco," Thorndyke replied stolidly; "but I did not expect to find fine-cut Latakia. I don't remember ever having seen pure Latakia smoked in cigarettes."

"You do take an interest in things, sir," said the inspector, with a side glance at the stolid station-master.

"I do," Thorndyke agreed; "and I note that there are no diamonds among this collection."

"No, and we don't know that he had any about him; but there's a gold watch and chain, a diamond scarf-pin, and a purse containing"—he opened it and tipped out its contents into his hand—"twelve pounds in gold. That doesn't look much like robbery, does it? What do you say to the murder theory now?"

"My opinion is unchanged," said Thorndyke, "and I should like to examine the spot where the body was found. Has the engine been inspected?" he added, addressing the station-master.

"I telegraphed to Bradfield to have it examined," the official answered. "The report has probably come in by now. I'd better see before we start down the line."

We emerged from the lamp-room and, at the door, found the station-inspector waiting with a telegram. He handed it to the station-master, who read it aloud.

"The engine has been carefully examined by me. I find small smear of blood on near leading wheel and smaller one on next wheel following. No other marks." He glanced questioningly at Thorndyke, who nodded and remarked: "It will be interesting to see if the line tells the same tale."

The station-master looked puzzled and was apparently about to ask for an explanation; but the inspector, who had carefully pocketed the dead man's property, was impatient to start and, accordingly, when Thorndyke had repacked his case and had, at his own request, been furnished with a lantern, we set off down the permanent way, Thorndyke carrying the light and I the indispensable green case.

"I am a little in the dark about this affair," I said, when we had allowed the two officials to draw ahead out of earshot; "you came to a conclusion remarkably quickly. What was it that so immediately determined the opinion of murder as against suicide?"

"It was a small matter but very conclusive," replied Thorndyke. "You noticed a small scalp-wound above the left temple? It was a glancing wound, and might easily have been made by the engine. But the wound had bled; and it had bled for an appreciable time. There were two streams of blood from it, and in both the blood was firmly clotted and partially dried. But the man had been decapitated; and this wound, if inflicted by the engine, must have been made after the decapitation, since it was on the side most distant from the engine as it approached. Now, a decapitated head does not bleed. Therefore, this wound was inflicted before the decapitation.

"But not only had the wound bled: the blood had trickled down in two streams at right angles to one another. First, in the order of time as shown by the appearance of the stream, it had trickled down the side of the face and dropped on the collar. The second stream ran from the wound to the back of the head. Now, you know, Jervis, there are no exceptions to the law of gravity. If the blood ran down the face towards the chin, the face must have been upright at the time; and if the blood trickled from the front to the back of the head, the head must have been horizontal and face upwards. But the man when he was seen by the engine-driver, was lying face downwards. The only possible inference is that when the wound was inflicted, the man was in the upright position—standing or sitting; and that subsequently, and while he was still alive, he lay on his back for a sufficiently long time for the blood to have trickled to the back of his head."

"I see. I was a duffer not to have reasoned this out for myself," I remarked contritely.

"Quick observation and rapid inference come by practice," replied Thorndyke. "What did you notice about the face?"

"I thought there was a strong suggestion of asphyxia."

"Undoubtedly," said Thorndyke. "It was the face of a suffocated man. You must have noticed, too, that the tongue was very distinctly swollen and that on the inside of the upper lip were deep indentations made by the teeth, as well as one or two slight wounds, obviously caused by heavy pressure on the mouth. And now observe how completely these facts and inferences agree with those from the scalp wound. If we knew that the deceased had received a blow on the head, had
struggled with his assailant and been finally borne down and suffocated, we should look for precisely those signs which we have found."

"By the way, what was it that you found wedged between the teeth? I did not get a chance to look through the microscope."

"Ah!" said Thorndyke, "there we not only get confirmation, but we carry our inferences a stage further. The object was a little tuft of some textile fabric. Under the microscope I found it to consist of several different fibres, differently dyed. The bulk of it consisted of wool fibres dyed crimson, but there were also cotton fibres dyed blue and a few which looked like jute, dyed yellow. It was obviously a parti-coloured fabric and might have been part of a woman’s dress, though the presence of the jute is much more suggestive of a curtain or rug of inferior quality."

"And its importance?"

"Is that, if it is not part of an article of clothing, then it must have come from an article of furniture, and furniture suggests a habitation."

"That doesn’t seem very conclusive," I objected.

"It is not; but it is valuable corroboration."

"Of what?"

"Of the suggestion offered by the soles of the dead man’s boots. I examined them most minutely and could find no trace of sand, gravel or earth, in spite of the fact that he must have crossed fields and rough land to reach the place where he was found. What I did find was fine tobacco ash, a charred mark as if a cigar or cigarette had been trodden on, several crumbs of biscuit, and, on a projecting brad, some coloured fibres, apparently from a carpet. The manifest suggestion is that the man was killed in a house with a carpeted floor, and carried from thence to the railway."

I was silent for some moments. Well as I knew Thorndyke, I was completely taken by surprise; a sensation, indeed, that I experienced anew every time that I accompanied him on one of his investigations. His marvellous power of co-ordinating apparently insignificant facts, of arranging them into an ordered sequence and making them tell a coherent story, was a phenomenon that I never got used to; every exhibition of it astonished me afresh.

"If your inferences are correct," I said, "the problem is practically solved. There must be abundant traces inside the house. The only question is, which house is it?"

"Quite so," replied Thorndyke; "that is the question, and a very difficult question it is. A glance at that interior would doubtless clear up the whole mystery. But how are we to get that glance? We cannot enter houses speculatively to see if they present traces of a murder. At present, our clue breaks off abruptly. The other end of it is in some unknown house, and, if we cannot join up the two ends, our problem remains unsolved. For the question is, you remember, Who killed Oscar Brodski?"

"Then what do you propose to do?" I asked.

"The next stage of the inquiry is to connect some particular house with this crime. To that end, I can only gather up all available facts and consider each in all its possible bearings. If I cannot establish any such connection, then the inquiry will have failed and we shall have to make a fresh start—say, at Amsterdam, if it turns out that Brodski really had diamonds on his person, as I have no doubt he had."

Here our conversation was interrupted by our arrival at the spot where the body had been found. The station-master had halted, and he and the inspector were now examining the near rail by the light of their lanterns.

"There’s remarkably little blood about," said the former. "I’ve seen a good many accidents of this kind and there has always been a lot of blood, both on the engine and on the road. It’s very curious."

Thorndyke glanced at the rail with but slight attention: that question had ceased to interest him. But the light of his lantern flashed onto the ground at the side of the track—a loose, gravelly soil mixed with fragments of chalk—and from thence to the soles of the inspector’s boots, which were displayed as he knelt by the rail.

"You observe, Jervis?" he said in a low voice, and I nodded. The inspector’s boot-soles were covered with adherent particles of gravel and conspicuously marked by the chalk on which he had trodden.

"You haven’t found the hat, I suppose?" Thorndyke asked, stooping to pick up a short piece of string that lay on the ground at the side of the track.

"No," replied the inspector, "but it can’t be far off. You seem to have found another clue, sir," he added, with a grin, glancing at the piece of string.

"Who knows," said Thorndyke. "A short end of white twine with a green strand in it. It may tell us something later. At any rate we’ll keep it," and, taking from his pocket a small tin box containing, among other things, a number of seed envelopes, he slipped the string into one of the latter and scribbled a note in pencil on the outside. The inspector watched his proceedings with an indulgent smile, and then returned to his examination of the track, in which Thorndyke now joined.

"I suppose the poor chap was near-sighted," the officer remarked, indicating the remains of the shattered spectacles;
“that might account for his having strayed onto the line.”

“Possibly,” said Thorndyke. He had already noticed the fragments scattered over a sleeper and the adjacent ballast, and now once more produced his “collecting-box,” from which he took another seed envelope. “Would you hand me a pair of forceps, Jervis,” he said; “and perhaps you wouldn’t mind taking a pair yourself and helping me to gather up these fragments.”

As I complied, the inspector looked up curiously.

“There isn’t any doubt that these spectacles belonged to the deceased, is there?” he asked. “He certainly wore spectacles, for I saw the mark on his nose.”

“Still, there is no harm in verifying the fact,” said Thorndyke, and he added to me in a lower tone, “Pick up every particle you can find, Jervis. It may be most important.”

“I don’t quite see how,” I said, groping amongst the shingle by the light of the lantern in search of the tiny splinters of glass.

“Don’t you?” returned Thorndyke. “Well, look at these fragments; some of them are a fair size, but many of these on the sleeper are mere grains. And consider their number. Obviously, the condition of the glass does not agree with the circumstances in which we find it. These are thick concave spectacle-lenses broken into a great number of minute fragments. Now how were they broken? Not merely by falling, evidently: such a lens, when it is dropped, breaks into a small number of large pieces. Nor were they broken by the wheel passing over them, for they would then have been reduced to fine powder, and that powder would have been visible on the rail, which it is not. The spectacle-frames, you may remember, presented the same incongruity: they were battered and damaged more than they would have been by falling, but not nearly so much as they would have been if the wheel had passed over them.”

“What do you suggest, then?” I asked.

“The appearances suggest that the spectacles had been trodden on. But, if the body was carried here the probability is that the spectacles were carried here too, and that they were then already broken; for it is more likely that they were trodden on during the struggle than that the murderer trod on them after bringing them here. Hence the importance of picking up every fragment.”

“But why?” I inquired, rather foolishly, I must admit.

“Because, if, when we have picked up every fragment that we can find, there still remains missing a larger portion of the lenses than we could reasonably expect, that would tend to support our hypothesis and we might find the missing remainder elsewhere. If, on the other hand, we find as much of the lenses as we could expect to find, we must conclude that they were broken on this spot.”

While we were conducting our search, the two officials were circling around with their lanterns in quest of the missing hat; and, when we had at length picked up the last fragment, and a careful search, even aided by a lens, failed to reveal any other, we could see their lanterns moving, like will-o’-the-wisps, some distance down the line.

“We may as well see what we have got before our friends come back,” said Thorndyke, glancing at the twinkling lights.

“Lay the case down on the grass by the fence; it will serve for a table.”

I did so, and Thorndyke, taking a letter from his pocket, opened it, spread it out flat on the case, securing it with a couple of heavy stones, although the night was quite calm. Then he tipped the contents of the seed envelope out on the paper, and carefully spreading out the pieces of glass, looked at them for some moments in silence. And, as he looked, there stole over his face a very curious expression; with sudden eagerness he began picking out the large fragments and laying them on two visiting-cards which he had taken from his card-case. Rapidly and with wonderful deftness he fitted the pieces together, and, as the reconstituted lenses began gradually to take shape on their cards I looked on with growing excitement, for something in my colleague’s manner told me that we were on the verge of a discovery.

At length the two ovals of glass lay on their respective cards, complete save for one or two small gaps; and the little heap that remained consisted of fragments so minute as to render further reconstruction impossible. Then Thorndyke leaned back and laughed softly.

“This is certainly an unlooked-for result,” said he.

“What is?” I asked.

“Don’t you see, my dear fellow? There’s too much glass. We have almost completely built up the broken lenses, and the fragments that are left over are considerably more than are required to fill up the gaps.”

I looked at the little heap of small fragments and saw at once that it was as he had said. There was a surplus of small pieces.

“This is very extraordinary,” I said. “What do you think can be the explanation?”

“The fragments will probably tell us,” he replied, “if we ask them intelligently.”

He lifted the paper and the two cards carefully onto the ground, and, opening the case, took out the little microscope, to which he fitted the lowest-power objective and eye-piece—having a combined magnification of only ten diameters. Then he
transferred the minute fragments of glass to a slide, and, having arranged the lantern as a microscope-lamp, commenced his examination.

“Ha!” he exclaimed presently. “The plot thickens. There is too much glass and yet too little; that is to say, there are only one or two fragments here that belong to the spectacles; not nearly enough to complete the building up of the lenses. The remainder consists of a soft, uneven, moulded glass, easily distinguished from the clear, hard optical glass. These foreign fragments are all curved, as if they had formed part of a cylinder, and are, I should say, portions of a wine-glass or tumbler.” He moved the slide once or twice, and then continued: “We are in luck, Jervis. Here is a fragment with two little diverging lines etched on it, evidently the points of an eight-rayed star—and here is another with three points—the ends of three rays. This enables us to reconstruct the vessel perfectly. It was a clear, thin glass—probably a tumbler—decorated with scattered stars; I dare say you know the pattern. Sometimes there is an ornamented band in addition, but generally the stars form the only decoration. Have a look at the specimen.”

I had just applied my eye to the microscope when the station-master and the inspector came up. Our appearance, seated on the ground with the microscope between us, was too much for the police officer’s gravity, and he laughed long and joyously.

“You must excuse me, gentlemen,” he said apologetically, “but really, you know, to an old hand, like myself, it does look a little—well—you understand—I dare say a microscope is a very interesting and amusing thing, but it doesn’t get you much forwarder in a case like this, does it?”

“Perhaps not,” replied Thorndyke. “By the way, where did you find the hat, after all?”

“We haven’t found it,” the inspector replied.

“Then we must help you to continue the search,” said Thorndyke. “If you will wait a few moments, we will come with you.” He poured a few drops of xylol balsam on the cards to fix the reconstituted lenses to their supports and then, packing them and the microscope in the case, announced that he was ready to start.

“Is there any village or hamlet near?” he asked the station-master.

“None nearer than Corfield. That is about half-a-mile from here.”

“And where is the nearest road?”

“There is a half-made road that runs past a house about three hundred yards from here. It belonged to a building estate that was never built. There is a footpath from it to the station.”

“Are there any other houses near?”

“No. That is the only house for half-a-mile round, and there is no other road near here.”

“Then the probability is that Brodski approached the railway from that direction, as he was found on that side of the permanent way.”

The inspector agreeing with this view, we all set off slowly towards the house, piloted by the station-master and searching the ground as we went. The waste land over which we passed was covered with patches of docks and nettles, through each of which the inspector kicked his way, searching with feet and lantern for the missing hat. A walk of three hundred yards brought us to a low wall enclosing a garden, beyond which we could see a small house; and here we halted while the inspector waded into a large bed of nettles beside the wall and kicked vigorously. Suddenly there came a clinking sound mingled with objurgations, and the inspector hopped out holding one foot and soliloquizing profanely.

“I wonder what sort of a fool put a thing like that into a bed of nettles!” he exclaimed, stroking the injured foot. Thorndyke picked the object up and held it in the light of the lantern, displaying a piece of three-quarter inch rolled iron bar about a foot long. “It doesn’t seem to have been there very long,” he observed, examining it closely, “there is hardly any rust on it.”

“It has been there long enough for me,” growled the inspector, “and I’d like to bang it on the head of the blighter that put it there.”

Callously indifferent to the inspector’s sufferings, Thorndyke continued calmly to examine the bar. At length, resting his lantern on the wall, he produced his pocket-lens, with which he resumed his investigation, a proceeding that so exasperated the inspector that that afflicted official limped off in dudgeon, followed by the station-master, and we heard him, presently, rapping at the front door of the house.

“Give me a slide, Jervis, with a drop of Farrant on it,” said Thorndyke. “There are some fibres sticking to this bar.”

I prepared the slide, and, having handed it to him together with a cover-glass, a pair of forceps and a needle, set up the microscope on the wall.

“I’m sorry for the inspector,” Thorndyke remarked, with his eye applied to the little instrument, “but that was a lucky kick for us. Just take a look at the specimen.”

I did so, and, having moved the slide about until I had seen the whole of the object, I gave my opinion. “Red wool fibres, blue cotton fibres and some yellow vegetable fibres that look like jute.”

“Yes,” said Thorndyke; “the same combination of fibres as that which we found on the dead man’s teeth and probably
from the same source. This bar has probably been wiped on that very curtain or rug with which poor Brodski was stifled. We will place it on the wall for future reference, and meanwhile, by hook or by crook, we must get into that house. This is much too plain a hint to be disregarded.”

Hastily repacking the case, we hurried to the front of the house, where we found the two officials looking rather vaguely up the unmade road.

“There’s a light in the house,” said the inspector, “but there’s no one at home. I have knocked a dozen times and got no answer. And I don’t see what we are hanging about here for at all. The hat is probably close to where the body was found, and we shall find it in the morning.”

Thorndyke made no reply, but, entering the garden, stepped up the path, and having knocked gently at the door, stooped and listened attentively at the key-hole.

“I tell you there’s no one in the house, sir,” said the inspector irritably; and, as Thorndyke continued to listen, he walked away, muttering angrily. As soon as he was gone, Thorndyke flashed his lantern over the door, the threshold, the path and the small flower-beds; and, from one of the latter, I presently saw him stoop and pick something up.

“Here is a highly instructive object, Jervis,” he said, coming out to the gate, and displaying a cigarette of which only half-an-inch had been smoked.

“How instructive?” I asked. “What do you learn from it?”

“Many things,” he replied. “It has been lit and thrown away unsmoked; that indicates a sudden change of purpose. It was thrown away at the entrance to the house, almost certainly by someone entering it. That person was probably a stranger, or he would have taken it in with him. But he had not expected to enter the house, or he would not have lit it. These are the general suggestions; now as to the particular ones. The paper of the cigarette is of the kind known as the ‘Zig-Zag’ brand; the very conspicuous water-mark is quite easy to see. Now Brodski’s cigarette book was a ‘Zig-Zag’ book—so called from the way in which the papers pull out. But let us see what the tobacco is like.” With a pin from his coat, he hooked out from the unburned end a wisp of dark, dirty brown tobacco, which he held out for my inspection.

“Fine-cut Latakia,” I pronounced, without hesitation.

“Very well,” said Thorndyke. “Here is a cigarette made of an unusual tobacco similar to that in Brodski’s pouch and wrapped in an unusual paper similar to those in Brodski’s cigarette book. With due regard to the fourth rule of the syllogism, I suggest that this cigarette was made by Oscar Brodski. But, nevertheless, we will look for corroborative detail.”

“What is that?” I asked.

“You may have noticed that Brodski’s match-box contained round wooden vestas—which are also rather unusual. As he must have lighted the cigarette within a few steps of the gate, we ought to be able to find the match with which he lighted it. Let us try up the road in the direction from which he would probably have approached.”

We walked very slowly up the road, searching the ground with the lantern, and we had hardly gone a dozen paces when I espied a match lying on the rough path and eagerly picked it up. It was a round wooden vesta.

Thorndyke examined it with interest and having deposited it, with the cigarette, in his “collecting-box,” turned to retrace his steps. “There is now, Jervis, no reasonable doubt that Brodski was murdered in that house. We have succeeded in connecting that house with the crime, and now we have got to force an entrance and join up the other clues.” We walked quickly back to the rear of the premises, where we found the inspector conversing disconsolately with the station-master.

“I think, sir,” said the former, “we had better go back now; in fact, I don’t see what we came here for, but—here! I say, sir, you mustn’t do that!” For Thorndyke, without a word of warning, had sprung up lightly and thrown one of his long legs over the wall.

“I can’t allow you to enter private premises, sir,” continued the inspector; but Thorndyke quietly dropped down on the inside and turned to face the officer over the wall.

“Now, listen to me, inspector,” said he. “I have good reasons for believing that the dead man, Brodski, has been in this house, in fact, I am prepared to swear an information to that effect. But time is precious; we must follow the scent while it is hot. And I am not proposing to break into the house off-hand. I merely wish to examine the dust-bin.”

“The dust-bin!” gasped the inspector. “Well, you really are a most extraordinary gentleman! What do you expect to find in the dust-bin?”

“I am looking for a broken tumbler or wine-glass. It is a thin glass vessel decorated with a pattern of small, eight-pointed stars. It may be in the dust-bin or it may be inside the house.”

The inspector hesitated, but Thorndyke’s confident manner had evidently impressed him.

“We can soon see what is in the dust-bin,” he said, “though what in creation a broken tumbler has to do with the case is more than I can understand. However, here goes.” He sprang up onto the wall, and, as he dropped down into the garden, the station-master and I followed.

Thorndyke lingered a few moments by the gate examining the ground, while the two officials hurried up the path. Finding nothing of interest, however, he walked towards the house, looking keenly about him as he went; but we were
hardly half-way up the path when we heard the voice of the inspector calling excitedly.

“Here you are, sir, this way,” he sang out, and, as we hurried forward, we suddenly came on the two officials standing over a small rubbish-heap and looking the picture of astonishment. The glare of their lanterns illuminated the heap, and showed us the scattered fragments of a thin glass, star-pattern tumbler.

“I can’t imagine how you guessed it was here, sir,” said the inspector, with a new-born respect in his tone, “nor what you’re going to do with it now you have found it.”

“It is merely another link in the chain of evidence,” said Thorndyke, taking a pair of forceps from the case and stooping over the heap. “Perhaps we shall find something else.” He picked up several small fragments of glass, looked at them closely and dropped them again. Suddenly his eye caught a small splinter at the base of the heap. Seizing it with the forceps, he held it close to his eye in the strong lamplight, and, taking out his lens, examined it with minute attention.

“Yes,” he said at length, “this is what I was looking for. Let me have those two cards, Jervis.”

I produced the two visiting-cards with the reconstructed lenses stuck to them, and, laying them on the lid of the case, threw the light of the lantern on them. Thorndyke looked at them intently for some time, and from them to the fragment that he held. Then, turning to the inspector, he said: “You saw me pick up this splinter of glass?”

“Yes, sir,” replied the officer.

“And you saw where we found these spectacle-glasses and know whose they were?”

“Yes, sir. They are the dead man’s spectacles, and you found them where the body had been.”

“Very well,” said Thorndyke; “now observe;” and, as the two officials craned forward with parted lips, he laid the little splinter in a gap in one of the lenses and then gave it a gentle push forward, when it occupied the gap perfectly, joining edge to edge with the adjacent fragments and rendering that portion of the lens complete.

“My God!” exclaimed the inspector. “How on earth did you know?”

“I must explain that later,” said Thorndyke. “Meanwhile we had better have a look inside the house. I expect to find there a cigarette—or possibly a cigar—which has been trodden on, some whole-meal biscuits, possibly a wooden vesta, and perhaps even the missing hat.”

At the mention of the hat, the inspector stepped eagerly to the back door, but, finding it bolted, he tried the window. This also was secretly fastened and, on Thorndyke’s advice, we went round to the front door.

“This door is locked too,” said the inspector. “I’m afraid we shall have to break in. It’s a nuisance, though.”

“Have a look at the window,” suggested Thorndyke. The officer did so, struggling vainly to undo the patent catch with his pocket-knife.

“It’s no go,” he said, coming back to the door. “We shall have to—?” He broke off with an astonished stare, for the door stood open and Thorndyke was putting something in his pocket.

“Your friend doesn’t waste much time—even in picking a lock,” he remarked to me, as we followed Thorndyke into the house; but his reflections were soon merged in a new surprise. Thorndyke had preceded us into a small sitting-room dimly lighted by a hanging lamp turned down low.

As we entered he turned up the light and glanced about the room. A whisky-bottle was on the table, with a siphon, a tumbler and a biscuit-box. Pointing to the latter, Thorndyke said to the inspector: “See what is in that box.”

The inspector raised the lid and peeped in, the station-master peered over his shoulder, and then both stared at Thorndyke.

“How in the name of goodness did you know that there were whole-meal biscuits in the house, sir?” exclaimed the station-master.

“You’d be disappointed if I told you,” replied Thorndyke. “But look at this.” He pointed to the hearth, where lay a flattened, half-smoked cigarette and a round wooden vesta. The inspector gazed at these objects in silent wonder, while, as to the station-master, he continued to stare at Thorndyke with what I can only describe as superstitious awe.

“You have the dead man’s property with you, I believe?” said my colleague.

“Yes,” replied the inspector; “I put the things in my pocket for safety.”

“Then,” said Thorndyke, picking up the flattened cigarette, “let us have a look at his tobacco-pouch.”

As the officer produced and opened the pouch, Thorndyke neatly cut open the cigarette with his sharp pocket-knife.

“Now,” said he, “what kind of tobacco is in the pouch?”

The inspector took out a pinch, looked at it and smelt it distastefully. “It’s one of those stinking tobaccos,” he said, “that they put in mixtures—Latakia, I think.”

“And what is this?” asked Thorndyke, pointing to the open cigarette.

“Same stuff, undoubtedly,” replied the inspector.
“And now let us see his cigarette papers,” said Thorndyke.

The little book, or rather packet—for it consisted of separated papers—was produced from the officer’s pocket and a sample paper abstracted. Thorndyke laid the half-burnt paper beside it, and the inspector, having examined the two, held them up to the light.

“There isn’t much chance of mistaking that ‘Zig-Zag’ watermark,” he said. “This cigarette was made by the deceased; there can’t be the shadow of a doubt.”

“One more point,” said Thorndyke, laying the burnt wooden vesta on the table. “You have his match-box?”

The inspector brought forth the little silver casket, opened it and compared the wooden vestas that it contained with the burnt end. Then he shut the box with a snap.

“You’ve proved it up to the hilt,” said he. “If we could only find the hat, we should have a complete case.”

“I’m not sure that we haven’t found the hat,” said Thorndyke. “You notice that something besides coal has been burned in the grate.”

The inspector ran eagerly to the fire-place and began with feverish hands, to pick out the remains of the extinct fire. “The cinders are still warm,” he said, “and they are certainly not all coal cinders. There has been wood burned here on top of the coal, and these little black lumps are neither coal nor wood. They may quite possibly be the remains of a burnt hat, but, lord! who can tell? You can put together the pieces of broken spectacle-glasses, but you can’t build up a hat out of a few cinders.” He held out a handful of little, black, spongy cinders and looked ruefully at Thorndyke, who took them from him and laid them out on a sheet of paper.

“We can’t reconstitute the hat, certainly,” my friend agreed, “but we may be able to ascertain the origin of these remains. They may not be cinders of a hat, after all.” He lit a wax match and, taking up one of the charred fragments, applied the flame to it. The cindery mass fused at once with a crackling, seething sound, emitting a dense smoke, and instantly the air became charged with a pungent, resinous odour mingled with the smell of burning animal matter.

“Smells like varnish,” the station-master remarked.

“Yes. Shellac,” said Thorndyke; “so the first test gives a positive result. The next test will take more time.”

He opened the green case and took from it a little flask, fitted for Marsh’s arsenic test, with a safety funnel and escape tube, a small folding tripod, a spirit lamp and a disc of asbestos to serve as a sand-bath. Dropping into the flask several of the cindery masses, selected after careful inspection, he filled it up with alcohol and placed it on the disc, which he rested on the tripod. Then he lighted the spirit lamp underneath and sat down to wait for the alcohol to boil.

“There is one little point that we may as well settle,” he said presently, as the bubbles began to rise in the flask. “Give me a slide with a drop of Farrant on it, Jervis.”

I prepared the slide while Thorndyke, with a pair of forceps, picked out a tiny wisp from the table-cloth. “I fancy we have seen this fabric before,” he remarked, as he laid the little pinch of fluff in the mounting fluid and slipped the slide onto the stage of the microscope. “Yes,” he continued, looking into the eye-piece, “here are our old acquaintances, the red wool fibres, the blue cotton and the yellow jute. We must label this at once or we may confuse it with the other specimens.”

“Have you any idea how the deceased met his death?” the inspector asked.

“Yes,” replied Thorndyke. “I take it that the murderer enticed him into this room and gave him some refreshments. The murderer sat in the chair in which you are sitting, Brodski sat in that small arm-chair. Then I imagine the murderer attacked him with that iron bar that you found among the nettles, failed to kill him at the first stroke, struggled with him and finally suffocated him with the table-cloth. By the way, there is just one more point. You recognize this piece of string?” He took from his “collecting-box” the little end of twine that had been picked up by the line. The inspector nodded. “Look behind you, you will see where it came from.”

The officer turned sharply and his eye lighted on a string-box on the mantelpiece. He lifted it down, and Thorndyke drew out from it a length of white twine with one green strand, which he compared with the piece in his hand. “The green strand in it makes the identification fairly certain,” he said. “Of course the string was used to secure the umbrella and hand-bag. He could not have carried them in his hand, encumbered as he was with the corpse. But I expect our other specimen is ready now.” He lifted the flask off the tripod, and, giving it a vigorous shake, examined the contents through his lens. The alcohol had now become dark-brown in colour, and was noticeably thicker and more syrupy in consistence.

“I think we have enough here for a rough test,” said he, selecting a pipette and a slide from the case. He dipped the former into the flask and, having sucked up a few drops of the alcohol from the bottom, held the pipette over the slide on which he allowed the contained fluid to drop.

Laying a cover-glass on the little pool of alcohol, he put the slide on the microscope stage and examined it attentively, while we watched him in expectant silence.

At length he looked up, and, addressing the inspector, asked: “Do you know what felt hats are made of?”

“I can’t say that I do, sir,” replied the officer.

“Well, the better quality hats are made of rabbits’ and hares’ wool—the soft under-fur, you know—cemented together
with shellac. Now there is very little doubt that these cinders contain shellac, and with the microscope I find a number of small hairs of a rabbit. I have, therefore, little hesitation in saying that these cinders are the remains of a hard felt hat; and, as the hairs do not appear to be dyed, I should say it was a grey hat.”

At this moment our conclave was interrupted by hurried footsteps on the garden path and, as we turned with one accord, an elderly woman burst into the room.

She stood for a moment in mute astonishment, and then, looking from one to the other, demanded: “Who are you? and what are you doing here?”

The inspector rose. “I am a police officer, madam,” said he. “I can’t give you any further information just now, but, if you will excuse me asking, who are you?”

“I am Mr. Hickler’s housekeeper,” she replied.

“And Mr. Hickler; are you expecting him home shortly?”

“No, I am not,” was the curt reply. “Mr. Hickler is away from home just now. He left this evening by the boat train.”

“For Amsterdam?” asked Thorndyke.

“I believe so, though I don’t see what business it is of yours,” the housekeeper answered.

“I thought he might, perhaps, be a diamond broker or merchant,” said Thorndyke. “A good many of them travel by that train.”

“So he is,” said the woman, “at least, he has something to do with diamonds.”

“Ah. Well, we must be going, Jervis,” said Thorndyke, “we have finished here, and we have to find an hotel or inn. Can I have a word with you, inspector?”

The officer, now entirely humble and reverent, followed us out into the garden to receive Thorndyke’s parting advice.

“You had better take possession of the house at once, and get rid of the housekeeper. Nothing must be removed. Preserve those cinders and see that the rubbish-heap is not disturbed, and, above all, don’t have the room swept. An officer will be sent to relieve you.”

With a friendly “good-night” we went on our way, guided by the station-master; and here our connection with the case came to an end. Hickler (whose Christian name turned out to be Silas) was, it is true, arrested as he stepped ashore from the steamer, and a packet of diamonds, subsequently identified as the property of Oscar Brodski, found upon his person. But he was never brought to trial, for on the return voyage he contrived to elude his guards for an instant as the ship was approaching the English coast, and it was not until three days later, when a hand-cuffed body was cast up on the lonely shore by Orfordness, that the authorities knew the fate of Silas Hickler.

“An appropriate and dramatic end to a singular and yet typical case,” said Thorndyke, as he put down the newspaper. “I hope it has enlarged your knowledge, Jervis, and enabled you to form one or two useful corollaries.”

“I prefer to hear you sing the medico-legal doxology,” I answered, turning upon him like the proverbial worm and grinning derisively (which the worm does not).

“I know you do,” he retorted, with mock gravity, “and I lament your lack of mental initiative. However, the points that this case illustrates are these: First, the danger of delay; the vital importance of instant action before that frail and fleeting thing that we call a clue has time to evaporate. A delay of a few hours would have left us with hardly a single datum. Second, the necessity of pursuing the most trivial clue to an absolute finish, as illustrated by the spectacles. Third, the urgent need of a trained scientist to aid the police; and, last,” he concluded, with a smile, “we learn never to go abroad without the invaluable green case.”

II. — A CASE OF PREMEDITATION

THE wine merchant who should supply a consignment of petit vin to a customer who had ordered, and paid for, a vintage wine, would render himself subject to unambiguous comment. Nay! more; he would be liable to certain legal penalties. And yet his conduct would be morally indistinguishable from that of the railway company which, having accepted a first-class fare, inflicts upon the passenger that kind of company which he has paid to avoid. But the corporate conscience, as Herbert Spencer was wont to explain, is an altogether inferior product to that of the individual.

Such were the reflections of Mr. Rufus Pembury when, as the train was about to move out of Maidstone (West) station, a coarse and burly man (clearly a denizen of the third-class) was ushered into his compartment by the guard. He had paid the higher fare, not for cushioned seats, but for seclusion or, at least, select companionship. The man’s entry had deprived him of both, and he resented it.

But if the presence of this stranger involved a breach of contract, his conduct was a positive affront—an indignity; for, no sooner had the train started than he fixed upon Mr. Pembury a gaze of impertinent intensity, and continued thereafter to regard him with a stare as steady and unwinking as that of a Polynesian idol.
It was offensive to a degree, and highly disconcerting withal. Mr. Pembury fidgeted in his seat with increasing discomfort and rising temper. He looked into his pocket-book, read one or two letters and sorted a collection of visiting-cards. He even thought of opening his umbrella. Finally, his patience exhausted and his wrath mounting to boiling-point, he turned to the stranger with frosty remonstrance.

"I imagine, sir, that you will have no difficulty in recognizing me, should we ever meet again—which God forbid."

"I should recognize you among ten thousand," was the reply, so unexpected as to leave Mr. Pembury speechless.

"You see," the stranger continued impressively, "I've got the gift of faces. I never forget."

"That must be a great consolation," said Pembury.

"It's very useful to me," said the stranger, "at least, it used to be, when I was a warden at Portland—you remember me, I dare say: my name is Pratt. I was assistant-warden in your time. God-forsaken hole, Portland, and mighty glad I was when they used to send me up to town on reckernizing duty. Holloway was the house of detention then; you remember; that was before they moved to Brixton."

Pembury paused in his reminiscences, and Pembury, pale and gasping with astonishment, pulled himself together.

"I think," said he, "you must be mistaking me for someone else."

"I don't," replied Pratt. "You're Francis Dobbs, that's who you are. Slipped away from Portland one evening about twelve years ago. Clothes washed up on the Bill next day. No trace of fugitive. As neat a muzzle as ever I heard of. But there are a couple of photographs and a set of fingerprints at the Habitual Criminals Register. "P'r'aps you'd like to come and see 'em?"

"Why should I go to the Habitual Criminals Register?" Pembury demanded faintly.

"Ah! Exactly. Why should you? When you are a man of means, and a little judiciously invested capital would render it unnecessary?"

Pembury looked out of the window, and for a minute or more preserved a stony silence. At length he turned suddenly to Pratt. "How much?" he asked.

"I shouldn't think a couple of hundred a year would hurt you," was the calm reply.

Pembury reflected awhile. "What makes you think I am a man of means?" he asked presently.

Pratt smiled grimly. "Bless you, Mr. Pembury," said he, "I know all about you. Why, for the last six months I have been living within half-a-mile of your house."

"The devil you have!"

"Yes. When I retired from the service, General O'Gorman engaged me as a sort of steward or caretaker of his little place at Baysford—he's very seldom there himself—and the very day after I came down, I met you and spotted you, but, naturally, I kept out of sight myself. Thought I'd find out whether you were good for anything before I spoke, so I've been keeping my ears open and I find you are good for a couple of hundred."

There was an interval of silence, and then the ex-warder resumed—"That's what comes of having a memory for faces. Now there's Jack Ellis, on the other hand; he must have had you under his nose for a couple of years, and yet he's never twigged—he never will either," added Pratt, already regretting the confidence into which his vanity had led him.

"Who is Jack Ellis?" Pembury demanded sharply.

"Why, he's a sort of supernumerary at the Baysford Police Station; does odd jobs; rural detective, helps in the office and that sort of thing. He was in the Civil Guard at Portland, in your time, but he got his left forefinger chopped off, so they pensioned him, and, as he was a Baysford man, he got this billet. But he'll never reckernize you, don't you fear."

"Unless you direct his attention to me," suggested Pembury.

"There's no fear of that," laughed Pratt. "You can trust me to sit quiet on my own nest-egg. Besides, we're not very friendly. He came nosing round our place after the parlourmaid—him a married man, mark you! But I soon boosted him out, I can tell you; and Jack Ellis don't like me now."

"I see," said Pembury reflectively; then, after a pause, he asked: "Who is this General O'Gorman? I seem to know the name."

"I expect you do," said Pratt. "He was governor of Dartmoor when I was there—that was my last billet—and, let me tell you, if he'd been at Portland in your time, you'd never have got away."

"How is that?"

"Why, you see, the general is a great man on bloodhounds. He kept a pack at Dartmoor and, you bet, those lags knew it. There were no attempted escapes in those days. They wouldn't have had a chance."

"He has the pack still, hasn't he?" asked Pembury.

"Rather. Spends any amount of time on training 'em, too. He's always hoping there'll be a burglary or a murder in the neighbourhood so as he can try 'em, but he's never got a chance yet. P'r'aps the crooks have heard about 'em. But, to come back to our little arrangement: what do you say to a couple of hundred, paid quarterly, if you like?"
"I can't settle the matter off-hand," said Pembury. "You must give me time to think it over."

"Very well," said Pratt. "I shall be back at Baysford to-morrow evening. That will give you a clear day to think it over. Shall I look in at your place to-morrow night?"

"No," replied Pembury; "you'd better not be seen at my house, nor I at yours. If I meet you at some quiet spot, where we shan't be seen, we can settle our business without any one knowing that we have met. It won't take long, and we can't be too careful."

"That's true," agreed Pratt. "Well, I'll tell you what. There's an avenue leading up to our house; you know it, I expect. There's no lodge, and the gates are always ajar, excepting at night. Now I shall be down by the six-thirty at Baysford. Our place is a quarter of an hour from the station. Say you meet me in the avenue at a quarter to seven."

"That will suit me," said Pembury; "that is, if you are sure the bloodhounds won't be straying about the grounds."

"Lord bless you, no!" laughed Pratt. "D'you suppose the general lets his precious hounds stray about for any casual crook to feed with poisoned sausage? No, they're locked up safe in the kennels at the back of the house. Hallo! This'll be Swanley, I expect. I'll change into a smoker here and leave you time to turn the matter over in your mind. So long. To-morrow evening in the avenue at a quarter to seven. And, I say, Mr. Pembury, you might as well bring the first installment with you—fifty, in small notes or gold."

"Very well," said Mr. Pembury. He spoke coldly enough, but there was a flush on his cheeks and an angry light in his eyes, which, perhaps, the ex-warder noticed; for when he had stepped out and shut the door, he thrust his head in at the window and said threateningly—

"One more word, Mr. Pembury-Dobbs: no hanky-panky, you know. I'm an old hand and pretty fly, I am. So don't you try any chickery-pokery on me. That's all." He withdrew his head and disappeared, leaving Pembury to his reflections.

The nature of those reflections—-some telepathist transferring his attention for the moment from hidden courtyards or missing thimbles to more practical matters—could have conveyed them into the mind of Mr. Pratt, would have caused that quondam official some surprise and, perhaps, a little disquiet. For long experience of the criminal, as he appears when in durance, had produced some rather misleading ideas as to his behaviour when at large. In fact, the ex-warder had considerably under-estimated the ex-convict.

Rufus Pembury, to give his real name—for Dobbs was literally a nom de guerre—was a man of strong character and intelligence. So much so, that having tried the criminal career and found it not worth pursuing, he had definitely abandoned it. When the cattle-boat that picked him up off Portland Bill had landed him at an American port, he brought his entire ability and energy to bear on legitimate commercial pursuits, and with such success that, at the end of ten years, he was able to return to England with a moderate competence. Then he had taken a modest house near the little town of Baysford, where he had lived quietly on his savings for the last two years, holding aloof without much difficulty from the rather exclusive local society; and here he might have lived out the rest of his life in peace but for the unlucky chance that brought the man Pratt into the neighbourhood. With the arrival of Pratt his security was utterly destroyed.

There is something eminently unsatisfactory about a blackmailer. No arrangement with him has any permanent validity. No undertaking that he gives is binding. The thing which he has sold remains in his possession to sell over again. He pockets the price of emancipation, but retains the key of the fetters. In short, the blackmailer is a totally impossible person.

Such were the considerations that had passed through the mind of Rufus Pembury, even while Pratt was making his proposals; and those proposals he had never for an instant entertained. The ex-warder's advice to him to "turn the matter over in his mind" was unnecessary. For his mind was already made up. His decision was arrived at in the very moment when Pratt had disclosed his identity. The conclusion was self-evident. Before Pratt appeared he was living in peace and security. While Pratt remained, his liberty was precarious from moment to moment. If Pratt should disappear, his peace and security would return. Therefore Pratt must be eliminated.

It was a logical consequence.

The profound meditations, therefore, in which Pembury remained immersed for the remainder of the journey, had nothing whatever to do with the quarterly allowance; they were concerned exclusively with the elimination of ex-warder Pratt.

Now Rufus Pembury was not a ferocious man. He was not even cruel. But he was gifted with a certain magnanimous cynicism which ignored the trivialities of sentiment and regarded only the main issues. If a wisp hummed over his tea-cup, he would crush that wisp; but not with his bare hand. The wisp carried the means of aggression. That was the wisp's look-out. His concern was to avoid being stung.

So it was with Pratt. The man had elected, for his own profit, to threaten Pembury's liberty. Very well. He had done it at his own risk. That risk was no concern of Pembury's. His concern was his own safety.

When Pembury alighted at Charing Cross, he directed his steps (after having watched Pratt's departure from the station) to Buckingham Street, Strand, where he entered a quiet private hotel. He was apparently expected, for the manageress greeted him by his name as she handed him his key.

"Are you staying in town, Mr. Pembury?" she asked.
“No,” was the reply. “I go back to-morrow morning, but I may be coming up again shortly. By the way, you used to have an encyclopaedia in one of the rooms. Could I see it for a moment?”

“It is in the drawing-room,” said the manageress. “Shall I show you—but you know the way, don’t you?”

Certainly Mr. Pembury knew the way. It was on the first floor; a pleasant old-world room looking on the quiet old street; and on a shelf, amidst a collection of novels, stood the sedate volumes of Chambers’s Encyclopaedia.

That a gentleman from the country should desire to look up the subject of “hounds” would not, to a casual observer, have seemed unnatural. But when from hounds the student proceeded to the article on blood, and thence to one devoted to perfumes, the observer might reasonably have felt some surprise, and this surprise might have been augmented if he had followed Mr. Pembury’s subsequent proceedings, and specially if he had considered them as the actions of a man whose immediate aim was the removal of a superficial unit of the population.

Having deposited his bag and umbrella in his room, Pembury set forth from the hotel as one with a definite purpose; and his footsteps led, in the first place, to an umbrella shop on the Strand, where he selected a thick rattan cane. There was nothing remarkable in this, perhaps; but the cane was of an uncomely thickness and the salesman protested. “I like a thick cane,” said Pembury.

“Yes, sir; but for a gentleman of your height” (Pembury was a small, slightly-built man) “I would venture to suggest—?”

“I like a thick cane,” repeated Pembury. “Cut it down to the proper length and don’t rivet the ferrule on. I’ll cement it on when I get home.”

His next investment would have seemed more to the purpose, though suggestive of unexpected crudity of method. It was a large Norwegian knife. But not content with this he went on forthwith to a second cutler’s and purchased a second knife, the exact duplicate of the first. Now, for what purpose could he want two identically similar knives? And why not have bought them both at the same shop? It was highly mysterious.

Shopping appeared to be a positive mania with Rufus Pembury. In the course of the next half-hour he acquired a cheap hand-bag, an artist’s black-japanned brush-case, a three-cornered file, a stick of elastic glue and a pair of iron crucible-tongs. Still insatiable, he repaired to an old-fashioned chemist’s shop in a by-street, where he further enriched himself with a packet of absorbent cotton-wool and an ounce of permanganate of potash; and, as the chemist wrapped up these articles, with the occult and necromantic air peculiar to chemists, Pembury watched him impassively.

“I suppose you don’t keep musk?” he asked carelessly.

The chemist paused in the act of heating a stick of sealing-wax, and appeared as if about to mutter an incantation. But he merely replied: “No, sir. Not the solid musk; it’s so very costly. But I have the essence.”

“That isn’t as strong as the pure stuff, I suppose?”

“No,” replied the chemist, with a cryptic smile, “not so strong, but strong enough. These animal perfumes are so very penetrating, you know; and so lasting. Why, I venture to say that if you were to sprinkle a table-spoonful of the essence in the middle of St. Paul’s, the place would smell of it six months hence.”

“You don’t say so!” said Pembury. “Well, that ought to be enough for anybody. I’ll take a small quantity, please, and, for goodness’ sake, see that there isn’t any on the outside of the bottle. The stuff isn’t for myself, and I don’t want to go about smelling like a civet cat.”

“Naturally you don’t, sir,” agreed the chemist. He then produced an ounce bottle, a small glass funnel and a stoppered bottle labelled “Ess. Moschi,” with which he proceeded to perform a few trifling feats of legferdemain.

“There, sir,” said he, when he had finished the performance, “there is not a drop on the outside of the bottle, and, if I fit it with a rubber cork, you will be quite secure.”

Pembury’s dislike of musk appeared to be excessive, for, when the chemist had retired into a secret cubicle as if to hold converse with some familiar spirit (but actually to change half-a-crown), he took the brush-case from his bag, pulled off its lid, and then, with the crucible-tongs, daintily lifted the bottle off the counter, slid it softly into the brush-case, and, replacing the lid, returned the case and tongs to the bag. The other two packets he took from the counter and dropped into his pocket, and, when the presiding wizard, having miraculously transformed a single half-crown into four pennies, handed him the product, he left the shop and walked thoughtfully back towards the Strand. Suddenly a new idea seemed to strike him. He halted, considered for a few moments and then strode away northward to make the oddest of all his purchases.

The transaction took place in a shop in the Seven Dials, whose strange stock-in-trade ranged the whole zoological gamut, from water-snails to Angora cats. Pembury looked at a cage of guinea-pigs in the window and entered the shop.

“Do you happen to have a dead guinea-pig?” he asked.

“No; mine are all alive,” replied the man, adding, with a sinister grin: “But they’re not immortal, you know.”

Pembury looked at the man distastefully. There is an appreciable difference between a guinea-pig and a blackmailer. “Any small mammal would do,” he said.

“There’s a dead rat in that cage, if he’s any good,” said the man. “Died this morning, so he’s quite fresh.”
“I’ll take the rat,” said Pembury; “he’ll do quite well.”

The little corpse was accordingly made into a parcel and deposited in the bag, and Pembury, having tendered a complimentary fee, made his way back to the hotel.

After a modest lunch he went forth and spent the remainder of the day transacting the business which had originally brought him to town. He dined at a restaurant and did not return to his hotel until ten o’clock, when he took his key, and tucking under his arm a parcel that he had brought in with him, retired for the night. But before undressing—and after locking his door—he did a very strange and unaccountable thing. Having pulled off the loose ferrule from his newly-purchased cane, he bored a hole in the bottom of it with the spike end of the file. Then, using the latter as a broach, he enlarged the hole until only a narrow rim of the bottom was left. He next rolled up a small ball of cottonwool and pushed it into the ferrule; and having smeared the end of the cane with elastic glue, he replaced the ferrule, warming it over the gas to make the glue stick.

When he had finished with the cane, he turned his attention to one of the Norwegian knives. First, he carefully removed with the file most of the bright, yellow varnish from the wooden case or handle.

Then he opened the knife, and, cutting the string of the parcel that he had brought in, took from it the dead rat which he had bought at the zoologist’s. Laying the animal on a sheet of paper, he cut off its head, and, holding it up by the tail, allowed the blood that oozed from the neck to drop on the knife, spreading it over both sides of the blade and handle with his finger.

Then he laid the knife on the paper and softly opened the window. From the darkness below came the voice of a cat, apparently perfecting itself in the execution of chromatic scales; and in that direction Pembury flung the body and head of the rat, and closed the window. Finally, having washed his hands and stuffed the paper from the parcel into the fire-place, he went to bed.

But his proceedings in the morning were equally mysterious. Having breakfasted betimes, he returned to his bedroom and locked himself in. Then he tied his new cane, handle downwards, to the leg of the dressing-table. Next, with the crucible-tongs, he drew the little bottle of musk from the brush-case, and, having assured himself, by snifing at it, that the exterior was really free from odour, he withdrew the rubber cork. Then, slowly and with infinite care, he poured a few drops—or perhaps half-a-teaspoonful—of the essence on the cotton-wool that bulged through the hole in the ferrule, watching the absorbent material narrowly as it soaked up the liquid. When it was saturated he proceeded to treat the knife in the same fashion, letting fall a drop of the essence on the wooden handle—which soaked it up readily. This done, he slid up the window and looked out. Immediately below was a tiny yard in which grew, or rather survived, a couple of faded laurel bushes. The body of the rat was nowhere to be seen; it had apparently been spirited away in the night. Holding out the bottle, which he still held, he dropped it into the bushes, flinging the rubber cork after it.

His next proceeding was to take a tube of vaseline from his dressing-bag and squeeze a small quantity onto his fingers. With this he thoroughly smeared the shoulder of the brush-case and the inside of the lid, so as to ensure an air-tight joint. Having wiped his fingers, he picked the knife up with the crucible-tongs, and, dropping it into the brush-case, immediately pushed on the lid. Then he heated the tips of the tongs in the gas flame to destroy the scent, packed the tongs and brush-case in the bag, united the cane—carefully avoiding contact with the ferrule—and, taking up the two bags, went out, holding the cane by its middle.

There was no difficulty in finding an empty compartment, for first-class passengers were few at that time in the morning. Pembury waited on the platform until the guard’s whistle sounded, when he stepped into the compartment, shut the door and laid the cane on the seat with its ferrule projecting out of the off-side window, in which position it remained until the train drew up in Baysford station.

Pembury left his dressing-bag at the cloak-room, and, still grasping the cane by its middle, he sallied forth. The town of Baysford lay some half-a-mile to the east of the station; his own house was a mile along the road to the west; and half-way between his house and the station was the residence of General O’Gorman. He knew the place well. Originally a farmhouse, it stood on the edge of a great expanse of flat meadows and communicated with the road by an avenue, nearly three hundred yards long, of ancient trees. The avenue was shut off from the road by a pair of iron gates, but these were merely ornamental, for the place was unenclosed and accessible from the surrounding meadows—indeed, an indistinct footpath crossed the meadows and intersected the avenue about half-way up.

On this occasion Pembury, whose objective was the avenue, elected to approach it by the latter route; and at eachstile or fence that he surmounted, he paused to survey the country. Presently the avenue arose before him, lying athwart the narrow track, and, as he entered it between two of the trees, he halted and looked about him.

He stood listening for a while. Beyond the faint rustle of leaves no sound was to be heard. Evidently there was no one about, and, as Pratt was at large, it was probable that the general was absent.

And now Pembury began to examine the adjacent trees with more than a casual interest. The two between which he had entered were respectively an elm and a great pollard oak, the latter being an immense tree whose huge, warty bole divided about seven feet from the ground into three limbs, each as large as a fair-sized tree, of which the largest swept outward in a great curve half-way across the avenue. On this patriarch Pembury bestowed especial attention, walking completely round it and finally laying down his bag and cane (the latter resting on the bag with the ferrule off the ground) that he might climb up, by the aid of the warty outgrowths, to examine the crown; and he had just stepped up into the space between the
three limbs, when the creaking of the iron gates was followed by a quick step in the avenue. Hastily he let himself down from the tree, and, gathering up his possessions, stood close behind the great bole.

“Just as well not to be seen,” was his reflection, as he hugged the tree closely and waited, peering cautiously round the trunk. Soon a streak of moving shadow heralded the stranger’s approach, and he moved round to keep the trunk between himself and the intruder. On the footsteps came, until the stranger was abreast of the tree; and when he had passed Pembury peeped round at the retiring figure. It was only the postman, but then the man knew him, and he was glad he had kept out of sight.

Apparently the oak did not meet his requirements, for he stepped out and looked up and down the avenue. Then, beyond the elm, he caught sight of an ancient pollard hornbeam—a strange, fantastic tree whose trunk widened out trumpet-like above into a broad crown, from the edge of which multitudinous branches uprose like the limbs of some weird hamadryad.

That tree he approved at a glance, but he lingered behind the oak until the postman, returning with brisk step and cheerful whistle, passed down the avenue and left him once more in solitude. Then he moved on with a resolute air to the hornbeam.

The crown of the trunk was barely six feet from the ground. He could reach it easily, as he found on trying. Standing the cane against the tree—ferrule downwards, this time—he took the brush-case from the bag, pulled off the lid, and, with the crucible-tongs, lifted out the knife and laid it on the crown of the tree, just out of sight, leaving the tongs also invisible—still grasping the knife. He was about to replace the brush-case in the bag, when he appeared to alter his mind. Sniffing at it, and finding it reeking with the sickly perfume, he pushed the lid on again and threw the case up into the tree, where he heard it roll down into the central hollow of the crown. Then he closed the bag, and, taking the cane by its handle, moved slowly away in the direction whence he had come, passing out of the avenue between the elm and the oak.

His mode of progress was certainly peculiar. He walked with excessive slowness, trailing the cane along the ground, and every few paces he would stop and press the ferrule firmly against the earth, so that, to any one who should have observed him, he would have appeared to be wrapped in an absorbing reverie.

Thus he moved on across the fields, not, however, returning to the high road, but crossing another stretch of fields until he emerged into a narrow lane that led out into the High Street. Immediately opposite to the lane was the police station, distinguished from the adjacent cottages only by its lamp, its open door and the notices pasted up outside. Straight across the road Pembury walked, still trailing the cane, and halted at the station door to read the notices, resting his cane on the doorstep as he did so. Through the open doorway he could see a man writing at a desk. The man’s back was towards him, but, presently, a movement brought his left hand into view, and Pembury noted that the forefinger was missing. This, then, was Jack Ellis, late of the Civil Guard at Portland.

Even while he was looking the man turned his head, and Pembury recognized him at once. He had frequently met him on the road between Baysford and the adjoining village of Thorpe, and always at the same time. Apparently Ellis paid a daily visit to Thorpe—perhaps to receive a report from the rural constable—and he started between three and four and returned between seven and a quarter past.

Pembury looked at his watch. It was a quarter past three. He moved away thoughtfully (holding his cane, now, by the middle), and began to walk slowly in the direction of Thorpe—westward.

For a while he was deeply meditative, and his face wore a puzzled frown. Then, suddenly, his face cleared and he strode forward at a brisker pace. Presently he passed through a gap in the hedge, and, walking in a field parallel with the road, took out his purse—a small pigskin pouch.

Having frugally emptied it of its contents, excepting a few shillings, he thrust the ferrule of his cane into the small compartment ordinarily reserved for gold or notes.

And thus he continued to walk on slowly, carrying the cane by the middle and the purse jammed on the end.

At length he reached a sharp double curve in the road whence he could see back for a considerable distance; and here opposite a small opening, he sat down to wait. The hedge screened him effectually from the gaze of passers-by—though these were few enough—without interfering with his view.

A quarter of an hour passed. He began to be uneasy. Had he been mistaken? Were Ellis’s visits only occasional instead of daily, as he had thought? That would be tiresome though not actually disastrous. But at this point in his reflections a figure came into view, advancing along the road with a steady swing. He recognized the figure. It was Ellis.

But there was another figure advancing from the opposite direction: a labourer, apparently. He prepared to shift his ground, but another glance showed him that the labourer would pass first. He waited. The labourer came on and, at length, passed the opening, and, as he did so, Ellis disappeared for a moment in a bend of the road. Instantly Pembury passed his cane through the opening in the hedge, shook off the purse and pushed it into the middle of the foot-way. Then he crept forward, behind the hedge, towards the approaching official, and again sat down to wait. On came the steady tramp of the unconscious Ellis, and, as it passed, Pembury drew aside an obstructing branch and peered out at the retreating figure. The question now was, would Ellis see the purse? It was not a very conspicuous object.

The footsteps stopped abruptly. Looking out, Pembury saw the police official stoop, pick up the purse, examine its contents and finally stow it in his trousers pocket. Pembury heaved a sigh of relief; and, as the dwindling figure passed out of sight round a curve in the road, he rose, stretched himself and strode away briskly.
Near the gap was a group of ricks, and, as he passed them, a fresh idea suggested itself. Looking round quickly he passed to the farther side of one and, thrusting his cane deeply into it, pushed it home with a piece of stick that he picked up near the rick, until the handle was lost among the straw. The bag was now all that was left, and it was empty—for his other purchases were in the dressing-bag, which, by the way, he must fetch from the station. He opened it and smelt the interior, but, though he could detect no odour, he resolved to rid it of it if possible.

As he emerged from the gap a wagon jogged slowly past. It was piled high with sacks, and the tail-board was down. Stepping into the road, he quickly overtook the wagon, and, having glanced round, laid the bag lightly on the tail-board. Then he set off for the station.

On arriving home he went straight up to his bedroom, and, ringing for his housekeeper, ordered a substantial meal. Then he took off his clothes and deposited them, even to his shirt, socks and necktie, in a trunk, wherein his summer clothing was stored with a plentiful sprinkling of naphthol to preserve it from the moth. Taking the packet of permanganate of potash from his dressing-bag, he passed into the adjoining bathroom, and, tipping the crystals into the bath, turned on the water. Soon the bath was filled with a pink solution of the salt, and into this he plunged, immersing his entire body and thoroughly soaking his hair. Then he emptied the bath and rinsed himself in clear water, and, having dried himself, returned to the bedroom and dressed himself in fresh clothing. Finally he took a hearty meal, and then lay down on the sofa to rest until it should be time to start for the rendezvous.

Half-past six found him lurking in the shadow by the station-approach, within sight of the solitary lamp. He heard the train come in, saw the stream of passengers emerge, and noted one figure detach itself from the throng and turn on to the Thorpe road. It was Pratt, as the lamplight showed him; Pratt, striding forward to the meeting-place with an air of jaunty satisfaction and an uncommonly creaky pair of boots.

Pembury followed him at a safe distance, and rather by sound than sight, until he was well past the stile at the entrance to the footpath. Evidently he was going on to the gates. Then Pembury vaulted over the stile and strode away swiftly across the dark meadows.

When he plunged into the deep gloom of the avenue, his first act was to grope his way to the hornbeam and slip his hand up onto the crown and satisfy himself that the tongs were as he had left them. Reassured by the touch of his fingers on the iron loops, he turned and walked slowly down the avenue. The duplicate knife—ready opened—was in his left inside breast-pocket, and he fingered its handle as he walked.

Presently the iron gate squeaked mournfully, and then the rhythmical creak of a pair of boots was audible, coming up the avenue. Pembury walked forward slowly until a darker smear emerged from the surrounding gloom, when he called out—

"Is that you, Pratt?"

"That’s me," was the cheerful, if ungrammatical response, and, as he drew nearer, the ex-warder asked: “Have you brought the rhino, old man?”

The insolent familiarity of the man’s tone was agreeable to Pembury: it strengthened his nerve and hardened his heart. “Of course,” he replied; “but we must have a definite understanding, you know.”

"Look here," said Pratt, “I’ve got no time for jaw. The General will be here presently; he’s riding over from Bingfield with a friend. You hand over the dibs and we’ll talk some other time.”

"That is all very well," said Pembury, “but you must understand—?” He paused abruptly and stood still. They were now close to the hornbeam, and, as he stood, he stared up into the dark mass of foliage.

"What’s the matter?” demanded Pratt. “What are you staring at?” He, too, had held and stood gazing intently into the darkness.

Then, in an instant, Pembury whipped out the knife and drove it, with all his strength, into the broad back of the ex-warder, below the left shoulder-blade.

With a hideous yell Pratt turned and grappled with his assailant. A powerful man and a competent wrestler, too, he was far more than a match for Pembury unarmed, and, in a moment, he had him by the throat. But Pembury clung to him tightly, and, as they trampled to and fro and round and round, he stabbed again and again with the viciousness of a scorpion, while Pratt’s cries grew more gurgling and husky. Then they fell heavily to the ground, Pembury underneath. But the struggle was over. With a last bubbling groan, Pratt relaxed his hold and in a moment grew limp and inert. Pembury pushed him off and rose, trembling and breathing heavily.

But he wasted no time. There had been more noise than he had bargained for. Quickly stepping up to the hornbeam, he reached up for the tongs. His fingers slid into the looped handles; the tongs grasped the knife, and he lifted it out from its hiding-place and carried it to where the corpse lay, depositing it on the ground a few feet from the body. Then he went back to the tree and carefully pushed the tongs over into the hollow of the crown.

At this moment a woman’s voice sounded shrilly from the top of the avenue.

"Is that you, Mr. Pratt?” it called.

Pembury started and then stepped back quickly, on tiptoe, to the body. For there was the duplicate knife. He must take that away at all costs.
The corpse was lying on its back. The knife was underneath it, driven in to the very haft. He had to use both hands to lift the body, and even then he had some difficulty in disengaging the weapon. And, meanwhile, the voice, repeating its question, drew nearer.

At length he succeeded in drawing out the knife and thrust it into his breast-pocket. The corpse fell back, and he stood up gasping.

“Mr. Pratt! Are you there?” The nearness of the voice startled Pembury, and, turning sharply, he saw a light twinkling between the trees. And then the gates creaked loudly and he heard the crunch of a horse’s hoofs on the gravel.

He stood for an instant bewildered—utterly taken by surprise. He had not reckoned on a horse. His intended flight across the meadows towards Thorpe was now impracticable. If he were overtaken he was lost, for he knew there was blood on his clothes and his hands were wet and slippery—to say nothing of the knife in his pocket.

But his confusion lasted only for an instant. He remembered the oak tree; and, turning out of the avenue, he ran to it, and, touching it as little as he could with his bloody hands, climbed quickly up into the crown. The great horizontal limb was nearly three feet in diameter, and, as he lay out on it, gathering his coat closely round him, he was quite invisible from below.

He had hardly settled himself when the light which he had seen came into full view, revealing a woman advancing with a stable lantern in her hand. And, almost at the same moment, a streak of brighter light burst from the opposite direction. The horseman was accompanied by a man on a bicycle.

The two men came on apace, and the horseman, sighting the woman, called out: “Anything the matter, Mrs. Parton?” But, at that moment, the light of the bicycle lamp fell full on the prostrate corpse. The two men uttered a simultaneous cry of horror; the woman shrieked aloud: and then the horseman sprang from the saddle and ran forward to the body.

“Why,” he exclaimed, stooping over it, “it’s Pratt;” and, as the cyclist came up and the glare of his lamp shone on a great pool of blood, he added: “There’s been foul play here, Hanford.”

Hanford flashed his lamp around the body, lighting up the ground for several yards.

“What is that behind you, O’Gorman?” he said suddenly; “isn’t it a knife?” He was moving quickly towards it when O’Gorman held up his hand.

“Don’t touch it!” he exclaimed. “We’ll put the hounds onto it. They’ll soon track the scoundrel, whoever he is. By God! Hanford, this fellow has fairly delivered himself into our hands.” He stood for a few moments looking down at the knife with something uncommonly like exultation, and then, turning quickly to his friend, said: “Look here, Hanford; you ride off to the police station as hard as you can pelt. It is only three-quarters of a mile; you’ll do it in five minutes. Send or bring an officer and I’ll scour the meadows meanwhile. If I haven’t got the scoundrel when you come back, we’ll put the hounds onto this knife and run the beggar down.”

“Right,” replied Hanford, and without another word he wheeled his machine about, mounted and rode away into the darkness.

“Mrs. Parton,” said O’Gorman, “watch that knife. See that nobody touches it while I go and examine the meadows.”

“Is Mr. Pratt dead, sir?” whimpered Mrs. Parton.

“Gad! I hadn’t thought of that,” said the general. “You’d better have a look at him; but mind! nobody is to touch that knife or they will confuse the scent.”

He scrambled into the saddle and galloped away across the meadows in the direction of Thorpe; and, as Pembury listened to the diminuendo of the horse’s hoofs, he was glad that he had not attempted to escape; for that was the direction in which he had meant to go, and he would surely have been overtaken.

As soon as the general was gone, Mrs. Parton, with many a terror-stricken glance over her shoulder, approached the corpse and held the lantern close to the dead face. Suddenly she stood up, trembling violently, for footsteps were audible coming down the avenue. A familiar voice reassured her.

“Is anything wrong, Mrs. Parton?” The question proceeded from one of the maids who had come in search of the elder woman, escorted by a young man, and the pair now came out into the circle of light.

“Good God!” ejaculated the man. “Who’s that?”

“It’s Mr. Pratt,” replied Mrs. Parton. “He’s been murdered.”

The girl screamed, and then the two domestics approached on tiptoe, staring at the corpse with the fascination of horror.

“Don’t touch that knife,” said Mrs. Parton, for the man was about to pick it up. “The general’s going to put the bloodhounds onto it.”

“Is the general here, then?” asked the man; and, as he spoke, the drumming of hoofs, growing momentarily louder, answered him from the meadow.

O’Gorman reined in his horse as he perceived the group of servants gathered about the corpse. “Is he dead, Mrs. Parton?” he asked.
“I am afraid so, sir,” was the reply.

“Ha! Somebody ought to go for the doctor; but not you, Bailey. I want you to get the hounds ready and wait with them at the top of the avenue until I call you.”

He was off again into the Baysford meadows, and Bailey hurried away, leaving the two women staring at the body and talking in whispers.

Pembury’s position was cramped and uncomfortable. He dared not move, hardly dared to breathe, for the women below him were not a dozen yards away; and it was with mingled feelings of relief and apprehension that he presently saw from his elevated station a group of lights approaching rapidly along the road from Baysford. Presently they were hidden by the trees, and then, after a brief interval, the whirr of wheels sounded on the drive and streaks of light on the tree-trunks announced the new arrivals. There were three bicycles, ridden respectively by Mr. Hanford, a police inspector and a sergeant; and, as they drew up, the general came thundering back into the avenue.

“Is Ellis with you?” he asked, as he pulled up.

“No, sir,” was the reply. “He hadn’t come in from Thorpe when we left. He’s rather late to-night.”

“Have you sent for a doctor?”

“Yes, sir, I’ve sent for Dr. Hills,” said the inspector, resting his bicycle against the oak. Pembury could smell the reek of the lamp as he crouched. “Is Pratt dead?”

“Seems to be,” replied O’Gorman, “but we’d better leave that to the doctor. There’s the murderer’s knife. Nobody has touched it. I’m going to fetch the bloodhounds now.”

“Ah! that’s the thing,” said the inspector. “The man can’t be far away.” He rubbed his hands with a satisfied air as O’Gorman cantered away up the avenue.

In less than a minute there came out from the darkness the deep baying of a hound followed by quick footsteps on the gravel. Then into the circle of light emerged three sinister shapes, loose-limbed and gaunt, and two men advancing at a shambling trot.

“Here, inspector,” shouted the general, “you take one; I can’t hold ‘em both.”

The inspector ran forward and seized one of the leashes, and the general led his hound up to the knife, as it lay on the ground. Pembury, peering cautiously round the bough, watched the great brute with almost impersonal curiosity; noted its high poll, its wrinkled forehead and melancholy face as it stooped to snuff suspiciously at the prostrate knife.

For some moments the hound stood motionless, sniffing at the knife; then it turned away and walked to and fro with its muzzle to the ground. Suddenly it lifted its head, bayed loudly, lowered its muzzle and started forward between the oak and the elm, dragging the general after it at a run.

The inspector next brought his hound to the knife, and was soon bounding away to the tug of the leash in the general’s wake.

“They don’t make no mistakes, they don’t,” said Bailey, addressing the gratified sergeant, as he brought forward the third hound; “you’ll see—?” But his remark was cut short by a violent jerk of the leash, and the next moment he was flying after the others, followed by Mr. Hanford.

The sergeant daintily picked the knife up by its ring, wrapped it in his handkerchief and bestowed it in his pocket. Then he ran off after the hounds.

Pembury smiled grimly. His scheme was working out admirably in spite of the unforeseen difficulties. If those confounded women would only go away, he could come down and take himself off while the course was clear. He listened to the baying of the hounds, gradually growing fainter in the increasing distance, and cursed the dilatoriness of the doctor. Confound the fellow! Didn’t he realize that this was a case of life or death?

Suddenly his ear caught the tinkle of a bicycle bell; a fresh light appeared coming up the avenue and then a bicycle swept up swiftly to the scene of the tragedy, and a small elderly man jumped down by the side of the body. Giving his machine to Mrs. Parton, he stooped over the dead man, felt the wrist, pushed back an eyelid, held a match to the eye and then rose.

“This is a shocking affair, Mrs. Parton,” said he. “The poor fellow is quite dead. You had better help me to carry him to the house. If you two take the feet I will take the shoulders.”

Pembury watched them raise the body and stagger away with it up the avenue. He heard their shuffling steps die away and the door of the house shut. And still he listened. From far away in the meadows came, at intervals, the baying of the hounds. Other sounds there was none. Presently the doctor would come back for his bicycle, but, for the moment, the coast was clear. Pembury rose stiffly. His hands had stuck to the tree where they had pressed against it, and they were still sticky and damp. Quickly he let himself down to the ground, listened again for a moment, and then, making a small circuit to avoid the lamplight, softly crossed the avenue and stole away across the Thorpe meadows.

The night was intensely dark, and not a soul was stirring in the meadows. He strode forward quickly, peering into the darkness and stopping now and again to listen; but no sound came to his ears, save the now faint baying of the distant hounds. Not far from his house, he remembered, was a deep ditch spanned by a wooden bridge, and towards this he now
made his way; for he knew that his appearance was such as to convict him at a glance. Arrived at the ditch, he stooped to wash his hands and wrists; and, as he bent forward, the knife fell from his breast-pocket into the shallow water at the margin. He groped for it, and, having found it, drove it deep into the mud as far out as he could reach. Then he wiped his hands on some water-weed, crossed the bridge and started homewards.

He approached his house from the rear, satisfied himself that his housekeeper was in the kitchen, and, letting himself in very quietly with his key, went quickly up to his bedroom. Here he washed thoroughly—in the bath, so that he could get rid of the discoloured water—changed his clothes and packed those that he took off in a portmanteau.

By the time he had done this the gong sounded for supper. As he took his seat at the table, spruce and fresh in appearance, quietly cheerful in manner, he addressed his housekeeper. “I wasn’t able to finish my business in London,” he said. “I shall have to go up again to-morrow.”

“Shall you come home the same day?” asked the housekeeper.

“Perhaps,” was the reply, “and perhaps not. It will depend on circumstances.”

He did not say what the circumstances might be, nor did the housekeeper ask. Mr. Pembury was not addicted to confidences. He was an eminently discreet man: and discreet men say little.

PART II. — RIVAL SLEUTH-HOUNDS

(RELATED BY CHRISTOPHER JERVIS, M.D.)

THE half-hour that follows breakfast, when the fire has, so to speak, got into its stride, and the morning pipe throws up its clouds of incense, is, perhaps, the most agreeable in the whole day. Especially so when a sombre sky, brooding over the town, hints at streets pervaded by the chilly morning air, and hoots from protesting tugs upon the river tell of lingering mists, the legacy of the lately-vanished night.

The autumn morning was raw: the fire burned jovially. I thrust my slippered feet towards the blaze and meditated, on nothing in particular, with cat-like enjoyment. Presently a disapproving grunt from Thorndyke attracted my attention, and I looked round lazily. He was extracting, with a pair of office shears, the readable portions of the morning paper, and had paused with a small cutting between his finger and thumb. “Bloodhounds again,” said he. “We shall be hearing presently of the revival of the ordeal by fire.”

“And a deuced comfortable ordeal, too, on a morning like this,” I said, stroking my legs ecstatically. “What is the case?”

He was about to reply when a sharp rat-tat from the little brass knocker announced a disturber of our peace. Thorndyke stepped over to the door and admitted a police inspector in uniform, and I stood up, and, presenting my dorsal aspect to the fire, prepared to combine bodily comfort with attention to business.

“I believe I am speaking to Dr. Thorndyke,” said the officer, and, as Thorndyke nodded, he went on: “My name, sir, is Fox, Inspector Fox of the Baysford Police. Perhaps you’ve seen the morning paper?”

Thorndyke held up the cutting, and, placing a chair by the fire, asked the inspector if he had breakfasted.

“Thank you, sir, I have,” replied Inspector Fox. “I came up to town by the late train last night so as to be here early, and stayed at an hotel. You see, from the paper, that we have had to arrest one of our own men. That’s rather awkward, you know, sir.”

“Very,” agreed Thorndyke.

“Yes; it’s bad for the force and bad for the public too. But we had to do it. There was no way out that we could see. Still, we should like the accused to have every chance, both for our sake and his own, so the chief constable thought he’d like to have your opinion on the case, and he thought that, perhaps, you might be willing to act for the defence.”

“Let us have the particulars,” said Thorndyke, taking a writing-pad from a drawer and dropping into his armchair. “Begin at the beginning,” he added, “and tell us all you know.”

“Well,” said the inspector, after a preliminary cough, “to begin with the murdered man: his name is Pratt. He was a retired prison warder, and was employed as steward by General O’Gorman, who is a retired prison governor—you may have heard of him in connection with his pack of bloodhounds. Well, Pratt came down from London yesterday evening by a train arriving at Baysford at six-thirty. He was seen by the guard, the ticket collector and the outside porter. The porter saw him leave the station at six-thirty-seven. General O’Gorman’s house is about half-a-mile from the station. At five minutes to seven the general and a gentleman named Hanford and the general’s housekeeper, a Mrs. Parton, found Pratt lying dead in the avenue that leads up to the house. He had apparently been stabbed, for there was a lot of blood about, and a knife—a Norwegian knife—was lying on the ground near the body. Mrs. Parton had thought she heard someone in the avenue calling out for help, and, as Pratt was just due, she came out with a lantern. She met the general and Mr. Hanford, and all three seem to have caught sight of the body at the same moment. Mr. Hanford cycled down to us, at once, with the news; we sent for a doctor, and I went back with Mr. Hanford and took a sergeant with me. We arrived at twelve minutes past seven, and then the general, who had galloped his horse over the meadows each side of the avenue without having seen anybody, fetched out his bloodhounds and led them up to the knife. All three hounds took up the scent at once—I held the leash of one of them—and they took us across the meadows without a pause or a falter, over stiles and fences, along a lane,
out into the town, and then, one after the other, they crossed the road in a bee-line to the police station, bolted in at the
door, which stood open, and made straight for the desk, where a supernumerary officer, named Ellis, was writing. They
made a rare to-do, struggling to get at him, and it was as much as we could manage to hold them back. As for Ellis, he
turned as pale as a ghost.”

“Was any one else in the room?” asked Thorndyke.

“Oh, yes. There were two constables and a messenger. We led the hounds up to them, but the brutes wouldn’t take any
notice of them. They wanted Ellis.”

“And what did you do?”

“Why, we arrested Ellis, of course. Couldn’t do anything else—especially with the general there.”

“What had the general to do with it?” asked Thorndyke.

“He’s a J.P. and a late governor of Dartmoor, and it was his hounds that had run the man down. But we must have
arrested Ellis in any case.”

“Is there anything against the accused man?”

“Yes, there is. He and Pratt were on distinctly unfriendly terms. They were old comrades, for Ellis was in the Civil Guard
at Portland when Pratt was warden there—he was pensioned off from the service because he got his left forefinger chopped
off—but lately they had had some unpleasantness about a woman, a parlourmaid of the general’s. It seems that Ellis, who
is a married man, paid the girl too much attention—or Pratt thought he did—and Pratt warned Ellis off the premises. Since
then they had not been on speaking terms.”

“And what sort of a man is Ellis?”

“A remarkably decent fellow he always seemed; quiet, steady, good-natured; I should have said he wouldn’t have hurt a
fly. We all liked him—butter than we liked Pratt, in fact; poor Pratt was what you’d call an old soldier—sly, you know, sir—and a bit of a sneak.”

“You searched and examined Ellis, of course?”

“Yes. There was nothing suspicious about him except that he had two purses. But he says he picked up one of them? a
small, pigskin pouch—on the footpath of the Thorpe road yesterday afternoon; and there’s no reason to disbelieve him. At
any rate, the purse was not Pratt’s.”

Thorndyke made a note on his pad, and then asked: “There were no blood-stains or marks on his clothing?”

“No. His clothing was not marked or disarranged in any way.”

“Any cuts, scratches or bruises on his person?”

“None whatever,” replied the inspector.

“At what time did you arrest Ellis?”

“Half-past seven exactly.”

“Have you ascertained what his movements were? Had he been near the scene of the murder?”

“Yes; he had been to Thorpe and would pass the gates of the avenue on his way back. And he was later than usual in
returning, though not later than he has often been before.”

“And now, as to the murdered man: has the body been examined?”

“Yes; I had Dr. Hills’s report before I left. There were no less than seven deep knife-wounds, all on the left side of the
back. There was a great deal of blood on the ground, and Dr. Hills thinks Pratt must have bled to death in a minute or two.”

“Do the wounds correspond with the knife that was found?”

“I asked the doctor that, and he said ‘Yes,’ though he wasn’t going to swear to any particular knife. However, that point
isn’t of much importance. The knife was covered with blood, and it was found close to the body.”

“What has been done with it, by the way?” asked Thorndyke.

“The sergeant who was with me picked it up and rolled it in his handkerchief to carry in his pocket. I took it from him,
just as it was, and locked it in a dispatch-box.”

“Has the knife been recognized as Ellis’s property?”

“No, sir, it has not.”

“Were there any recognizable footprints or marks of a struggle?” Thorndyke asked.

The inspector grinned sheepishly. “I haven’t examined the spot, of course, sir,” said he, “but, after the general’s horse
and the bloodhounds and the general on foot and me and the gardener and the sergeant and Mr. Hanford had been over it
twice, going and returning, why, you see, sir—?”

“Exactly, exactly,” said Thorndyke. “Well, inspector, I shall be pleased to act for the defence; it seems to me that the case
against Ellis is in some respects rather inconclusive."

The inspector was frankly amazed. "It certainly hadn't struck me in that light, sir," he said.

"No? Well, that is my view; and I think the best plan will be for me to come down with you and investigate matters on the spot."

The inspector assented cheerfully, and, when we had provided him with a newspaper, we withdrew to the laboratory to consult time-tables and prepare for the expedition.

"You are coming, I suppose, Jervis?" said Thorndyke.

"If I shall be of any use," I replied.

"Of course you will," said he. "Two heads are better than one, and, by the look of things, I should say that ours will be the only ones with any sense in them. We will take the research case, of course, and we may as well have a camera with us. I see there is a train from Charing Cross in twenty minutes."

For the first half-hour of the journey Thorndyke sat in his corner, alternately conning over his notes and gazing with thoughtful eyes out of the window. I could see that the case pleased him, and was careful not to break in upon his train of thought. Presently, however, he put away his notes and began to fill his pipe with a more companionable air, and then the inspector, who had been wriggling with impatience, opened fire.

"So you think, sir, that you see a way out for Ellis?"

"I think there is a case for the defence," replied Thorndyke. "In fact, I call the evidence against him rather flimsy."

The inspector gasped. "But the knife, sir? What about the knife?"

"Well," said Thorndyke, "what about the knife? Whose knife was it? You don't know. It was covered with blood. Whose blood? You don't know. Let us assume, for the sake of argument, that it was the murderer's knife. Then the blood on it was Pratt's blood. But if it was Pratt's blood, when the hounds had smelt it they should have led you to Pratt's body, for blood gives a very strong scent. But they did not. They ignored the body. The inference seems to be that the blood on the knife was not Pratt's blood."

The inspector took off his cap and gently scratched the back of his head. "You're perfectly right, sir," he said. "I'd never thought of that. None of us had."

"Then," pursued Thorndyke, "let us assume that the knife was Pratt's. If so, it would seem to have been used in self-defence. But this was a Norwegian knife, a clumsy tool—not a weapon at all—which takes an appreciable time to open and requires the use of two free hands. Now, had Pratt both hands free? Certainly not after the attack had commenced. There were seven wounds, all on the left side of the back; which indicates that he held the murderer locked in his arms and that the murderer's arms were around him. Also, incidentally, that the murderer is right-handed. But, still, let us assume that the knife was Pratt's. Then the blood on it was that of the murderer. Then the murderer must have been wounded. But Ellis was not wounded. Then Ellis is not the murderer. The knife doesn't help us at all."

The inspector puffed out his cheeks and blew softly. "This is getting out of my depth," he said. "Still, sir, you can't get over the bloodhounds. They tell us distinctly that the knife is Ellis's knife and I don't see any answer to that."

"There is no answer because there has been no statement. The bloodhounds have told you nothing. You have drawn certain inferences from their actions, but those inferences may be totally wrong and they are certainly not evidence."

"You don't seem to have much opinion of bloodhounds," the inspector remarked.

"As agents for the detection of crime," replied Thorndyke, "I regard them as useless. You cannot put a bloodhound in the witness-box. You can get no intelligible statement from it. If it possesses any knowledge, it has no means of communicating it. The fact is," he continued, "that the entire system of using bloodhounds for criminal detection is based on a fallacy. In the American plantations these animals were used with great success for tracking runaway slaves. But the slave was a known individual. All that was required was to ascertain his whereabouts. That is not the problem that is presented in the detection of a crime. The detective is not concerned in establishing the whereabouts of a known individual, but in discovering the identity of an unknown individual. And for this purpose bloodhounds are useless. They may discover such identity, but they cannot communicate their knowledge. If the criminal is unknown, they cannot identify him: if he is known, the police have no need of the bloodhound."

"To return to our present case," Thorndyke resumed, after a pause; "we have employed certain agents—the hounds—with whom we are not on rapport, as the spiritualists would say; and we have no 'medium.' The hound possesses a special sense—the olfactory—which in man is quite rudimentary. He thinks, so to speak, in terms of smell, and his thoughts are untranslatable to beings in whom the sense of smell is undeveloped. We have presented to the hound a knife, and he discovers in it certain odorous properties; he discovers similar or related odorous properties in a tract of land and a human individual—Ellis. We cannot verify his discoveries or ascertain their nature. What remains? All that we can say is that there appears to exist some odorous relation between the knife and the man Ellis. But until we can ascertain the nature of that relation, we cannot estimate its evidential value or bearing. All the other 'evidence' is the product of your imagination and that of the general. There is, at present, no case against Ellis."

"He must have been pretty close to the place when the murder happened," said the inspector.
“So, probably, were many other people,” answered Thorndyke; “but had he time to wash and change? Because he would have needed it.”

“I suppose he would,” the inspector agreed dubiously.

“Undoubtedly. There were seven wounds which would have taken some time to inflict. Now we can’t suppose that Pratt stood passively while the other man stabbed him. Indeed, as I have said, the position of the wounds shows that he did not. There was a struggle. The two men were locked together. One of the murderer’s hands was against Pratt’s back; probably both hands were, one clasping and the other stabbing. There must have been blood on one hand and probably on both. But you say there was no blood on Ellis, and there doesn’t seem to have been time or opportunity for him to wash.”

“Well, it’s a mysterious affair,” said the inspector; “but I don’t see how you are going to get over the bloodhounds.”

Thorndyke shrugged his shoulders impatiently. “The bloodhounds are an obsession,” he said. “The whole problem really centres around the knife. The questions are, Whose knife was it? and what was the connection between it and Ellis? There is a problem, Jervis,” he continued, turning to me, “that I submit for your consideration. Some of the possible solutions are exceedingly curious.”

As we set out from Baysford station, Thorndyke looked at his watch and noted the time. “You will take us the way that Pratt went,” he said.

“As to that,” said the inspector, “he may have gone by the road or by the footpath; but there’s very little difference in the distance.”

Turning away from Baysford, we walked along the road westward, towards the village of Thorpe, and presently passed on our right a stile at the entrance to a footpath.

“That path,” said the inspector, “crosses the avenue about half-way up. But we’d better keep to the road.” A quarter of a mile further on we came to a pair of rusty iron gates one of which stood open, and, entering, we found ourselves in a broad drive bordered by two rows of trees, between the trunks of which a long stretch of pasture meadows could be seen on either hand. It was a fine avenue, and, late in the year as it was, the yellowing foliage clustered thickly overhead.

When we had walked about a hundred and fifty yards from the gates, the inspector halted.

“This is the place,” he said; and Thorndyke noted the time.

“Nine minutes exactly,” said he. “Then Pratt arrived here about fourteen minutes to seven, and his body was found at five minutes to seven—nine minutes after his arrival. The murderer couldn’t have been far away then.”

“No, it was a pretty fresh scent,” replied the inspector. “You’d like to see the body first, I think you said, sir?”

“Yes; and the knife, if you please.”

“I shall have to send down to the station for that. It’s locked up in the office.”

He entered the house, and, having dispatched a messenger to the police station, came out and conducted us to the outbuilding where the corpse had been deposited. Thorndyke made a rapid examination of the wounds and the holes in the clothing, neither of which presented anything particularly suggestive. The weapon used had evidently been a thick-backed, single-edged knife similar to the one described, and the discoloration around the wounds indicated that the weapon had a definite shoulder like that of a Norwegian knife, and that it had been driven in with savage violence.

“Do you find anything that throws any light on the case?” the inspector asked, when the examination was concluded.

“That is impossible to say until we have seen the knife,” replied Thorndyke; “but while we are waiting for it, we may as well go and look at the scene of the tragedy. These are Pratt’s boots, I think?” He lifted a pair of stout laced boots from the table and turned them up to inspect the soles.

“Yes, those are his boots,” replied Fox, “and pretty easy they’d have been to track, if the case had been the other way about. Those Blakey’s protectors are as good as a trademark.”

“We’ll take them, at any rate,” said Thorndyke; and, the inspector having taken the boots from him, we went out and retraced our steps down the avenue.

The place where the murder had occurred was easily identified by a large dark stain on the gravel at one side of the drive, half-way between two trees—an ancient pollard hornbeam and an elm. Next to the elm was a pollard oak with a squat, warty bole about seven feet high, and three enormous limbs, of which one slanted half-way across the avenue; and between these two trees the ground was covered with the tracks of men and hounds superimposed upon the hoof-prints of a horse.

“Where was the knife found?” Thorndyke asked.

The inspector indicated a spot near the middle of the drive, almost opposite the hornbeam and Thorndyke, picking up a large stone, laid it on the spot. Then he surveyed the scene thoughtfully, looking up and down the drive and at the trees that bordered it, and, finally, walked slowly to the space between the elm and the oak, scanning the ground as he went. “There is no dearth of footprints,” he remarked grimly, as he looked down at the trampled earth.

“No, but the question is, whose are they?” said the inspector.

“Yes, that is the question,” agreed Thorndyke; “and we will begin the solution by identifying those of Pratt.”
“I don’t see how that will help us,” said the inspector. “We know he was here.”

Thorndyke looked at him in surprise, and I must confess that the foolish remark astonished me too, accustomed as I was to the quick-witted officers from Scotland Yard.

“The hue and cry procession,” remarked Thorndyke, “seems to have passed out between the elm and the oak; elsewhere the ground seems pretty clear.” He walked round the elm, still looking earnestly at the ground, and presently continued: “Now here, in the soft earth bordering the turf, are the prints of a pair of smallish feet wearing pointed boots; a rather short man, evidently, by the size of foot and length of stride, and he doesn’t seem to have belonged to the procession. But I don’t see any of Pratt’s; he doesn’t seem to have come off the hard gravel.” He continued to walk slowly towards the hornbeam with his eyes fixed on the ground. Suddenly he halted and stooped with an eager look at the earth; and, as Fox and I approached, he stood up and pointed. “Pratt’s footprints—faint and fragmentary, but unmistakable. And now, inspector, you see their importance. They furnish the time factor in respect of the other footprints. Look at this one and then look at that.” He pointed from one to another of the faint impressions of the dead man’s foot.

“You mean that there are signs of a struggle?” said Fox.

“I mean more than that,” replied Thorndyke. “Here is one of Pratt’s footprints treading into the print of a small, pointed foot; and there at the edge of the gravel is another of Pratt’s nearly obliterated by the tread of a pointed foot. Obviously the first pointed footprint was made before Pratt’s, and the second one after his; and the necessary inference is that the owner of the pointed foot was here at the same time as Pratt.”

“Then he must have been the murderer!” exclaimed Fox.

“Presumably,” answered Thorndyke; “but let us see whither he went. You notice, in the first place, that the man stood close to this tree”—he indicated the hornbeam—“and that he went towards the elm. Let us follow him. He passes the elm, you see, and you will observe that these tracks form a regular series leading from the hornbeam and not mixed up with the marks of the struggle. They were, therefore, probably made after the murder had been perpetrated. You will also notice that they pass along the backs of the trees—outside the avenue, that is; what does that suggest to you?”

“It suggests to me,” I said, when the inspector had shaken his head hopelessly, “that there was possibly someone in the avenue when the man was stealing off.”

“Precisely,” said Thorndyke. “The body was found not more than nine minutes after Pratt arrived here. But the murderer must have taken some time. Then the housekeeper thought she heard someone calling and came out with a lantern, and, at the same time, the general and Mr. Hanford came up the drive. The suggestion is that the man sneaked along outside the trees to avoid being seen. However, let us follow the tracks. They pass the elm and they pass on behind the next tree; but wait! There is something odd here.” He passed behind the great pollard oak and looked down at the soft earth by its roots. “Here is a pair of impressions much deeper than the rest, and they are not a part of the track since their toes point towards the tree. What do you make of that?” Without waiting for an answer he began closely to scan the bole of the tree and especially a large, warty protuberance about three feet from the ground. On the bark above this was a vertical mark, as if something had scraped down the tree, and from the wart itself a dead twig had been newly broken off and lay upon the ground. Pointing to these marks Thorndyke set his foot on the protuberance, and, springing up, brought his eye above the level of the crown, whence the great boughs branched off.

“Ah!” he exclaimed. “Here is something much more definite.” With the aid of another projection, he scrambled up into the crown of the tree, and, having glanced quickly round, beckoned to us. I stepped up on the projecting lump and, as my eyes rose above the crown, I perceived the brown, shiny impression of a hand on the edge. Climbing into the crown, I was quickly followed by the inspector, and we both stood up by Thorndyke between the three boughs. From where we stood we looked on the upper side of the great limb that swept out across the avenue; and there on its lichen-covered surface, we saw the imprints in reddish-brown of a pair of open hands.

“You notice,” said Thorndyke, leaning out upon the bough, “that he is a short man; I cannot conveniently place my hands so low. You also note that he has both forefingers intact, and so is certainly not Ellis.”

“If you mean to say, sir, that these marks were made by the murderer,” said Fox, “I say it’s impossible. Why, that would mean that he was here looking down at us when we were searching for him with the hounds. The presence of the hounds proves that this man could not have been the murderer.”

“On the contrary,” said Thorndyke, “the presence of this man with bloody hands confirms the other evidence, which all indicates that the hounds were never on the murderer’s trail at all. Come now, inspector, I put it to you: Here is a murdered man; the murderer has almost certainly blood upon his hands; and here is a man with bloody hands, lurking in a tree within a few feet of the corpse and within a few minutes of its discovery (as is shown by the footprints); what are the reasonable probabilities?”

“But you are forgetting the bloodhounds, sir, and the murderer’s knife,” urged the inspector.

“Tut, tut, man!” exclaimed Thorndyke; “those bloodhounds are a positive obsession. But I see a sergeant coming up the drive, with the knife, I hope. Perhaps that will solve the riddle for us.”

The sergeant, who carried a small dispatch-box, halted opposite the tree in some surprise while we descended, when he came forward with a military salute and handed the box to the inspector, who forthwith unlocked it, and, opening the lid, displayed an object wrapped in a pocket-handkerchief.
“There is the knife, sir,” said he, “just as I received it. The handkerchief is the sergeant’s.”

Thorndyke unrolled the handkerchief and took from it a large-sized Norwegian knife, which he looked at critically and then handed to me. While I was inspecting the blade, he shook out the handkerchief and, having looked it over on both sides, turned to the sergeant.

“At what time did you pick up this knife?” he asked.

“About seven-fifteen, sir; directly after the hounds had started. I was careful to pick it up by the ring, and I wrapped it in the handkerchief at once.”

“Seven-fifteen,” said Thorndyke. “Less than half-an-hour after the murder. That is very singular. Do you observe the state of this handkerchief? There is not a mark on it. Not a trace of any bloodstain; which proves that when the knife was picked up, the blood on it was already dry. But things dry slowly, if they dry at all, in the saturated air of an autumn evening. The appearances seem to suggest that the blood on the knife was dry when it was thrown down. By the way, sergeant, what do you scent your handkerchief with?”

“Scent, sir!” exclaimed the astonished officer in indignant accents; “me scent my handkerchief! No, sir, certainly not. Never used scent in my life, sir.”

Thorndyke held out the handkerchief, and the sergeant sniffed at it incredulously. “It certainly does seem to smell of scent,” he admitted, “but it must be the knife.” The same idea having occurred to me, I applied the handle of the knife to my nose and instantly detected the sickly-sweet odour of musk.

“The question is,” said the inspector, when the two articles had been tested by us all, “was it the knife that scented the Handkerchief or the handkerchief that scented the knife?”

“You heard what the sergeant said,” replied Thorndyke. “There was no scent on the handkerchief when the knife was wrapped in it. Do you know, inspector, this scent seems to me to offer a very curious suggestion. Consider the facts of the case: the distinct trail leading straight to Ellis, who is, nevertheless, found to be without a scratch or a spot of blood; the inconsistencies in the case that I pointed out in the train, and now this knife, apparently dropped with dried blood on it and scented with musk. To me it suggests a carefully-planned, coolly-premeditated crime. The murderer knew about the general’s bloodhounds and made use of them as a blind. He planted this knife, smeared with blood and tainted with musk, to furnish a scent. No doubt some object, also scented with musk, would be drawn over the ground to give the trail. It is only a suggestion, of course, but it is worth considering.”

“But, sir,” the inspector objected eagerly, “if the murderer had handled the knife, it would have scented him too.”

“Exactly; so, as we are assuming that the man is not a fool, we may assume that he did not handle it. He will have left it here in readiness, hidden in some place whence he could knock it down, say, with a stick, without touching it.”

“Perhaps in this very tree, sir,” suggested the sergeant, pointing to the oak.

“No,” said Thorndyke, “he would hardly have hidden in the tree where the knife had been. The hounds might have scented the place instead of following the trail at once. The most likely hiding-place for the knife is the one nearest the spot where it was found.” He walked over to the stone that marked the spot, and looking round, continued: “You see, that hornbeam is much the nearest, and its flat crown would be very convenient for the purpose—easily reached even by a short man, as he appears to be. Let us see if there are any traces of it. Perhaps you will give me a ‘back up’, sergeant, as we haven’t a ladder.”

The sergeant assented with a faint grin, and stooping beside the tree in an attitude suggesting the game of leapfrog, placed his hands firmly on his knees. Grasping a stout branch, Thorndyke swung himself up on the sergeant’s broad back, whence he looked down into the crown of the tree. Then, parting the branches, he stepped onto the ledge and disappeared into the central hollow.

When he reappeared he held in his hands two very singular objects: a pair of iron crucible-tongs and an artist’s brush-case of black-japanned tin. The former article he handed down to me, but the brush-case he held carefully by its wire handle as he dropped to the ground.

“The significance of these things is, I think, obvious,” he said. “The tongs were used to handle the knife with and the case to carry it in, so that it should not scent his clothes or bag. It was very carefully planned.”

“If that is so,” said the inspector, “the inside of the case ought to smell of musk.”

“No doubt,” said Thorndyke; “but before we open it, there is a rather important matter to be attended to. Will you give me the Vitogen powder, Jervis?”

I opened the canvas-covered “research case” and took from it an object like a diminutive pepper-caster—an iodo-form dredger in fact—and handed it to him. Grasping the brush-case by its wire handle, he sprinkled the pale yellow powder from the dredger freely all round the pull-off lid, tapping the top with his knuckles to make the fine particles spread. Then he blew off the superfluous powder, and the two police officers gave a simultaneous gasp of joy; for now, on the black background, there stood out plainly a number of finger-prints, so clear and distinct that the ridge-pattern could be made out with perfect ease.

“These will probably be his right hand,” said Thorndyke. “Now for the left.” He treated the body of the case in the same
way, and, when he had blown off the powder, the entire surface was spotted with yellow, oval impressions. “Now, Jervis,” said he, “if you will put on a glove and pull off the lid, we can test the inside.”

There was no difficulty in getting the lid off, for the shoulder of the case had been smeared with vaseline—apparently to produce an airtight joint—and, as it separated with a hollow sound, a faint, musky odour exhaled from its interior.

“The remainder of the inquiry,” said Thorndyke, when I pushed the lid on again, “will be best conducted at the police station, where, also, we can photograph these fingerprints.”

“The shortest way will be across the meadows,” said Fox; “the way the hounds went.”

By this route we accordingly travelled, Thorndyke carrying the brush-case tenderly by its handle.

“I don’t quite see where Ellis comes in in this job,” said the inspector, as we walked along, “if the fellow had a grudge against Pratt. They weren’t chums.”

“I think I do,” said Thorndyke. “You say that both men were prison officers at Portland at the same time. Now doesn’t it seem likely that this is the work of some old convict who had been identified—and perhaps blackmailed—by Pratt, and possibly by Ellis too? That is where the value of the finger-prints comes in. If he is an old ‘lag’ his prints will be at Scotland Yard. Otherwise they are not of much value as a clue.”

“That’s true, sir,” said the inspector. “I suppose you want to see Ellis.”

“I want to see that purse that you spoke of, first,” replied Thorndyke. “That is probably the other end of the clue.”

As soon as we arrived at the station, the inspector unlocked a safe and brought out a parcel. “These are Ellis’s things,” said he, as he unfastened it, “and that is the purse.”

He handed Thorndyke a small pigskin pouch, which my colleague opened, and having smelt the inside, passed to me. The odour of musk was plainly perceptible, especially in the small compartment at the back.

“It has probably tainted the other contents of the parcel,” said Thorndyke, sniffing at each article in turn, “but my sense of smell is not keen enough to detect any scent. They all seem odourless to me, whereas the purse smells quite distinctly. Shall we have Ellis in now?”

The sergeant took a key from a locked drawer and departed for the cells, whence he presently re-appeared accompanied by the prisoner—a stout, burly man, in the last stage of dejection.

“Come, cheer up, Ellis,” said the inspector. “Here’s Dr. Thorndyke come down to help us and he wants to ask you one or two questions.”

Ellis looked piteously at Thorndyke, and exclaimed: “I know nothing whatever about this affair, sir, I swear to God I don’t.”

“I never supposed you did,” said Thorndyke. “But there are one or two things that I want you to tell me. To begin with, that purse: where did you find it?”

“No, sir; a hedge on a low bank.”

“Ha! Well, now, tell me: is there any one about here whom you knew when you and Pratt were together at Portland? Any old lag—to put it bluntly—whom you and Pratt have been putting the screw on.”

“Ha! Well, now, tell me: is there any one about here whom you knew when you and Pratt were together at Portland? Any old lag—to put it bluntly—whom you and Pratt have been putting the screw on.”

“No, sir, I swear there isn’t. But I wouldn’t answer for Pratt. He had a rare memory for faces.”

Thorndyke reflected. “Were there any escapes from Portland in your time?” he asked.

“Only one—a man named Dobbs. He made off to the sea in a sudden fog and he was supposed to be drowned. His clothes washed up on the Bill, but not his body. At any rate, he was never heard of again.”

“Thank you, Ellis. Do you mind my taking your fingerprints?”

“Certainly not, sir,” was the almost eager reply; and the office inking-pad being requisitioned, a rough set of finger-prints was produced; and when Thorndyke had compared them with those on the brush-case and found no resemblance, Ellis returned to his cell in quite buoyant spirits.

Having made several photographs of the strange fingerprints, we returned to town that evening, taking the negatives with us; and while we waited for our train, Thorndyke gave a few parting injunctions to the inspector. “Remember,” he said, “that the man must have washed his hands before he could appear in public. Search the banks of every pond, ditch and stream in the neighbourhood for footprints like those in the avenue; and, if you find any, search the bottom of the water thoroughly, for he is quite likely to have dropped the knife into the mud.”

The photographs, which we handed in at Scotland Yard that same night, enabled the experts to identify the fingerprints
as those of Francis Dobbs, an escaped convict. The two photographs—profile and full-face—which were attached to his record, were sent down to Baysford with a description of the man, and were, in due course, identified with a somewhat mysterious individual, who passed by the name of Rufus Pembury and who had lived in the neighbourhood as a private gentleman for some two years. But Rufus Pembury was not to be found either at his genteel house or elsewhere. All that was known was, that on the day after the murder, he had converted his entire “personalty” into “bearer securities,” and then vanished from mortal ken. Nor has he ever been heard of to this day.

“And, between ourselves,” said Thorndyke, when we were discussing the case some time after, “he deserved to escape. It was clearly a case of blackmail, and to kill a blackmailer—when you have no other defence against him—is hardly murder. As to Ellis, he could never have been convicted, and Dobbs, or Pembury, must have known it. But he would have been committed to the Assizes, and that would have given time for all traces to disappear. No, Dobbs was a man of courage, ingenuity and resource; and, above all, he knocked the bottom out of the great bloodhound superstition.”
III. — THE ECHO OF A MUTINY

PART L. — DEATH ON THE GIRDLER

POPULAR belief ascribes to infants and the lower animals certain occult powers of divining character denied to the reasoning faculties of the human adult; and is apt to accept their judgment as finally overriding the pronouncements of mere experience.

Whether this belief rests upon any foundation other than the universal love of paradox it is unnecessary to inquire. It is very generally entertained, especially by ladies of a certain social status; and by Mrs. Thomas Solly it was loyally maintained as an article of faith.

"Yes," she moralized, "it's surprisin' how they know, the little children and the dumb animals. But they do. There's no deceivin' them. They can tell the gold from the dross in a moment, they can, and they reads the human heart like a book. Wonderful, I call it. I suppose it's instinct."

Having delivered herself of this priceless gem of philosophic thought, she thrust her arms elbow-deep into the foaming wash-tub and glanced admiringly at her lodger as he sat in the doorway, supporting on one knee an obese infant of eighteen months and on the other a fine tabby cat.

James Brown was an elderly seafaring man, small and slight in build and in manner suave, insinuating and perhaps a trifle sly. But he had all the sailor's love of children and animals, and the sailor's knack of making himself acceptable to them, for, as he sat with an empty pipe wobbling in the grasp of his toothless gums, the baby beamed with humid smiles, and the cat, rolled into a fluffy ball and purring like a stocking-loom, worked its fingers ecstatically as if it were trying on a new pair of gloves.

"It must be mortal lonely out at the lighthouse," Mrs. Solly resumed, "Only three men and never a neighbour to speak to; and, Lord! what a muddle they must be in with no woman to look after them and keep 'em tidy. But you won't be overworked, Mr. Brown, in these long days; daylight till past nine o'clock. I don't know what you'll do to pass the time."

"Oh, I shall find plenty to do, I expect," said Brown, "what with cleanin' the lamps and glasses and paintin' up the ironwork. And that reminds me," he added, looking round at the clock, "that time's getting on. High water at half-past ten, and here it's gone eight o'clock."

Mrs. Solly, acting on the hint, began rapidly to fish out the washed garments and wring them out into the form of short ropes. Then, having dried her hands on her apron, she relieved Brown of the protesting baby.

"Your room will be ready for you, Mr. Brown," said she, "when your turn comes for a spell ashore; and main glad me and Tom will be to see you back."

"Thank you, Mrs. Solly, ma'am," answered Brown, tenderly placing the cat on the floor; "you won't be more glad than what I will." He shook hands warmly with his landlady, kissed the baby, chuckled the cat under the chin, and, picking up his little chest by its becket, swung it onto his shoulder and strode out of the cottage.

His way lay across the marshes, and, like the ships in the offing, he shaped his course by the twin towers of Reculver that stood up grotesquely on the rim of the land; and as he trod the springy turf, Tom Solly's fleecy charges looked up at him with vacant stares and valedictory bleatings. Once, at a dyke-gate, he paused to look back at the fair Kentish landscape: at the grey tower of St. Nicholas-at-Wade peeping above the trees and the faraway mill at Sarre, whirling slowly in the summer breeze; and, above all, at the solitary cottage where, for a brief spell in his stormy life, he had known the homely joys of domesticity and peace. Well, that was over for the present, and the lighthouse loomed ahead. With a half-sigh he passed through the gate and walked on towards Reculver.

Outside the whitewashed cottages with their official black chimney-pots a petty-officer of the coast-guard was adjusting the halyards of the flagstaff. He looked round as Brown approached, and hailed him cheerily.

"Here you are, then," said he, "all figged out in your new togs, too. But we're in a bit of a difficulty, d'ye see. We've got to pull up to Whitstable this morning, so I can't send a man out with you and I can't spare a boat."

"Have I got to swim out, then?" asked Brown.

The coast-guard grinned. "Not in them new clothes, mate," he answered. "No, but there's old Willett's boat; he isn't using her to-day; he's going over to Minster to see his daughter, and he'll let us have the loan of the boat. But there's no one to go with you, and I'm responsible to Willett."

"Well, what about it?" asked Brown, with the deep-sea sailor's (usually misplaced) confidence in his power to handle a sailing-boat. "D'ye think I can't manage a tub of a boat? Me what's used the sea since I was a kid of ten?"

"Yes," said the coast-guard; "but who's to bring her back?"

"Why, the man that I'm going to relieve," answered Brown. "He don't want to swim no more than what I do."

The coast-guard reflected with his telescope pointed at a passing barge. "Well, I suppose it'll be all right," he concluded; "but it's a pity they couldn't send the tender round. However, if you undertake to send the boat back, we'll get her afloat. It's time you were off."
He strolled away to the back of the cottages, whence he presently returned with two of his mates, and the four men proceeded along the shore to where Willett’s boat lay just above high-water mark.

The Emily was a beamy craft of the type locally known as a “half-share skiff,” solidly built of oak, with varnished planking and fitted with main and mizen hogs. She was a good handful for four men, and, as she slid over the soft chalk rocks with a hollow rumble, the coast-guards debated the advisability of lifting out the bags of shingle with which she was ballasted. However, she was at length dragged down, ballast and all, to the water’s edge, and then, while Brown stepped the mainmast, the petty-officer gave him his directions. “What you’ve got to do,” said he, “is to make use of the flood-tide. Keep her nose nor’east, and with this trickle of nor’westerly breeze you ought to make the light-house in one board. Anyhow don’t let her get east of the lighthouse, or, when the ebb sets in, you’ll be in a fix.”

To these admonitions Brown listened with jaunty indifference as he hoisted the sails and watched the incoming tide creep over the level shore. Then the boat lifted on the gentle swell. Putting out an oar, he gave a vigorous shove off that sent the boat, with a final scrape, clear of the beach, and then, having dropped the rudder onto its pintles, he seated himself and calmly belayed the main-sheet.

“There he goes,” growled the coast-guard; “makin’ fast his sheet. They will do it” (he invariably did it himself), “and that’s how accidents happen. I hope old Willett’ll see his boat back all right.”

He stood for some time watching the dwindling boat as it sidled across the smooth water; then he turned and followed his mates towards the station.

Out on the south-western edge of the Girdler Sand, just inside the two-fathom line, the spindle-shanked lighthouse stood a-straddle on its long screw-piles like some uncouth red-bodied wading bird. It was now nearly half flood tide. The highest shoals were long since covered, and the lighthouse rose above the smooth sea as solitary as a slaver becalmed in the “middle passage.”

On the gallery outside the lantern were two men, the entire staff of the building, of whom one sat huddled in a chair with his left leg propped up with pillows on another, while his companion rested a telescope on the rail and peered at the faint grey line of the distant land and the two tiny points that marked the twin spires of Reculver.

“I don’t see any signs of the boat, Harry,” said he.

The other man groaned. “I shall lose the tide,” he complained, “and then there’s another day gone.”

“They can pull you down to Birchington and put you in the train,” said the first man.

“I don’t want no trains,” growled the invalid. “The boat’ll be bad enough. I suppose there’s nothing coming our way, Tom?”

Tom turned his face eastward and shaded his eyes. “There’s a brig coming across the tide from the north,” he said. “Looks like a collier.” He pointed his telescope at the approaching vessel, and added: “She’s got two new cloths in her upper fore top-sail, one on each leech.”

The other man sat up eagerly. “What’s her trysail like, Tom?” he asked.

“Can’t see it,” replied Tom. “Yes, I can, now: it’s tanned. Why, that’ll be the old Utopia, Harry; she’s the only brig I know that’s got a tanned trysail.”

“Look here, Tom,” exclaimed the other, “If that’s the Utopia, she’s going to my home and I’m going aboard of her. Captain Mockett’ll give me a passage, I know.”

“You oughtn’t to go until you’re relieved, you know, Barnett,” said Tom doubtfully; “it’s against regulations to leave your station.”

“Regulations be blown!” exclaimed Barnett. “My leg’s more to me than the regulations. I don’t want to be a cripple all my life. Besides, I’m no good here, and this new chap, Brown, will be coming out presently. You run up the signal, Tom, like a good comrade, and hail the brig.”

“Well, it’s your look-out,” said Tom, “and I don’t mind saying that if I was in your place I should cut off home and see a doctor, if I got the chance.” He sauntered off to the flag-locker, and, selecting the two code-flags, deliberately toggled them onto the halyards. Then, as the brig swept up within range, he hoisted the little balls of bunting to the flagstaff-head and jerked the halyards, when the two flags blew out making the signal “Need assistance.”

Promptly a coal-soiled answering pennant soared to the brig’s main-truck; less promptly the collier went about, and, turning her nose down stream, slowly drifted stern-forwards towards the lighthouse. Then a boat slid out through her gangway, and a couple of men ploed the oars vigorously.

“Lighthouse ahoy!” roared one of them, as the boat came within hail. “What’s amiss?”

“Harry Barnett has broke his leg,” shouted the lighthouse keeper, “and he wants to know if Captain Mockett will give him a passage to Whitstable.”

The boat turned back to the brig, and after a brief and bellowed consultation, once more pulled towards the lighthouse.

“Skipper says yus,” roared the sailor, when he was within ear-shot, “and he says look alive, ‘cause he don’t want to miss his tide.”
The injured man heaved a sigh of relief. “That’s good news,” said he, “though, how the blazes I’m going to get down the ladder is more than I can tell. What do you say, Jeffreys?”

“I say you’d better let me lower you with the tackle,” replied Jeffreys. “You can sit in the bight of a rope and I’ll give you a line to steady yourself with.”

“Ah, that’ll do, Tom,” said Barnett; “but, for the Lord’s sake, pay out the fall-rope gently.”

The arrangements were made so quickly that by the time the boat was fast alongside everything was in readiness, and a minute later the injured man, dangling like a gigantic spider from the end of the tackle, slowly descended, cursing volubly to the accompaniment of the creaking of the blocks. His chest and kit-bag followed, and, as soon as these were unhooked from the tackle, the boat pulled off to the brig, which was now slowly creeping stern-foremost past the lighthouse. The sick man was hoisted up the side, his chest handed up after him, and then the brig was put on her course due south across the Kentish Flats.

Jeffreys stood on the gallery watching the receding vessel and listening to the voices of her crew as they grew small and weak in the increasing distance. Now that his gruff companion was gone, a strange loneliness had fallen on the lighthouse. The last of the homeward-bound ships had long since passed up the Princes Channel and left the calm sea desolate and blank. The distant buoys, showing as tiny black dots on the glassy surface, and the spindly shapes of the beacons which stood up from invisible shoals, but emphasized the solitude of the empty sea, and the tolling of the bell buoy on the Shivering Sand, stealing faintly down the wind, sounded weird and mournful. The day’s work was already done. The lenses were polished, the lamps had been trimmed, and the little motor that worked the foghorn had been cleaned and oiled. There were several odd jobs, it is true, waiting to be done, as there always are in a lighthouse; but, just now, Jeffreys was not in a working humour. A new comrade was coming into his life to-day, a stranger with whom he was to be shut up alone, night and day, for a month on end, and whose temper and tastes and habits might mean for him pleasant companionship or jangling and discord without end. Who was this man Brown? What had he been? and what was he like? These were the questions that passed, naturally enough, through the lighthouse keeper’s mind and distracted him from his usual thoughts and occupations.

Presently a speck on the landward horizon caught his eye. He snatched up the telescope eagerly to inspect it. Yes, it was a boat; but not the coast-guard’s cutter, for which he was looking. Evidently a fisherman’s boat and with only one man in it. He laid down the telescope with a sigh of disappointment, and, filling his pipe, leaned on the rail with a dreamy eye bent on the faint grey line of the land.

Three long years had he spent in this dreary solitude, so repugnant to his active, restless nature: three blank, interminable years, with nothing to look back on but the endless succession of summer calms, stormy nights and the chilly fogs of winter, when the unseen steamers hooted from the void and the fog-horn bellowed its hoarse warning.

Why had he come to this God-forsaken spot? and why did he stay, when the wide world called to him? And then memory painted him a picture on which his mind’s eye had often looked before and which once again arose before him, shutting out the vision of the calm sea and the distant land. It was a brightly-coloured picture. It showed a cloudless sky brooding over the deep blue tropic sea: and in the middle of the picture, see-sawing gently on the quiet swell, a white-painted barque.

Her sails were clewed up untidily, her swinging yards jerked at the slack braces and her untended wheel revolved to and fro to the oscillations of the rudder.

She was not a derelict, for more than a dozen men were on her deck; but the men were all drunk and mostly asleep, and there was never an officer among them.

Then he saw the interior of one of her cabins. The chart-rack, the tell-tale compass and the chronometers marked it as the captain’s cabin. In it were four men, and two of them lay dead on the deck. Of the other two, one was a small, cunning-faced man, who was, at the moment, kneeling beside one of the corpses to wipe a knife upon its coat. The fourth man was himself.

Again, he saw the two murderers stealing off in a quarter-boat, as the barque with her drunken crew drifted towards the spouting surf of a river-bar. He saw the ship melt away in the surf like an icicle in the sunshine; and, later, two shipwrecked mariners, picked up in an open boat and set ashore at an American port.

That was why he was here. Because he was a murderer. The other scoundrel, Amos Todd, had turned Queen’s Evidence and denounced him, and he had barely managed to escape. Since then he had hidden himself from the great world, and here he must continue to hide, not from the law—for his person was unknown now that his shipmates were dead—but from the partner of his crime. It was the fear of Todd that had changed him from Jeffrey Rorke to Tom Jeffreys and had sent him to the Girdler, a prisoner for life. Todd might die—might even now be dead—but he would never hear of it: would never hear the news of his release.

He roused himself and once more pointed his telescope at the distant boat. She was considerably nearer now and seemed to be heading out towards the lighthouse. Perhaps the man in her was bringing a message; at any rate, there was no sign of the coast-guard’s cutter.

He went in, and, betaking himself to the kitchen, busied himself with a few simple preparations for dinner. But there was nothing to cook, for there remained the cold meat from yesterday’s cooking, which he would make sufficient, with some biscuit in place of potatoes. He felt restless and unstrung; the solitude irked him, and the everlasting wash of the water
among the piles jarred on his nerves.

When he went out again into the gallery the ebb-tide had set in strongly and the boat was little more than a mile distant; and now, through the glass, he could see that the man in her wore the uniform cap of the Trinity House. Then the man must be his future comrade, Brown; but this was very extraordinary. What were they to do with the boat? There was no one to take her back.

The breeze was dying away. As he watched the boat, he saw the man lower the sail and take to his oars; and something of hurry in the way the man pulled over the gathering tide, caused Jeffreys to look round the horizon. And then, for the first time, he noticed a bank of fog creeping up from the east and already so near that the beacon on the East Girdler had faded out of sight. He hastened in to start the little motor that compressed the air for the fog-horn and waited awhile to see that the mechanism was running properly. Then, as the deck vibrated to the roar of the horn, he went out once more into the gallery.

The fog was now all round the lighthouse and the boat was hidden from view. He listened intently. The enclosing wall of vapour seemed to have shut out sound as well as vision. At intervals the horn bellowed its note of warning, and then all was still save the murmur of the water among the piles below, and, infinitely faint and far away, the mournful tolling of the bell on the Shivering Sand.

At length there came to his ear the muffled sound of oars working in the holes; then, at the very edge of the circle of grey water that was visible, the boat appeared through the fog, pale and spectral, with a shadowy figure pulling furiously. The horn emitted a hoarse growl; the man looked round, perceived the lighthouse and altered his course towards it.

Jeffreys descended the iron stairway, and, walking along the lower gallery, stood at the head of the ladder earnestly watching the approaching stranger. Already he was tired of being alone. The yearning for human companionship had been growing ever since Barnett left. But what sort of comrade was this stranger who was coming into his life? And coming to occupy so dominant a place in it.

The boat swept down swiftly athwart the hurrying tide. Nearer it came and yet nearer: and still Jeffreys could catch no glimpse of his new comrade’s face. At length it came fairly alongside and bumped against the fender-posts; the stranger whisked in an oar and grabbed a rung of the ladder, and Jeffreys dropped a coil of rope into the boat. And still the man’s face was hidden.

Jeffreys leaned out over the ladder and watched him anxiously, as he made fast the rope, unhooked the sail from the traveller and unstepped the mast. When he had set all in order, the stranger picked up a small chest, and, swinging it over his shoulder, stepped onto the ladder. Slowly, by reason of his encumbrance, he mounted, rung by rung, with never an upward glance, and Jeffreys gazed down at the top of his head with growing curiosity. At last he reached the top of the ladder and Jeffreys stooped to lend him a hand. Then, for the first time, he looked up, and Jeffreys started back with a blanched face.

“God Almighty!” he gasped. “It’s Amos Todd!”

As the newcomer stepped on the gallery, the fog-horn emitted a roar like that of some hungry monster. Jeffreys turned abruptly without a word, and walked to the stairs, followed by Todd, and the two men ascended with never a sound but the hollow clank of their footsteps on the iron plates. Silently Jeffreys stalked into the living-room and, as his companion followed, he turned and motioned to the latter to set down his chest.

“You ain’t much of a talker, mate,” said Todd, looking round the room in some surprise; “ain’t you going to say ‘good-morning’? We’re going to be good comrades, I hope. I’m Jim Brown, the new hand, I am; what might your name be?”

Jeffreys turned on him suddenly and led him to the window. “Look at me carefully, Amos Todd,” he said sternly, “and then ask yourself what my name is.”

At the sound of his voice Todd looked up with a start and turned pale as death. “It can’t be,” he whispered, “it can’t be Jeff Rorke!”

The other man laughed harshly, and leaning forward, said in a low voice: “Hast thou found me, O mine enemy!”

“Don’t say that!” exclaimed Todd. “Don’t call me your enemy, Jeff. Lord knows but I’m glad to see you, though I’d never have known you without your beard and with that grey hair. I’ve been to blame, Jeff, and I know it; but it ain’t no use raking up old grudges. Let bygones be bygones, Jeff, and let us be pals as we used to be.” He wiped his face with his handkerchief and watched his companion apprehensively.

“Sit down,” said Rorke, pointing to a shabby rep-covered arm-chair; “sit down and tell me what you’ve done with all that money. You’ve blued it all, I suppose, or you wouldn’t be here.”

“Robbed, Jeff,” answered Todd; “robbed of every penny. Ah! that was an unfortunate affair, that job on board the old Sea-flower. But it’s over and done with and we’d best forget it. They’re all dead but us, Jeff, so we’re safe enough so long as we keep our mouths shut; all at the bottom of the sea—and the best place for ‘em too.”

“Yes,” Rorke replied fiercely, “that’s the best place for your shipmates when they know too much; at the bottom of the sea or swinging at the end of a rope.” He paced up and down the little room with rapid strides, and each time that he approached Todd’s chair the latter shrank back with an expression of alarm.
“Don’t sit there staring at me,” said Rorke. “Why don’t you smoke or do something?”

Todd hastily produced a pipe from his pocket, and having filled it from a moleskin pouch, stuck it in his mouth while he searched for a match. Apparently he carried his matches loose in his pocket, for he presently brought one forth—a red-headed match, which, when he struck it on the wall, lighted with a pale-blue flame. He applied it to his pipe, sucking in his cheeks while he kept his eyes fixed on his companion. Rorke, meanwhile, halted in his walk to cut some shavings from a cake of hard tobacco with a large clasp-knife; and, as he stood, he gazed with frowning abstraction at Todd.

“This pipe’s stopped,” said the latter, sucking ineffectually at the mouthpiece. “Have you got such a thing as a piece of wire, Jeff?”

“No, I haven’t,” replied Rorke; “not up here. I’ll get a bit from the store presently. Here, take this pipe till you can clean your own: I’ve got another in the rack there.” The sailor’s natural hospitality overcoming for the moment his animosity, he thrust the pipe that he had just filled towards Todd, who took it with a mumbled “Thank you” and an anxious eye on the open knife. On the wall beside the chair was a roughly-carved pipe-rack containing: several pipes, one of which Rorke lifted out; and, as he leaned over the chair to reach it, Todd’s face went several shades paler.

“Well, Jeff,” he said, after a pause, while Rorke cut a fresh “fill” of tobacco, “are we going to be pals same as what we used to be?”

Rorke’s animosity lighted up afresh. “Am I going to be pals with the man that tried to swear away my life?” he said sternly; and after a pause he added: “That wants thinking about, that does; and meantime I must go and look at the engine.”

When Rorke had gone the new hand sat, with the two pipes in his hands, reflecting deeply. Abstractedly he stuck the fresh pipe into his mouth, and, dropping the stopped one into the rack, felt for a match. Still with an air of abstraction he lit the pipe, and having smoked for a minute or two, rose from the chair and began softly to creep across the room, looking about him and listening intently. At the door he paused to look out into the fog, and then, having again listened attentively, he stepped on tip-toe out onto the gallery and along towards the stairway. Of a sudden the voice of Rorke brought him up with a start.

“Hallo, Todl! where are you off to?”

“I’m just going down to make the boat secure,” was the reply.

“Never you mind about the boat,” said Rorke. “I’ll see to her.”

“Right-o, Jeff,” said Todd, still edging towards the stairway. “But, I say, mate, where’s the other man—the man that I’m to relieve?”

“There ain’t any other man,” replied Rorke; “he went off aboard a collier.”

Todd’s face suddenly became grey and haggard. “Then there’s no one here but us two!” he gasped; and then, with an effort to conceal his fear, he asked: “But who’s going to take the boat back?”

“We’ll see about that presently,” replied Rorke; “you get along in and unpack your chest.”

He came out on the gallery as he spoke, with a lowering frown on his face. Todd cast a terrified glance at him, and then turned and ran for his life towards the stairway.

“Come back!” roared Rorke, springing forward along the gallery; but Todd’s feet were already clattering down the iron steps. By the time Rorke reached the head of the stairs, the fugitive was near the bottom; but here, in his haste, he stumbled, barely saving himself by the handrail, and when he recovered his balance Rorke was upon him. Todd darted to the head of the ladder, but, as he grasped the stanchion, his pursuer seized him by the collar. In a moment he had turned with his hand under his coat. There was a quick blow, a loud curse from Rorke, an answering yell from Todd, and a knife fell spinning through the air and dropped into the fore-peak of the boat below.

“You murderous little devil!” said Rorke in an ominously quiet voice, with his bleeding hand gripping his captive by the throat. “Handy with your knife as ever, eh? So you were off to give information, were you?”

“No, I wasn’t Jeff,” replied Todd in a choking voice; “I wasn’t, s’elp me, God. Let go, Jeff. I didn’t mean no harm. I was only—” With a sudden wrench he freed one hand and struck out frantically at his captor’s face. But Rorke warded off the blow, and, grasping the other wrist, gave a violent push and let go. Todd staggered backward a few paces along the staging, bringing up at the extreme edge; and here, for a sensible time, he stood with wide-open mouth and starting eye-balls, swaying and clutching wildly at the air. Then, with a shrill scream, he toppled backwards and fell, striking a pile in his descent and rebounding into the water.

In spite of the audible thump of his head on the pile, he was not stunned, for when he rose to the surface, he struck out vigorously, uttering short, stifled cries for help. Rorke watched him with set teeth and quickened breath, but made no move. Smaller and still smaller grew the head with its little circle of ripples, swept away on the swift ebb-tide, and fainter the bubbling cries that came across the smooth water. At length as the small black spot began to fade in the fog, the drowning man, with a final effort, raised his head clear of the surface and sent a last, despairing shriek towards the lighthouse. The fog-horn sent back an answering bellow; the head sank below the surface and was seen no more; and in the dreadful stillness that settled down upon the sea there sounded faint and far away the muffled tolling of a bell.
Rorke stood for some minutes immovable, wrapped in thought. Presently the distant hoot of a steamer’s whistle aroused him. The ebb-tide shipping was beginning to come down and the fog might lift at any moment; and there was the boat still alongside. She must be disposed of at once. No one had seen her arrive and no one must see her made fast to the lighthouse. Once get rid of the boat and all traces of Todd’s visit would be destroyed. He ran down the ladder and stepped into the boat. It was simple. She was heavily ballasted, and would go down if she filled.

He shifted some of the bags of shingle, and, lifting the bottom boards, pulled out the plug. Instantly a large jet of water spouted up into the bottom. Rorke looked at it critically, and, deciding that it would fill her in a few minutes, replaced the bottom boards; and having secured the mast and sail with a few turns of the sheet round a thwart, to prevent them from floating away, he cast off the mooring-rope and stepped on the ladder.

As the released boat began to move away on the tide, he ran up and mounted to the upper gallery to watch her disappearance. Suddenly he remembered Todd’s chest. It was still in the room below. With a hurried glance around into the fog, he ran down to the room, and snatching up the chest, carried it on the lower gallery. After another nervous glance around to assure himself that no craft was in sight, he heaved the chest over the handrail, and, when it fell with a loud splash into the sea, he waited to watch it float away after its owner and the sunken boat. But it never rose; and presently he returned to the upper gallery.

The fog was thinning perceptibly now, and the boat remained plainly visible as she drifted away. But she sank more slowly than he had expected, and presently as she drifted farther away, he fetched the telescope and peered at her with growing anxiety. It would be unfortunate if any one saw her; if she should be picked up here, with her plug out, it would be disastrous.

He was beginning to be really alarmed. Through the glass he could see that the boat was now rolling in a sluggish, water-logged fashion, but she still showed some inches of free-board, and the fog was thinning every moment.

Presently the blast of a steamer’s whistle sounded close at hand. He looked round hurriedly and, seeing nothing, again pointed the telescope eagerly at the dwindling boat. Suddenly he gave a gasp of relief. The boat had rolled gunwale under; had staggered back for a moment and then rolled again, slowly, finally, with the water pouring in over the submerged gunwale.

In a few more seconds she had vanished. Rorke lowered the telescope and took a deep breath. Now he was safe. The boat had sunk unseen. But he was better than safe: he was free. His evil spirit, the standing menace of his life, was gone, and the wide world, the world of life, of action, of pleasure, called to him.

In a few minutes the fog lifted. The sun shone brightly on the red-funnelled cattle-boat whose whistle had startled him just now, the summer blue came back to sky and sea, and the land peeped once more over the edge of the horizon.

He went in, whistling cheerfully, and stopped the motor; returned to coil away the rope that he had thrown to Todd; and, when he had hoisted a signal for assistance, he went in once more to eat his solitary meal in peace and gladness.

PART II — “THE SINGING BONE”

(RELATED BY CHRISTOPHER JERVIS, M.D.)

IN every kind of scientific work a certain amount of manual labour naturally appertains, labour that cannot be performed by the scientist himself, since art is long but life is short. A chemical analysis involves a laborious “clean up” of apparatus and laboratory, for which the chemist has no time; the preparation of a skeleton—the maceration, bleaching, “assembling,” and riveting together of bones—must be carried out by someone whose time is not too precious. And so with other scientific activities. Behind the man of science with his outfit of knowledge is the indispensable mechanic with his outfit of manual skill.

Thorndyke’s laboratory assistant, Polton, was a fine example of the latter type, deft, resourceful, ingenious and untiring. He was somewhat of an inventive genius, too; and it was one of his inventions that connected us with the singular case that I am about to record.

Though by trade a watchmaker, Polton was, by choice, an optician. Optical apparatus was the passion of his life; and when, one day, he produced for our inspection an improved prism for increasing the efficiency of gas-buoys, Thorndyke at once brought the invention to the notice of a friend at the Trinity House.

As a consequence, we three—Thorndyke, Polton and I—found ourselves early on a fine July morning making our way down Middle Temple Lane bound for the Temple Pier. A small oil-launch lay alongside the pontoon, and, as we made our appearance, a red-faced, white-whiskered gentleman stood up in the cockpit.

“Here’s a delightful morning, doctor,” he sang out in a fine, brassy, resonant, sea-faring voice; “sort of day for a trip to the lower river, hey? Hallo, Polton! Coming down to take the bread out of our mouths, are you? Ha, ha!” The cheery laugh rang out over the river and mingled with the throb of the engine as the launch moved off from the pier.

Captain Grumpass was one of the Elder Brethren of the Trinity House. Formerly a client of Thorndyke’s he had subsided, as Thorndyke’s clients were apt to do, into the position of a personal friend, and his hearty regard included our invaluable assistant.

“Nice state of things,” continued the captain, with a chuckle, “when a body of nautical experts have got to be taught their
business by a parcel of lawyers or doctors, what? I suppose trade’s slack and ‘Satan findeth mischief still,’ hey, Polton?”

“There isn’t much doing on the civil side, sir,” replied Polton, with a quaint, crinkly smile, “but the criminals are still going strong.”

“Ha! mystery department still flourishing, what? And, by Jove! talking of mysteries, doctor, our people have got a queer problem to work out; something quite in your line—quite. Yes, and, by the Lord Moses, since I’ve got you here, why shouldn’t I suck your brains?”

“Exactly,” said Thorndyke. “Why shouldn’t you?”

“Well, then, I will,” said the captain, “so here goes. All hands to the pump!” He lit a cigar, and, after a few preliminary puffs, began: “The mystery, shortly stated, is this: one of our lighthousemen has disappeared—vanished off the face of the earth and left no trace. He may have bolted, he may have been drowned accidentally or he may have been murdered. But I’d rather give you the particulars in order. At the end of last week a barge brought into Ramsgate a letter from the screw-pile lighthouse on the Girdler. There are only two men there, and it seems that one of them, a man named Barnett, had broken his leg, and he asked that the tender should be sent to bring him ashore. Well, it happened that the local tender, the Warden, was up on the slip in Ramsgate Harbour, having a scrape down, and wouldn’t be available for a day or two, so, as the case was urgent, the officer at Ramsgate sent a letter to the lighthouse by one of the pleasure steamers saying that the man should be relieved by boat on the following morning, which was Saturday. He also wrote to a new hand who had just been taken on, a man named James Brown, who was lodging near Reculver, waiting his turn, telling him to go out on Saturday morning in the coast-guard’s boat; and he sent a third letter to the coast-guard at Reculver asking him to take Brown out to the lighthouse and bring Barnett ashore. Well, between them, they made a fine muddle of it. The coast-guard couldn’t spare either a boat or a man, so they borrowed a fisherman’s boat, and in this the man Brown started off alone, like an idiot, on the chance that Barnett would be able to sail the boat back in spite of his broken leg.

“Meanwhile Barnett, who is a Whitstable man, had signalled a collier bound for his native town, and got taken off; so that the other keeper, Thomas Jeffreys, was left alone until Brown should turn up.

“But Brown never did turn up. The coast-guard helped him to put off and saw him well out to sea, and the keeper, Jeffreys, saw a sailing-boat with one man in her making for the lighthouse. Then a bank of fog came up and hid the boat, and when the fog cleared she was nowhere to be seen. Man and boat had vanished and left no sign.”

“He may have been run down,” Thorndyke suggested.

“He may,” agreed the captain, “but no accident has been reported. The coast-guards think he may have capsized in a squall—they saw him make the sheet fast. But there weren’t any squalls; the weather was quite calm.”

“Was he all right and well when he put off?” inquired Thorndyke.

“Yes,” replied the captain, “the coast-guards’ report is highly circumstantial; in fact, it’s full of silly details that have no bearing on anything. This is what they say.” He pulled out an official letter and read: “When last seen, the missing man was seated in the boat’s stern to windward of the helm. He had belayed the sheet. He was holding a pipe and tobacco-pouch in his hands and steering with his elbow. He was filling the pipe from the tobacco-pouch. There! He was holding the pipe in his hand, mark you! not with his toes; and he was filling it from a tobacco-pouch, whereas you’d have expected him to fill it from a coalscuttle or a feeding-bottle. Bah!” The captain rammed the letter back in his pocket and puffed scornfully at his cigar.

“You are hardly fair to the coast-guard,” said Thorndyke, laughing at the captain’s vehemence. “The duty of a witness is to give all the facts, not a judicious selection.”

“But, my dear sir,” said Captain Grumpass, “what the deuce can it matter what the poor devil filled his pipe from?”

“Who can say?” answered Thorndyke. “It may turn out to be a highly material fact. One never knows beforehand. The value of a particular fact depends on its relation to the rest of the evidence.”

“I suppose it does,” grunted the captain; and he continued to smoke in reflective silence until we opened Black-wall Point, when he suddenly stood up.

“There’s a steam trawler alongside our wharf,” he announced. “Now what the deuce can she be doing there?” He scanned the little steamer attentively, and continued:

“They seem to be landing something, too. Just pass me those glasses, Polton. Why, hang me! it’s a dead body! But why on earth are they landing it on our wharf? They must have known you were coming, doctor.”

As the launch swept alongside the wharf, the captain sprang up lightly and approached the group gathered round the body. “What’s this?” he asked. “Why have they brought this thing here?”

The master of the trawler, who had superintended the landing, proceeded to explain.

“It’s one of your men, sir,” said he. “We saw the body lying on the edge of the South Shingles Sand, close to the beacon, as we passed at low water, so we put off the boat and fetched it aboard. As there was nothing to identify the man by, I had a look in his pockets and found this letter.”

He handed the captain an official envelope addressed to: “Mr. J. Brown, co Mr. Solly, Shepherd, Reculver, Kent.”
"Why, this is the man we were speaking about, doctor," exclaimed Captain Grumpass. "What a very singular coincidence. But what are we to do with the body?"

"You will have to write to the coroner," replied Thorndyke. "By the way, did you turn out all the pockets?" he asked, turning to the skipper of the trawler.

"No, sir," was the reply. "I found the letter in the first pocket that I felt in, so I didn’t examine any of the others. Is there anything more that you want to know, sir?"

"Nothing but your name and address, for the coroner," replied Thorndyke, and the skipper, having given this information and expressed the hope that the coroner would not keep him “hanging about,” returned to his vessel and pursued his way to Billingsgate.

"I wonder if you would mind having a look at the body of this poor devil, while Polton is showing us his contraptions," said Captain Grumpass.

"I can’t do much without a coroner’s order," replied Thorndyke; “but if it will give you any satisfaction, Jervis and I will make a preliminary inspection with pleasure.”

"I should be glad if you would," said the captain. "We should like to know that the poor beggar met his end fairly."

The body was accordingly moved to a shed, and, as Polton was led away, carrying the black bag that contained his precious model, we entered the shed and commenced our investigation.

The deceased was a small, elderly man, decently dressed in a somewhat nautical fashion. He appeared to have been dead only two or three days, and the body, unlike the majority of sea-borne corpses, was uninjured by fish or crabs. There were no fractured bones or other gross injuries, and no wounds, excepting a rugged tear in the scalp at the back of the head.

"The general appearance of the body," said Thorndyke, when he had noted these particulars, “suggests death by drowning, though, of course, we can’t give a definite opinion until a post mortem has been made.”

"You don’t attach any significance to that scalp-wound, then?" I asked.

"As a cause of death? No. It was obviously inflicted during life, but it seems to have been an oblique blow that spent its force on the scalp, leaving the skull uninjured. But it is very significant in another way."

"In what way?" I asked.

Thorndyke took out his pocket-case and extracted a pair of forceps. "Consider the circumstances," said he. "This man put off from the shore to go to the lighthouse, but never arrived there. The question is, where did he arrive?" As he spoke he stooped over the corpse and turned back the hair round the wound with the beak of the forceps. "Look at those white objects among the hair, Jervis, and inside the wound. They tell us something, I think."

I examined, through my lens, the chalky fragments to which he pointed. “These seem to be bits of shells and the tubes of some marine worm,” I said.

"Yes," he answered; "the broken shells are evidently those of the acorn barnacle, and the other fragments are mostly pieces of the tubes of the common serpula. The inference that these objects suggest is an important one. It is that this wound was produced by some body encrusted by acorn barnacles and serpulae; that is to say, by a body that is periodically submerged. Now, what can that body be, and how can the deceased have knocked his head against it?"

"It might be the stem of a ship that ran him down," I suggested.

"I don’t think you would find many serpulae on the stem of a ship," said Thorndyke. "The combination rather suggests some stationary object between tidemarks, such as a beacon. But one doesn’t see how a man could knock his head against a beacon, while, on the other hand, there are no other stationary objects out in the estuary to knock against except buoys, and a buoy presents a flat surface that could hardly have produced this wound. By the way, we may as well see what there is in his pockets, though it is not likely that robbery had anything to do with his death."

"No," I agreed, "and I see his watch is in his pocket; quite a good silver one," I added, taking it out. "It has stopped at 12.13."

"That may be important," said Thorndyke, making a note of the fact; "but we had better examine the pockets one at a time, and put the things back when we have looked at them."

The first pocket that we turned out was the left hip-pocket of the monkey jacket. This was apparently the one that the skipper had rifled, for we found in it two letters, both bearing the crest of the Trinity House. These, of course, we returned without reading, and then passed on to the right pocket. The contents of this were common-place enough, consisting of a briar pipe, a moleskin pouch and a number of loose matches.

"Rather a casual proceeding, this," I remarked, "to carry matches loose in the pocket, and a pipe with them, too."

"Yes," agreed Thorndyke; "especially with these very inflammable matches. You notice that the sticks had been coated at the upper end with sulphur before the red phosphorous heads were put on. They would light with a touch, and would be very difficult to extinguish; which, no doubt, is the reason that this type of match is so popular among seamen, who have to light their pipes in all sorts of weather." As he spoke he picked up the pipe and looked at it reflectively, turning it over in his hand and peering into the bowl. Suddenly he glanced from the pipe to the dead man’s face and then, with the forceps,
turned back the lips to look into the mouth.

“Let us see what tobacco he smokes,” said he.

I opened the sodden pouch and displayed a mass of dark, fine-cut tobacco. “It looks like shag,” I said.

“Yes, it is shag,” he replied; “and now we will see what is in the pipe. It has been only half-smoked out.” He dug out the “dottle” with his pocket-knife onto a sheet of paper, and we both inspected it. Clearly it was not shag, for it consisted of coarsely-cut shreds and was nearly black.

“Shavings from a cake of ‘hard,’” was my verdict, and Thorndyke agreed as he shot the fragments back into the pipe.

The other pockets yielded nothing of interest, except a pocket-knife, which Thorndyke opened and examined closely. There was not much money, though as much as one would expect, and enough to exclude the idea of robbery.

“Is there a sheath-knife on that strap?” Thorndyke asked, pointing to a narrow leather belt. I turned back the jacket and looked.

“There is a sheath,” I said, “but no knife. It must have dropped out.”

“That is rather odd,” said Thorndyke. “A sailor’s sheath-knife takes a deal of shaking out as a rule. It is intended to be used in working on the rigging when the man is aloft, so that he can get it out with one hand while he is holding on with the other. It has to be and usually is very secure, for the sheath holds half the handle as well as the blade. What makes one notice the matter in this case is that the man, as you see, carried a pocket-knife; and, as this would serve all the ordinary purposes of a knife, it seems to suggest that the sheath-knife was carried for defensive purposes: as a weapon, in fact. However, we can’t get much further in the case without a post mortem, and here comes the captain.”

Captain Grumpass entered the shed and looked down commiseratingly at the dead seaman.

“Is there anything, doctor, that throws any light on the man’s disappearance?” he asked.

“There are one or two curious features in the case,” Thorndyke replied; “but, oddly enough, the only really important point arises out of that statement of the coastguard’s, concerning which you were so scornful.”

“You don’t say so!” exclaimed the captain.

“Yes,” said Thorndyke; “the coast-guard states that when last seen deceased was filling his pipe from his tobacco-pouch. Now his pouch contains shag: but the pipe in his pocket contains hard cut.”

“Is there no cake tobacco in any of the pockets?”

“Not a fragment. Of course, it is possible that he might have had a piece and used it up to fill the pipe; but there is no trace of any on the blade of his pocket-knife, and you know how this juicy black cake stains a knife-blade. His sheath-knife is missing, but he would hardly have used that to shred tobacco when he had a pocket-knife.”

“No,” assented the captain; “but are you sure he hadn’t a second pipe?”

“There was only one pipe,” replied Thorndyke, “and that was not his own.”

“Not his own!” exclaimed the captain, halting by a huge, chequered buoy, to stare at my colleague. “How do you know it was not his own?”

“By the appearance of the vulcanite mouthpiece,” said Thorndyke. “It showed deep tooth-marks; in fact, it was nearly bitten through. Now a man who bites through his pipe usually presents certain definite physical peculiarities, among which is, necessarily, a fairly good set of teeth. But the dead man had not a tooth in his head.”

The captain cogitated a while, and then remarked: “I don’t quite see the bearing of this.”

“Don’t you?” said Thorndyke. “It seems to me highly suggestive. Here is a man who, when last seen, was filling his pipe with a particular kind of tobacco. He is picked up dead, and his pipe contains a totally different kind of tobacco. Where did that tobacco come from? The obvious suggestion is that he had met someone.”

“Yes, it does look like it,” agreed the captain.

“Then,” continued Thorndyke, “there is the fact that his sheath-knife is missing. That may mean nothing, but we have to bear it in mind. And there is another curious circumstance: there is a wound on the back of the head caused by a heavy bump against some body that was covered with acorn barnacles and marine worms. Now there are no piers or stages out in the open estuary. The question is, what could he have struck?”

“Oh, there is nothing in that,” said the captain. “When a body has been washing about in a tide-way for close on three days—”

“But this is not a question of a body,” Thorndyke interrupted. “The wound was made during life.”

“The deuce it was!” exclaimed the captain. “Well, all I can suggest is that he must have fouled one of the beacons in the fog, stote in his boat and bumped his head, though, I must admit, that’s rather a lame explanation.” He stood for a minute gazing at his toes with a cogitative frown and then looked up at Thorndyke.

“I have an idea,” he said. “From what you say, this matter wants looking into pretty carefully. Now, I am going down on the tender to-day to make inquiries on the spot. What do you say to coming with me as adviser—as a matter of business, of
course—you and Dr. Jervis? I shall start about eleven; we shall be at the lighthouse by three o’clock, and you can get back to town to-night, if you want to. What do you say?"

“There’s nothing to hinder us,” I put in eagerly, for even at Bugsby’s Hole the river looked very alluring on this summer morning.

“Very well,” said Thorndyke, “we will come. Jervis is evidently hankering for a sea-trip, and so am I, for that matter.”

“It’s a business engagement, you know,” the captain stipulated.

“Nothing of the kind,” said Thorndyke; “it’s unmitigated pleasure; the pleasure of the voyage and your high well-born society.”

“I didn’t mean that,” grumbled the captain, “but, if you are coming as guests, send your man for your nightgear and let us bring you back to-morrow evening.”

“We won’t disturb Polton,” said my colleague; “we can take the train from Blackwall and fetch our things ourselves. Eleven o’clock, you said?”

“Thereabouts,” said Captain Grumpass; “but don’t put yourselves out.”

The means of communication in London have reached an almost undesirable state of perfection. With the aid of the snorting train, the tinkling, two-wheeled “gondola,” we crossed and re-crossed the town with such celerity that it was barely eleven when we re-appeared on Trinity Wharf with a joint Gladstone and Thorndyke’s little green case. The tender had hauled out of Bow Creek, and now lay alongside the wharf with a great striped can buoy dangling from her derrick, and Captain Grumpass stood at the gangway, his jolly, red face beaming with pleasure. The buoy was safely stowed forward, the derrick hauled up to the mast, the loose shrouds rehooked to the screw-lanyards, and the steamer, with four jubilant hoots, swung round and shoved her sharp nose against the incoming tide.

For near upon four hours the ever-widening stream of the “London River” unfolded its moving panorama. The smoke and smell of Woolwich Reach gave place to lucid air made soft by the summer haze; the grey huddle of factories fell away and green levels of cattle-spotted marsh stretched away to the high land bordering the river valley. Venerable training ships displayed their chequered hulls by the wooded shore, and whispered of the days of oak and hemp, when the tall three-decker, comely and majestic, with her soaring heights of canvas, like towers of ivory, had not yet given place to the mud-coloured saucepans that fly the white ensign now-a-days and devour the British taxpayer: when a sailor was a sailor and not a mere seafaring mechanic. Sturdily breathing the flood tide, the tender threaded her way through the endless procession of shipping; barges, billy-boys, schooners, brigs; lumpish Black-seamen, blue-funnelled China tramps, rickety Baltic barques with twirling windmills, gigantic liners, staggering under a mountain of top-hamper. Erith, Purfleet, Greenhithe, Grays greeted us and passed astern. The chimneys of Northfleet, the clustering roofs of Gravesend, the populous anchorage and the lurking batteries, were left behind, and, as we swung out of the Lower Hope, the wide expanse of sea reach spread out before us like a great sheet of blue-shot satin.

About half-past twelve the ebb overtook us and helped us on our way, as we could see by the speed with which the distant land slid past, and the freshening of the air as we passed through it.

But sky and sea were hushed in a summer calm. Balls of fleecy cloud hung aloft, motionless in the soft blue; the barges drifted on the tide with drooping sails, and a big, striped bell buoy—surrounded by a staff and cage and labelled, “Shivering Sand”—sat dreaming in the sun above its motionless reflection, to rouse for a moment as it met our wash, nod its cage drowsily, utter a solemn ding-dong, and fall asleep again.

It was shortly after passing the buoy that the gaunt shape of a screw-pile lighthouse began to loom up ahead, its dull-red paint turned to vermilion by the early afternoon sun. As we drew nearer, the name Girdler, painted in huge, white letters, became visible, and two men could be seen in the gallery around the lantern, inspecting us through a telescope.

“Shall you be long at the lighthouse, sir?” the master of the tender inquired of Captain Grumpass; “because we’re going down, to the North-East Pan Silt to fix this new buoy and take up the old one.”

“Then you’d better put us off at the lighthouse and come back for us when you’ve finished the job,” was the reply. “I don’t know how long we shall be.”

The tender was brought to, a boat lowered, and a couple of hands pulled us across the intervening space of water.

“It will be a dirty climb for you in your shore-going clothes,” the captain remarked—he was as spruce as a new pin himself, “but the stuff will all wipe off.” We looked up at the skeleton shape. The falling tide had exposed some fifteen feet of the piles, and piles and ladder alike were swathed in sea-grass and encrusted with barnacles and worm-tubes. But we were not such town-sparrows as the captain seemed to think, for we both followed his lead without difficulty up the slippery ladder, Thorndyke clinging tenaciously to his little green case, from which he refused to be separated even for an instant.

“These gentlemen and I,” said the captain, as we stepped on the stage at the head of the ladder, “have come to make inquiries about the missing man, James Brown. Which of you is Jeffreys?”

“I am, sir,” replied a tall, powerful, square-jawed, beetle-browed man, whose left hand was tied up in a rough bandage.
“What have you been doing to your hand?” asked the captain.

“I cut it while I was peeling some potatoes,” was the reply. “It isn’t much of a cut, sir.”

“Well, Jeffreys,” said the captain, “Brown’s body has been picked up and I want particulars for the inquest. You’ll be summoned as a witness, I suppose, so come in and tell us all you know.”

We entered the living-room and seated ourselves at the table. The captain opened a massive pocket-book, while Thorndyke, in his attentive, inquisitive fashion, looked about the odd, cabin-like room as if making a mental inventory of its contents.

Jeffreys’ statement added nothing to what we already knew. He had seen a boat with one man in it making for the lighthouse. Then the fog had drifted up and he had lost sight of the boat. He started the fog-horn and kept a bright lookout, but the boat never arrived. And that was all he knew. He supposed that the man must have missed the lighthouse and been carried away on the ebb-tide, which was running strongly at the time.

“What time was it when you last saw the boat?” Thorndyke asked.

“About half-past eleven,” replied Jeffreys.

“What was the man like?” asked the captain.

“I don’t know, sir; he was rowing, and his back was towards me.”

“Had he any kit-bag or chest with him?” asked Thorndyke.

“He’d got his chest with him,” said Jeffreys.

“What sort of chest was it?” inquired Thorndyke.

“A small chest, painted green, with rope becets.”

“Was it corded?”

“It had a single cord round, to hold the lid down.”

“Where was it stowed?”

“In the stern-sheets, sir.”

“How far off was the boat when you last saw it?”

“About half-a-mile.”

“Half-a-mile!” exclaimed the captain. “Why, how the deuce could you see that chest half-a-mile away?”

The man reddened and cast a look of angry suspicion at Thorndyke. “I was watching the boat through the glass, sir,” he replied sulkily.

“I see,” said Captain Grumpass. “Well, that will do, Jeffreys. We shall have to arrange for you to attend the inquest. Tell Smith I want to see him.”

The examination concluded, Thorndyke and I moved our chairs to the window, which looked out over the sea to the east. But it was not the sea or the passing ships that engaged my colleague’s attention. On the wall, beside the window, hung a rudely-carved pipe-rack containing five pipes. Thorndyke had noted it when we entered the room, and now, as we talked, I observed him regarding it from time to time with speculative interest.

“You men seem to be inveterate smokers,” he remarked to the keeper, Smith, when the captain had concluded the arrangements for the “shift.”

“Well, we do like our bit of ‘baccy, sir, and that’s a fact,” answered Smith. “You see, sir,” he continued, “it’s a lonely life, and tobacco’s cheap out here.”

“How is that?” asked Thorndyke.

“Why, we get it given to us. The small craft from foreign, especially the Dutchmen, generally heave us a cake or two when they pass close. We’re not ashore, you see, so there’s no duty to pay.”

“So you don’t trouble the tobacconists much? Don’t go in for cut tobacco?”

“No, sir; we’d have to buy it, and then the cut stuff wouldn’t keep. No, it’s hard-tack to eat out here and hard tobacco to smoke.”

“I see you’ve got a pipe-rack, too, quite a stylish affair.”

“Yes,” said Smith, “I made it in my off-time. Keeps the place tidy and looks more ship-shape than letting the pipes lay about anywhere.”

“Someone seems to have neglected his pipe,” said Thorndyke, pointing to one at the end of the rack which was coated with green mildew.

“Yes; that’s Parsons, my mate. He must have left it when he went off near a month ago. Pipes do go mouldy in the damp
air out here."

"How soon does a pipe go mouldy if it is left untouched?" Thorndyke asked.

"It's according to the weather," said Smith. "When it's warm and damp they'll begin to go in about a week. Now here's Barnett's pipe that he's left behind—the man that broke his leg, you know, sir—it's just beginning to spot a little. He couldn't have used it for a day or two before he went."

"And are all these other pipes yours?"

"No, sir. This here one is mine. The end one is Jeffreys', and I suppose the middle one is his too, but I don't know it."

"You're a demon for pipes, doctor," said the captain, strolling up at this moment; "you seem to make a special study of them."

"The proper study of mankind is man," replied Thorndyke, as the keeper retired, "and 'man' includes those objects on which his personality is impressed. Now a pipe is a very personal thing. Look at that row in the rack. Each has its own physiognomy which, in a measure, reflects the peculiarities of the owner. There is Jeffreys' pipe at the end, for instance. The mouth-piece is nearly bitten through, the bowl scraped to a shell and scored inside and the brim battered and chipped. The whole thing speaks of rude strength and rough handling. He chews the stem as he smokes, he scrapes the bowl violently, and he bangs the ashes out with unnecessary force. And the man fits the pipe exactly: powerful, square-jawed and, I should say, violent on occasion."

"Yes, he looks a tough customer, does Jeffreys," agreed the captain.

"Then," continued Thorndyke, "there is Smith's pipe, next to it; 'coked' up until the cavity is nearly filled and burnt all round the edge; a talker's pipe, constantly going out and being relit. But the one that interests me most is the middle one."

"Didn't Smith say that was Jeffreys' too?" I said.

"Yes," replied Thorndyke, "but he must be mistaken. It is the very opposite of Jeffreys' pipe in every respect. To begin with, although it is an old pipe, there is not a sign of any tooth-mark on the mouth-piece. It is the only one in the rack that is quite unmarked. Then the brim is quite uninjured: it has been handled gently, and the silver band is jet-black, whereas the band on Jeffreys' pipe is quite bright."

"I hadn't noticed that it had a band," said the captain. "What has made it so black?"

Thorndyke lifted the pipe out of the rack and looked at it closely. "Silver sulphide," said he, "the sulphur no doubt derived from something carried in the pocket."

"I see," said Captain Grumpass, smothering a yawn and gazing out of the window at the distant tender. "Incidentally it's full of tobacco. What moral do you draw from that?"

Thorndyke turned the pipe over and looked closely at the mouth-piece. "The moral is," he replied, "that you should see that your pipe is clear before you fill it." He pointed to the mouth-piece, the bore of which was completely stopped up with fine fluff.

"An excellent moral too," said the captain, rising with another yawn. "If you'll excuse me a minute I'll just go and see what the tender is up to. She seems to be crossing to the East Girdler." He reached the telescope down from its brackets and went out onto the gallery.

As the captain retreated, Thorndyke opened his pocket-knife, and, sticking the blade into the bowl of the pipe, turned the tobacco out into his hand.

"Shag, by Jove!" I exclaimed.

"Yes," he answered, poking it back into the bowl. "Didn't you expect it to be shag?"

"I don't know that I expected anything," I admitted. "The silver band was occupying my attention."

"Yes, that is an interesting point," said Thorndyke, "but let us see what the obstruction consists of." He opened the green case, and, taking out a dissecting needle, neatly extracted a little ball of fluff from the bore of the pipe. Laying this on a glass slide, he teased it out in a drop of glycerine and put on a cover-glass while I set up the microscope.

"Better put the pipe back in the rack," he said, as he laid the slide on the stage of the instrument. I did so and then turned, with no little excitement, to watch him as he examined the specimen. After a brief inspection he rose and waved his hand towards the microscope.

"Take a look at it, Jervis," he said.

I applied my eye to the instrument, and, moving the slide about, identified the constituents of the little mass of fluff. The ubiquitous cotton fibre was, of course, in evidence, and a few fibres of wool, but the most remarkable objects were two or three hairs—very minute hairs of a definite zigzag shape and having a flat expansion near the free end like the blade of a paddle.

"These are the hairs of some small animal," I said; "not a mouse or rat or any rodent, I should say. Some small insectivorous animal, I fancy. Yes! Of course! They are the hairs of a mole." I stood up, and, as the importance of the discovery flashed on me, I looked at my colleague in silence.
“Yes,” he said, “they are unmistakable; and they furnish the keystone of the argument.”

“You think that this is really the dead man’s pipe, then?” I said.

“According to the law of multiple evidence,” he replied, “it is practically a certainty. Consider the facts in sequence. Since there is no sign of mildew on it, this pipe can have been here only a short time, and must belong either to Barnett, Smith, Jeffreys or Brown. It is an old pipe, but it has no tooth-marks on it. Therefore it has been used by a man who has no teeth. But Barnett, Smith and Jeffreys all have teeth and mark their pipes, whereas Brown has no teeth. The tobacco in it is shag. But these three men do not smoke shag, whereas Brown had shag in his pouch. The silver band is encrusted with sulphide; and Brown carried sulphur-tipped matches loose in his pocket with his pipe. We find hairs of a mole in the bore of the pipe; and Brown carried a moleskin pouch in the pocket in which it appears to have carried his pipe. Finally, Brown’s pocket contained a pipe which was obviously not his and which closely resembled that of Jeffreys; it contained tobacco similar to that which Jeffreys smokes and different from that in Brown’s pouch. It appears to me quite conclusive, especially when we add to this evidence the other items that are in our possession.”

“What items are they?” I asked.

“First there is the fact that the dead man had knocked his head heavily against some periodically submerged body covered with acorn barnacles and serpulae. Now the piles of this lighthouse answer to the description exactly, and there are no other bodies in the neighbourhood that do: for even the beacons are too large to have produced that kind of wound. Then the dead man’s sheath-knife is missing, and Jeffreys has a knife-wound on his hand. You must admit that the circumstantial evidence is overwhelming.”

At this moment the captain bustled into the room with the telescope in his hand. “The tender is coming up towing a strange boat,” he said. “I expect it’s the missing one, and, if it is, we may learn something. You’d better pack up your traps and get ready to go on board.”

We packed the green case and went out into the gallery, where the two keepers were watching the approaching tender; Smith frankly curious and interested, Jeffreys restless, fidgety and noticeably pale. As the steamer came opposite the lighthouse, three men dropped into the boat and pulled across, and one of them—the mate of the tender—came climbing up the ladder.

“Is that the missing boat?” the captain sang out.

“Yes, sir,” answered the officer, stepping onto the staging and wiping his hands on the reverse aspect of his trousers, “we saw her lying on the dry patch of the East Girdler. There’s been some hanky-panky in this job, sir.”

“Foul play, you think, hey?”

“Not a doubt of it, sir. The plug was out and lying loose in the bottom, and we found a sheath-knife sticking into the kelson forward among the coils of the painter. It was stuck in hard as if it had dropped from a height.”

“That’s odd,” said the captain. “As to the plug, it might have got out by accident.”

“But it hadn’t sir,” said the mate. “The ballast-bags had been shifted along to get the bottom boards up. Besides, sir, a seaman wouldn’t let the boat fill; he’d have put the plug back and baled out.”

“That’s true,” replied Captain Grumpass; “and certainly the presence of the knife looks fishy. But where the deuce could it have dropped from, out in the open sea? Knives don’t drop from the clouds—fortunately. What do you say, doctor?”

“I should say that it is Brown’s own knife, and that it probably fell from this staging.”

Jeffreys turned swiftly, crimson with wrath. “What d’ye mean?” he demanded. “Haven’t I said that the boat never came here?”

“You have,” replied Thorndyke; “but if that is so, how do you explain the fact that your pipe was found in the dead man’s pocket and that the dead man’s pipe is at this moment in your pipe-rack?”

The crimson flush on Jeffreys’ face faded as quickly as it had come. “I don’t know what you’re talking about,” he faltered.

“I’ll tell you,” said Thorndyke. “I will relate what happened and you shall check my statements. Brown brought his boat alongside and came up into the living-room, bringing his chest with him. He filled his pipe and tried to light it, but it was stopped and wouldn’t draw. Then you lent him a pipe of yours and filled it for him. Soon afterwards you came out on this staging and quarrelled. Brown defended himself with his knife, which dropped from his hand into the boat. You pushed him off the staging and he fell, knocking his head on one of the piles. Then you took the plug out of the boat and sent her adrift to sink, and you flung the chest into the sea. This happened about ten minutes past twelve. Am I right?”

Jeffreys stood staring at Thorndyke, the picture of amazement and consternation; but he uttered no word in reply. “Am I right?” Thorndyke repeated.

“Strike me blind!” muttered Jeffreys. “Was you here, then? You talk as if you had been. Anyhow, he continued, recovering somewhat, you seem to know all about it. But you’re wrong about one thing. There was no quarrel. This chap, Brown, didn’t take to me and he didn’t mean to stay out here. He was going to put off and go ashore again and I wouldn’t let him. Then he hit out at me with his knife and I knocked it out of his hand and he staggered backwards and went overboard.”
“And did you try to pick him up?” asked the captain.

“How could I,” demanded Jeffreys, “with the tide racing down and me alone on the station? I’d never have got back.”

“But what about the boat, Jeffreys? Why did you scuttle her?”

“The fact is,” replied Jeffreys, “I got in a funk, and I thought the simplest plan was to send her to the cellar and know nothing about it. But I never shoved him over. It was an accident, sir; I swear it!”

“Well, that sounds a reasonable explanation,” said the captain. “What do you say, doctor?”

“Perfectly reasonable,” replied Thorndyke, “and, as to its truth, that is no affair of ours.”

“No. But I shall have to take you off, Jeffreys, and hand you over to the police. You understand that?”

“Yes, sir, I understand,” answered Jeffreys.

“That was a queer case, that affair on the Girdler,” remarked Captain Grumpass, when he was spending an evening with us some six months later. “A pretty easy let off for Jeffreys, too—eighteen months, wasn’t it?”

“Yes, it was a very queer case indeed,” said Thorndyke. “There was something behind that ‘accident,’ I should say. Those men had probably met before.”

“So I thought,” agreed the captain. “But the queerest part of it to me was the way you nosed it all out. I’ve had a deep respect for briar pipes since then. It was a remarkable case,” he continued. “The way in which you made that pipe tell the story of the murder seems to me like sheer enchantment.”

“Yes,” said I, “it spoke like the magic pipe—only that wasn’t a tobacco-pipe—in the German folk-story of the ‘Singing Bone.’ Do you remember it? A peasant found the bone of a murdered man and fashioned it into a pipe. But when he tried to play on it, it burst into a song of its own—

“My brother slew me and buried my bones
Beneath the sand and under the stones.”

“A pretty story,” said Thorndyke, “and one with an excellent moral. The inanimate things around us have each of them a song to sing to us if we are but ready with attentive ears.”

IV. — A WASTREL’S ROMANCE

PART I. — THE SPINSTERS’ GUEST

THE lingering summer twilight was fast merging into night as a solitary cyclist, whose evening-dress suit was thinly disguised by an overcoat, rode slowly along a pleasant country road. From time to time he had been overtaken and passed by a carriage, a car or a closed cab from the adjacent town, and from the festive garb of the occupants he had made shrewd guesses at their destination. His own objective was a large house, standing in somewhat extensive grounds just off the road, and the peculiar circumstances that surrounded his visit to it caused him to ride more and more slowly as he approached his goal.

Willowdale—such was the name of the house—was, tonight, witnessing a temporary revival of its past glories. For many months it had been empty and a notice-board by the gate-keeper’s lodge had silently announced its forlorn state; but tonight, its rooms, their bare walls clothed in flags and draperies, their floors waxed or carpeted, would once more echo the sound of music and cheerful voices and vibrate to the tread of many feet. For on this night the spinsters of Raynesford were giving a dance; and chief amongst the spinsters was Miss Halliwell, the owner of Willowdale.

It was a great occasion. The house was large and imposing; the spinsters were many and their purses were long. The guests were numerous and distinguished, and included no less a person than Mrs. Jehu B. Chater. This was the crowning triumph of the function, for the beautiful American widow was the lion (or should we say lioness?) of the season. Her wealth was, if not beyond the dreams of avarice, at least beyond the powers of common British arithmetic, and her diamonds were, at once, the glory and the terror of her hostesses.

All these attractions notwithstanding, the cyclist approached the vicinity of Willowdale with a slowness almost hinting at reluctance; and when, at length, a curve of the road brought the gates into view, he dismounted and halted irresolutely. He was about to do a rather risky thing, and, though by no means a man of weak nerve, he hesitated to make the plunge.

The fact is, he had not been invited.

Why, then, was he going? And how was he to gain admittance? To which questions the answer involves a painful explanation.

Augustus Bailey lived by his wits. That is the common phrase, and a stupid phrase it is. For do we not all live by our wits, if we have any? And does it need any specially brilliant wits to be a common rogue? However, such as his wits were, Augustus Bailey lived by them, and he had not hitherto made a fortune.

The present venture arose out of a conversation overheard at a restaurant table and an invitation-card carelessly laid
down and adroitly covered with the menu. Augustus had accepted the invitation that he had not received (on a sheet of Hotel Cecil notepaper that he had among his collection of stationery) in the name of Geoffrey Harrington-Baillie; and the question that exercised his mind at the moment was, would he or would he not be spotted? He had trusted to the number of guests and the probable inexperience of the hostesses. He knew that the cards need not be shown, though there was the awkward ceremony of announcement.

But perhaps it wouldn't get as far as that. Probably not, if his acceptance had been detected as emanating from an uninvited stranger.

He walked slowly towards the gates with growing discomfort. Added to his nervousness as to the present were certain twinges of reminiscence. He had once held a commission in a line regiment—not for long, indeed; his "wits" had been too much for his brother officers—but there had been a time when he would have come to such a gathering as this an invited guest. Now, a common thief, he was sneaking in under a false name, with a fair prospect of being ignominiously thrown out by the servants.

As he stood hesitating, the sound of hoofs on the road was followed by the aggressive bellow of a motor-horn. The modest twinkle of carriage lamps appeared round the curve and then the glare of acetylene headlamps. A man came out of the lodge and drew open the gates; and Mr. Bailey, taking his courage in both hands, boldly trundled his machine up the drive.

Half-way up—it was quite a steep incline—the car whizzed by; a large Napier filled with a bevy of young men who economized space by sitting on the backs of the seats and on one another's knees. Bailey looked at them and decided that this was his chance, and, pushing forward, he saw his bicycle safely bestowed in the empty coach-house and then hurried on to the cloak-room. The young men had arrived there before him and, as he entered, were gaily peeling off their overcoats and flinging them down on a table. Bailey followed their example, and, in his eagerness to enter the reception-room with the crowd, let his attention wander from the business of the moment, and, as he pocketed the ticket and hurried away, he failed to notice that the bewildered attendant had put his hat with another man's coat and affixed his duplicate to them both.

"Major Podbury, Captain Barker-Jones, Captain Sparker, Mr. Watson, Mr. Goldsmith, Mr. Smart, Mr. Harrington-Baillie!"

As Augustus swaggered up the room, hugging the party of officers and quaking inwardly, he was conscious that his hostesses glanced from one man to another with more than common interest.

But at that moment the footman's voice rang out, sonorous and clear—

"Mrs. Chater, Colonel Grumpier!" and, as all eyes were turned towards the new arrivals, Augustus made his bow and passed into the throng. His little game of bluff had "come off," after all.

He withdrew modestly into the more crowded portion of the room, and there took up a position where he would be shielded from the gaze of his hostesses. Presently, he reflected, they would forget him, if they had really thought about him at all, and then he would see what could be done in the way of business. He was still rather shaky, and wondered how soon it would be decent to steady his nerves with a "refresher." Meanwhile he kept a sharp look-out over the shoulders of neighbouring guests, until a movement in the crowd of guests disclosed Mrs. Chater shaking hands with the presiding spinster. Then Augustus got a most uncommon surprise.

He knew her at the first glance. He had a good memory for faces, and Mrs. Chater's face was one to remember. Well did he recall the frank and lovely American girl with whom he had danced at the regimental ball years ago. That was in the old days when he was a subaltern, and before that little affair of the pricked court-cards that brought his military career to an end. They had taken a mutual liking, he remembered, that sweet-faced Yankee maid and he had danced many dances and had sat out others, to talk mystical nonsense which, in their innocence, they had believed to be philosophy. He had never seen her since. She had come into his life and gone out of it again, and he had forgotten her name, if he had ever known it. But here she was, middle-aged now, it was true, but still beautiful and a great personage withal. And, ye gods! what diamonds! And here was he, too, a common rogue, lurking in the crowd that he might, perchance, snatch a pendant or "pinch" a loose brooch.

Perhaps she might recognize him. Why not? He had recognized her. But that would never do. And thus reflecting, Mr. Bailey slipped out to stroll on the lawn and smoke a cigarette. Another man, somewhat older than himself, was pacing to and fro thoughtfully, glancing from time to time through the open windows into the brilliantly-lighted rooms. When they had passed once or twice, the stranger halted and addressed him.

"This is the best place on a night like this," he remarked; "it's getting hot inside already. But perhaps you're keen on dancing."

"Not so keen as I used to be," replied Bailey; and then, observing the hungry look that the other man was bestowing on his cigarette, he produced his case and offered it.

"Thanks awfully!" exclaimed the stranger, pouncing with avidity on the open case. "Good Samaritan, by Jove. Left my case in my overcoat. Hadn't the cheek to ask, though I was starving for a smoke." He inhaled luxuriously, and, blowing out a cloud of smoke, resumed: "These chits seem to be running the show pretty well, h'm? Wouldn't take it for an empty house to look at it, would you?"
“I have hardly seen it,” said Bailey; “only just come, you know.”

“Well, I have a look round, if you like,” said the genial stranger, “when we’ve finished our smoke, that is. Have a drink too; may cool us a bit. Know many people here?”

“Not a soul,” replied Bailey. “My, hostess doesn’t seem to have turned up.”

“Well, that’s easily remedied,” said the stranger. “My daughter’s one of the spinsters—Granby, my name; when we’ve had a drink, I’ll make her find you a partner—that is, if you care for the light fantastic.”

“I should like a dance or two,” said Bailey, “though I’m getting a bit past it now, I suppose. Still, it doesn’t do to chuck up the sponge prematurely.”

“Certainly not,” Granby agreed jovially; “a man’s as young as he feels. Well, come and have a drink and then we’ll hunt up my little girl.” The two men flung away the stumps of their cigarettes and headed for the refreshments.

The spinsters’ champagne was light, but it was well enough if taken in sufficient quantity; a point to which Augustus? and Granby too—paid judicious attention; and when he had supplemented the wine with a few sandwiches, Mr. Bailey felt in notably better spirits. For, to tell the truth, his diet, of late, had been somewhat meagre. Miss Granby, when found, proved to be a blonde and guileless “flapper” of some seventeen summers, childishly eager to play her part of hostess with due dignity; and presently Bailey found himself gyrating through the eddying crowd in company with a comely matron of thirty or thereabouts.

The sensations that this novel experience aroused rather took him by surprise. For years past he had been living a precarious life of mean and sordid shifts that oscillated between mere shabby trickery and downright crime; now conducting a paltry swindle just inside the pale of the law, and now, when hard pressed, descending to actual theft; consorting with shady characters, swindlers and knives and scurrv rogues like himself; gambling, borrowing, cadging and, if need be, stealing, and always slinking abroad with an apprehensive eye upon “the man in blue.”

And now, amidst the half-forgotten surroundings, once so familiar; the gaily-decorated rooms, the rhythmic music, the twinkle of jewels, the murmurr of gliding feet and the rustle of costly gowns, the moving vision of honest gentlemen and fair ladies; the shameful years seemed to drop away and leave him to take up the thread of his life where it had snapped so disastrously. After all, these were his own people. The seedy knives in whose steps he had walked of late were but aliens met by the way.

He surrendered his partner, in due course, with regret—which was mutual—to an inarticulate subaltern, and was meditating another pilgrimage to the refreshment-room, when he felt a light touch upon his arm. He turned swiftly. A touch on the arm meant more to him than to some men. But it was no wooden-faced plain-clothes man that he confronted; it was only a lady. In short, it was Mrs. Chater, smiling nervously and a little abashed by her own boldness.

“I expect you’ve forgotten me,” she began apologetically, but Augustus interrupted her with an eager disclaimer.

“Of course I haven’t,” he said; “though I have forgotten your name, but I remember that Portsmouth dance as well as if it were yesterday; at least one incident in it—the only one that was worth remembering. I’ve often hoped that I might meet you again, and now, at last, it has happened.”

“It’s nice of you to remember,” she rejoined. “I’ve often and often thought of that evening and all the wonderful things that we talked about. You were a nice boy then; I wonder what you are like now. What a long time ago it is!”

“Yes,” Augustus agreed gravely, “it is a long time. I know it myself; but when I look at you, it seems as if it could only have been last season.”

“Oh, fie!” she exclaimed. “You are not simple as you used to be. You didn’t flatter then; but perhaps there wasn’t the need.” She spoke with gentle reproach, but her pretty face flushed with pleasure nevertheless, and there was a certain wistfulness in the tone of her concluding sentence.

“I wasn’t flattering,” Augustus replied, quite sincerely; “I knew you directly you entered the room and marvelled that Time had been so gentle with you. He hasn’t been as kind to me.”

“No. You have gotten a few grey hairs, I see, but after all, what are grey hairs to a man? Just the badges of rank, like the crown on your collar or the lace on your cuffs, to mark the steps of your promotion—for I guess you’ll be a colonel by now.”

“No,” Augustus answered quickly, with a faint flush, “I left the army some years ago.”

“My! what a pity!” exclaimed Mrs. Chater. “You must tell me all about it—but not now. My partner will be looking for me. We will sit out a dance and have a real gossip. But I’ve forgotten your name—never could recall it, in fact, though that didn’t prevent me from remembering you; but, as our dear W. S. remarks, ‘What’s in a name—’”

“Ah, indeed,” said Mr. Harrington-Baillie; and apropos of that sentiment, he added: “Mine is Rowland—Captain Rowland. You may remember it now.”

Mrs. Chater did not, however, and said so. “Will number six do?” she asked, opening her programme; and, when Augustus had assented, she entered his provisional name, remarking complacently: “We’ll sit out and have a right-down good talk, and you shall tell me all about yourself and if you still think the same about free-will and personal responsibility. You had very lofty ideals, I remember, in those days, and I hope you have still. But one’s ideals get rubbed down rather
faint in the friction of life. Don’t you think so?”

“Yes, I am afraid you’re right,” Augustus assented gloomily. “The wear and tear of life soon fetches the gilt off the gingerbread. Middle age is apt to find us a bit patchy, not to say naked.”

“Oh, don’t be pessimistic,” said Mrs. Chater; “that is the attitude of the disappointed idealist, and I am sure you have no reason, really, to be disappointed in yourself. But I must run away now. Think over all the things you have to tell me, and don’t forget that it is number six.” With a bright smile and a friendly nod she sailed away, a vision of glittering splendour, compared with which Solomon in all his glory was a mere matter of commonplace bullion.

The interview, evidently friendly and familiar, between the unknown guest and the famous American widow had by no means passed unnoticed; and in other circumstances, Bailey might have endeavoured to profit by the reflected glory that enveloped him. But he was not in search of notoriety; and the same evasive instinct that had led him to sink Mr. Harrington-Baillie in Captain Rowland, now advised him to withdraw his dual personality from the vulgar gaze. He had come here on very definite business. For the hundredth time he was “stony-broke,” and it was the hope of picking up some “unconsidered trifles” that had brought him. But, somehow, the atmosphere of the place had proved unfavourable. Either opportunities were lacking or he failed to seize them. In any case, the game pocket that formed an unconventional feature of his dress-coat was still empty, and it looked as if a pleasant evening and a good supper were all that he was likely to get. Nevertheless, be his conduct never so blameless, the fact remained that he was an uninvited guest, liable at any moment to be ejected as an impostor, and his recognition by the widow had not rendered this possibility any the more remote.

He strayed out onto the lawn, whence the grounds fell away on all sides. But there were other guests there, cooling themselves after the last dance, and the light from the rooms streamed through the windows, illuminating their figures, and among them, that of the too-companionable Granby. Augustus quickly drew away from the lighted area, and, chancing upon a narrow path, strolled along it in the direction of a copse or shrubbery that he saw ahead. Presently he came to an ivy-covered arch, lighted by one or two fairy lamps, and, passing through this, he entered a winding path, bordered by trees and shrubs and but faintly lighted by an occasional coloured lamp suspended from a branch.

Already he was quite clear of the crowd; indeed, the deserted condition of the pleasant retreat rather surprised him, until he reflected that to couples desiring seclusion there were whole ranges of untenanted rooms and galleries available in the empty house.

The path sloped gently downwards for some distance; then came a long flight of rustic steps and, at the bottom, a seat between two trees. In front of the seat the path extended in a straight line, forming a narrow terrace; on the right the ground sloped up steeply towards the lawn; on the left it fell away still more steeply towards the encompassing wall of the grounds; and on both sides it was covered with trees and shrubs.

Bailey sat down on the seat to think over the account of himself that he should present to Mrs. Chater. It was a comfortable seat, built into the trunk of an elm, which formed one end and part of the back. He leaned against the tree, and, taking out his silver case, selected a cigarette. But it remained unlighted between his fingers as he sat and meditated upon his unsatisfactory past and the melancholy tale of what might have been. Fresh from the atmosphere of refined opulence that pervaded the dancing-rooms, the throng of well-groomed men and dainty women, his mind travelled back to his sordid little flat in Bermondsey, encompassed by poverty and squalor, jostled by lofty factories, grimy with the smoke of the river and the reek from the great chimneys. It was a hideous contrast. Verily the way of the transgressor was not strewn with flowers.

At that point in his meditations he caught the sound of voices and footsteps on the path above and rose to walk on along the path. He did not wish to be seen wandering alone in the shrubbery. But now a woman’s laugh sounded from somewhere down the path. There were people approaching that way too. He put the cigarette back in the case and stepped round behind the seat, intending to retreat in that direction, but here the path ended, and beyond was nothing but a rugged slope down to the wall thickly covered with bushes. And while he was hesitating, the sound of feet descending the steps and the rustle of a woman’s dress left him to choose between staying where he was or coming out to confront the new-comers. He chose the former, drawing up close behind the tree to wait until they should have passed on.

But they were not going to pass on. One of them—a woman—sat down on the seat, and then a familiar voice smote on his ear.

“I guess I’ll rest here quietly for a while; this tooth of mine is aching terribly; and, see here, I want you to go and fetch me something. Take this ticket to the cloak-room and tell the woman to give you my little velvet bag. You’ll find it in a bottle of chloroform and a packet of cotton-wool.”

“But I can’t leave you here all alone, Mrs. Chater,” her partner expostulated.

“I’m not hankering for society just now,” said Mrs. Chater. “I want that chloroform. Just you hustle off and fetch it, like a good boy. Here’s the ticket.”

The young officer’s footsteps retreated rapidly, and the voices of the couple advancing along the path grew louder. Bailey, cursing the chance that had placed him in his ridiculous and uncomfortable position, heard them approach and pass on up the steps; and then all was silent, save for an occasional moan from Mrs. Chater and the measured creaking of the seat as she rocked uneasily to and fro. But the young man was uncommonly prompt in the discharge of his mission, and in a very few minutes Bailey heard him approaching at a run along the path above and then bounding down the steps.
“Now I call that real good of you,” said the widow gratefully. “You must have run like the wind. Cut the string of the packet and then leave me to wrestle with this tooth.”

“But I can’t leave you here all—”

“Yes, you can,” interrupted Mrs. Chater. “There won’t be any one about—the next dance is a waltz. Besides, you must go and find your partners.”

“Well, if you’d really rather be alone,” the subaltern began; but Mrs. Chater interrupted him.

“Of course I would, when I’m fixing up my teeth. Now go along, and a thousand thanks for your kindness.”

With mumbled protestations the young officer slowly retired, and Bailey heard his reluctant feet ascending the steps. Then a deep silence fell on the place in which the rustle of paper and the squeak of a withdrawn cork seemed loud and palpable. Bailey had turned with his face towards the tree, against which he leaned with his lips parted scarcely daring to breathe. He cursed himself again and again for having thus entrapped himself for no tangible reason, and longed to get away. But there was no escape now without betraying himself. He must wait for the woman to go.

Suddenly, beyond the edge of the tree, a hand appeared holding an open packet of cotton-wool. It laid the wool down on the seat, and, pinching off a fragment, rolled it into a tiny ball. The fingers of the hand were encircled by rings, its wrist enclosed by a broad bracelet; and from rings and bracelet the light of the solitary fairy-lamp, that hung from a branch of the tree, was reflected in prismatic sparks. The hand was withdrawn and Bailey stared dreamily at the square pad of cotton-wool. Then the hand came again into view. This time it held a small phial which it laid softly on the seat, setting the cork beside it. And again the light flashed in many-coloured scintillations from the encrusting gems.

Bailey’s knees began to tremble, and a chilly moisture broke out upon his forehead.

The hand drew back, but, as it vanished, Bailey moved his head silently until his face emerged from behind the tree. The woman was leaning back, her head resting against the trunk only a few inches away from his face. The great stones of the tiara flashed in his very eyes. Over her shoulder, he could even see the gorgeous pendant, rising and falling on her bosom with ever-changing fires; and both her raised hands were a mass of glitter and sparkle, only the deeper and richer for the subdued light.

His heart throbbed with palpable blows that drummed aloud in his ears. The sweat trickled clammy down his face, and he clenched his teeth to keep them from chattering. An agony of horror—of deadly fear—was creeping over him? a terror of the dreadful impulse that was stealing away his reason and his will.

The silence was profound. The woman’s soft breathing, the creak of her bodice, were plainly—grossly—audible; and he checked his own breath until he seemed on the verge of suffocation.

Of a sudden through the night air was borne faintly the dreamy music of a waltz. The dance had begun. The distant sound but deepened the sense of solitude in this deserted spot.

Bailey listened intently. He yearned to escape from the invisible force that seemed to be clutching at his wrists, and dragging him forward inexorably to his doom.

He gazed down at the woman with a horrid fascination. He struggled to draw back out of sight—and struggled in vain.

Then, at last, with a horrible, stealthy deliberation, a clammy, shaking hand crept forward towards the seat. Without a sound it grasped the wool, and noiselessly, slowly drew back. Again it stole forth. The fingers twined snakily around the phial, lifted it from the seat and carried it back into the shadow.

After a few seconds it reappeared and softly replaced the bottle—now half empty. There was a brief pause. The measured cadences of the waltz stole softly through the quiet night and seemed to keep time with the woman’s breathing. Other sound there was none. The place was wrapped in the silence of the grave.

Suddenly, from the hiding-place, Bailey leaned forward over the back of the seat. The pad of cotton-wool was in his hand.

The woman was now leaning back as if dozing, and her hands rested in her lap. There was a swift movement. The pad was pressed against her face and her head dragged back against the chest of the invisible assailant. A smothered gasp burst from her hidden lips as her hands flew up to clutch at the murderous arm; and then came a frightful struggle, made even more frightful by the gay and costly trappings of the writhing victim. And still there was hardly a sound; only muffled gases, the rustle of silk, the creaking of the seat, the clink of the falling bottle and, afar off, with dreadful irony, the dreamy murmur of the waltz.

The struggle was but brief. Quite suddenly the jewelled hands dropped, the head lay resistless on the crumpled shirt-front, and the body, now limp and inert, began to slip forward off the seat. Bailey, still grasping the passive head, climbed over the back of the seat and, as the woman slid gently to the ground, he drew away the pad and stooped over her. The struggle was over now; the mad fury of the moment was passing swiftly into the chill of mortal fear.

He stared with incredulous horror into the swollen face, but now so comely, the sightless eyes that but a little while since had smiled into his with such kindly recognition.

He had done this! He, the sneaking wastrel, discarded of all the world, to whom this sweet woman had held out the hand
of friendship. She had cherished his memory, when to all others he was sunk deep under the waters of oblivion. And he had killed her—for to his ear no breath of life seemed to issue from those purple lips.

A sudden hideous compunction for this revorable thing that he had done surged through him, and he stood up clutching at his damp hair with a hoarse cry that was like the cry of the damned.

The jewels passed straightway out of his consciousness. Everything was forgotten now but the horror of this unspeakable thing that he had done. Remorseful and haunting fear were all that were left to him.

The sound of voices far away along the path aroused him, and the vague horror that possessed him materialized into abject bodily fear. He lifted the limp body to the edge of the path and let it slip down the steep declivity among the bushes. A soft, shuddering sigh came from the parted lips as the body turned over, and he paused a moment to listen. But there was no other sound of life. Doubtless that sigh was only the result of the passive movement.

Again he stood for an instant as one in a dream, gazing at the huddled shape half hidden by the bushes, before he climbed back to the path; and even then he looked back once more, but now she was hidden from sight. And, as the voices drew nearer, he turned, and ran up the rustic steps.

As he came out on the edge of the lawn the music ceased, and, almost immediately, a stream of people issued from the house. Shaken as he was, Bailey yet had wits enough left to know that his clothes and hair were disordered and that his appearance must be wild. Accordingly he avoided the dancers, and, keeping to the margin of the lawn, made his way to the cloak-room by the least frequented route. If he had dared, he would have called in at the refreshment-room, for he was deadly faint and his limbs shook as he walked. But a haunting fear pursued him and, indeed, grew from moment to moment. He found himself already listening for the rumour of the inevitable discovery.

He staggered into the cloak-room, and, flinging his ticket down on the table, dragged out his watch. The attendant looked at him curiously and, pausing with the ticket in his hand, asked sympathetically: "Not feeling very well, sir?"

"No," said Bailey. "So beastly hot in there."

"You ought to have a glass of champagne, sir, before you start," said the man.

"No time," replied Bailey, holding out a shaky hand for his coat. "Shall lose my train if I'm not sharp."

At this hint the attendant reached down the coat and hat, holding up the former for its owner to slip his arms into the sleeves. But Bailey snatched it from him, and, flinging it over his arm, put on his hat and hurried away to the coachhouse. Here, again, the attendant stared at him in astonishment, which was not lessened when Bailey, declining his offer to help him on with his coat, bundled the latter under his arm, clicked the lever of the "variable" on to the ninety gear, sprang onto the machine and whirled away down the steep drive, a grotesque vision of flying coat-tails.

"You haven't lit your lamp, sir," roared the attendant; but Bailey's ears were deaf to all save the clamour of the expected pursuit.

Fortunately the drive entered the road obliquely, or Bailey must have been flung into the opposite hedge. As it was, the machine, rushing down the slope, flew out into the road with terrific velocity; nor did its speed diminish then, for its rider, impelled by mortal terror, trod the pedals with the fury of a madman. And still, as the machine whizzed along the dark and silent road, his ears were strained to catch the clatter of hoofs or the throb of a motor from behind.

He knew the country well, in fact, as a precaution, he had cycled over the district only the day before; and he was ready, at any suspicious sound, to slip down any of the lanes or byways, secure of finding his way. But still he sped on, and still no sound from the rear came to tell him of the dread discovery.

When he had ridden about three miles, he came to the foot of a steep hill. Here he had to dismount and push his machine up the incline, which he did at such speed that he arrived at the top quite breathless. Before mounting again he determined to put on his coat, for his appearance was calculated to attract attention, if nothing more. It was only half-past eleven, and presently he would pass through the streets of a small town. Also he would light his lamp. It would be fatal to be stopped by a patrol or rural constable.

Having lit his lamp and hastily put on his coat he once more listened intently, looking back over the country that was darkly visible from the summit of the hill. No moving lights were to be seen, no ringing hoofs or throbbing engines to be heard, and, turning to mount, he instinctively felt in his overcoat pocket for his gloves.

A pair of gloves came out in his hand, but he was instantly conscious that they were not his. A silk muffler was there also; a white one. But his muffler was black.

With a sudden shock of terror he thrust his hand into the ticket-pocket, where he had put his latch-key. There was no key there; only an amber cigar-holder, which he had never seen before. He stood for a few moments in utter consternation. He had taken the wrong coat. Then he had left his own coat behind. A cold sweat of fear broke out afresh on his face as he realized this. His Yale latch-key was in its pocket; not that that mattered very much. He had a duplicate at home, and, as to getting in, well, he knew his own outside door and his tool-bag contained one or two trifles not usually found in cyclists’ tool-bags. The question was whether that coat contained anything that could disclose his identity. And then suddenly he remembered, with a gasp of relief, that he had carefully turned the pockets out before starting.

No; once let him attain the sanctuary of his grimy little flat, wedged in as it was between the great factories by the river-
side, and he would be safe: safe from everything but the horror of himself, and the haunting vision of a jewelled figure huddled up in a silken heap beneath the bushes.

With a last look round he mounted his machine, and, driving it over the brow of the hill, swept away into the darkness.

**PART II. — MUNERA PULVERIS**

*(RELATED BY CHRISTOPHER JERVIS, M.D.)*

IT is one of the drawbacks of medicine as a profession that one is never rid of one’s responsibilities. The merchant, the lawyer, the civil servant, each at the appointed time locks up his desk, puts on his hat and goes forth a free man with an interval of uninterrupted leisure before him. Not so the doctor. Whether at work or at play, awake or asleepe, he is the servant of humanity, at the instant disposal of friend or stranger alike whose need may make the necessary claim.

When I agreed to accompany my wife to the spinsters’ dance at Raynesford, I imagined that, for that evening, at least, I was definitely off duty; and in that belief I continued until the conclusion of the eighth dance. To be quite truthful, I was not sorry when the delusion was shattered. My last partner was a young lady of a slanginess of speech that verged on the inarticulate. Now it is not easy to exchange ideas in “pidgin” English; and the conversation of a person to whom all things are either “ripping” or “rotten” is apt to lack subtlety. In fact, I was frankly bored; and, reflecting on the utility of the humble sandwich as an aid to conversation, I was about to entice my partner to the refreshment-room when I felt someone pluck at my sleeve. I turned quickly and looked into the anxious and rather frightened face of my wife.

“Miss Halliwell is looking for you,” she said. “A lady has been taken ill. Will you come and see what is the matter?” She took my arm and, when I had made my apologies to my partner, she hurried me on to the lawn.

“It’s a mysterious affair,” my wife continued. “The sick lady is a Mrs. Chater, a very wealthy American widow. Edith Halliwell and Major Podbury found her lying in the shrubbery all alone and unable to give any account of herself. Poor Edith is dreadfully upset. She doesn’t know what to think.”

“What do you mean?” I began; but at this moment Miss Halliwell, who was waiting by an ivy-covered rustic arch, espied us and ran forward.

“Oh, do hurry, please, Dr. Jervis,” she exclaimed; “such a shocking thing has happened. Has Juliet told you?” Without waiting for an answer, she darted through the arch and preceded us along a narrow path at the curious, flat-footed, shambling trot common to most adult women. Presently we descended a flight of rustic steps which brought us to a seat, from whence extended a straight path cut like a miniature terrace on a steep slope, with a high bank rising to the right and declivity falling away to the left. Down in the hollow, his head and shoulders appearing above the bushes, was a man holding in his hand a fairy-lamp that he had apparently taken down from a tree. I climbed down to him, and, as I came round the bushes, I perceived a richly-dressed woman lying huddled on the ground. She was not completely insensible, for she moved slightly at my approach, muttering a few words in thick, indistinct accents. I took the lamp from the man, whom I assumed to be Major Podbury, and, as he delivered it to me with a significant glance and a faint lift of the eyebrows, I understood Miss Halliwell’s agitation. Indeed—for one horrible moment I thought that she was right—that the prostrate woman was intoxicated. But when I approached nearer, the flickering light of the lamp made visible a square reddened patch on her face, like the impression of a mustard plaster, covering the nose and mouth; and then I scented mischief of a more serious kind.

“We had better carry her up to the seat,” I said, handing the lamp to Miss Halliwell. “Then we can consider moving her to the house.” The major and I lifted the helpless woman and, having climbed cautiously up to the path, laid her on the seat.

“What is it, Dr. Jervis?” Miss Halliwell whispered.

“I can’t say at the moment,” I replied; “but it’s not what you feared.”

“Thank God for that!” was her fervent rejoinder. “It would have been a shocking scandal.”

I took the dim lamp and once more bent over the half-conscious woman.

Her appearance puzzled me not a little. She looked like a person recovering from an anaesthetic, but the square red patch on her face, recalling, as it did, the Burke murders, rather suggested suffocation. As I was thus reflecting, the light of the lamp fell on a white object lying on the ground behind the seat, and holding the lamp forward, I saw that it was a square pad of cotton-wool. The coincidence of its shape and size with that of the red patch on the woman’s face instantly struck me, and I stooped down to pick it up; and then I saw, lying under the seat, a small bottle. This also I picked up and held in the lamplight. It was a one-ounce phial, quite empty, and was labelled “Methylated Chloroform.” Here seemed to be a complete explanation of the thick utterance and drunken aspect; but it was an explanation that required, in its turn, to be explained. Obviously no robbery had been committed, for the woman literally glittered with diamonds. Equally obviously she had not administered the chloroform to herself.

There was nothing for it but to carry her indoors and await her further recovery, so, with the major’s help, we conveyed her through the shrubbery and kitchen garden to a side door, and deposited her on a sofa in a half-furnished room.

Here, under the influence of water dabbed on her face and the plentiful use of smelling salts, she quickly revived, and was soon able to give an intelligible account of herself.
The chloroform and cotton-wool were her own. She had used them for an aching tooth; and she was sitting alone on the seat with the bottle and the wool beside her when the incomprehensible thing had happened. Without a moment’s warning a hand had come from behind her and pressed the pad of wool over her nose and mouth. The wool was saturated with chloroform, and she had lost consciousness almost immediately.

“‘You didn’t see the person, then?’ I asked.
“‘No, but I know he was in evening dress, because I felt my head against his shirt-front.”
“Then,” said I, “he is either here still or he has been to the cloak-room. He couldn’t have left the place without an overcoat.”

“No, by Jove!” exclaimed the major; “that’s true. I’ll go and make inquiries.” He strode away all agog, and I, having satisfied myself that Mrs. Chater could be left safely, followed him almost immediately.

I made my way straight to the cloak-room, and here I found the major and one or two of his brother officers putting on their coats in a flutter of gleeful excitement.

“He’s gone,” said Podbury, struggling frantically into his overcoat; “went off nearly an hour ago on a bicycle. Seemed in a deuce of a stew, the attendant says, and no wonder. We’re goin’ after him in our car. Care to join the hunt?”

“No, thanks. I must stay with the patient. But how do you know you’re after the right man?”

“Isn’t any other. Only one Johnnie’s left. Besides—here, confound it! you’ve given me the wrong coat!” He tore off the garment and handed it back to the attendant, who regarded it with an expression of dismay.

“Are you sure, sir?” he asked.

“Perfectly,” said the major. “Come, hurry up, my man.”

“I’m afraid, sir,” said the attendant, “that the gentleman who has gone has taken your coat. They were on the same peg, I know. I am very sorry, sir.”

The major was speechless with wrath. What the devil was the good of being sorry; and how the duce was he to get his coat back—

“But,” I interposed, “if the stranger has got your coat, then this coat must be his.”

“I know,” said Podbury; “but I don’t want his beastly coat.”

“No,” I replied, “but it may be useful for identification.”

This appeared to afford the bereaved officer little consolation, but as the car was now ready, he bustled away, and I, having directed the man to put the coat away in a safe place, went back to my patient.

Mrs. Chater was by now fairly recovered, and had developed a highly vindictive interest in her late assailant. She even went so far as to regret that he had not taken at least some of her diamonds, so that robbery might have been added to the charge of attempted murder, and expressed the earnest hope that the officers would not be foolishly gentle in their treatment of him when they caught him.

“By the way, Dr. Jervis,” said Miss Halliwell, “I think I ought to mention a rather curious thing that happened in connection with this dance. We received an acceptance from a Mr. Harrington-Baillie, who wrote from the Hotel Cecil. Now I am certain that no such name was proposed by any of the spinsters.”

“But didn’t you ask them?” I inquired.

“Well, the fact is,” she replied, “that one of them, Miss Waters, had to go abroad suddenly, and we had not got her address; and as it was possible that she might have invited him, I did not like to move in the matter. I am very sorry I didn’t now. We may have let in a regular criminal? though why he should have wanted to murder Mrs. Chater I cannot imagine.”

It was certainly a mysterious affair, and the mystery was in no wise dispelled by the return of the search party an hour later. It seemed that the bicycle had been tracked for a couple of miles towards London, but then, at the cross-roads, the tracks had become hopelessly mixed with the impressions of other machines and the officers, after cruising about vaguely for a while, had given up the hunt and returned.

“You see, Mrs. Chater,” Major Podbury explained apologetically, “the fellow must have had a good hour’s start, and that would have brought him pretty close to London.”

“Do you mean to tell me,” exclaimed Mrs. Chater, regarding the major with hardly-concealed contempt, “that that villain has got off scot-free?”

“Looks rather like it,” replied Podbury, “but if I were you I should get the man’s description from the attendants who saw him and go up to Scotland Yard to-morrow. They may know the Johnny there, and they may even recognize the coat if you take it with you.”

“That doesn’t seem very likely,” said Mrs. Chater, and it certainly did not; but since no better plan could be suggested the lady decided to adopt it; and I supposed that I had heard the last of the matter.
In this, however, I was mistaken. On the following day, just before noon, as I was drowsily considering the points in a brief dealing with a question of survivorship, while Thorndyke drafted his weekly lecture, a smart rat-tat at the door of our chambers announced a visitor. I rose wearily—I had had only four hours’ sleep—and opened the door, whereupon there sailed into the room no less a person than Mrs. Chater, followed by Superintendent Miller, with a grin on his face and a brown-paper parcel under his arm.

The lady was not in the best of tempers, though wonderfully lively and alert considering the severe shock that she had suffered so recently, and her disapproval of Miller was frankly obvious.

“Dr. Jervis has probably told you about the attempt to murder me last night,” she said, when I had introduced her to my colleague. “Well, now, will you believe it? I have been to the police, I have given them a description of the murderous villain, and I have even shown them the very coat that he wore, and they tell me that nothing can be done. That, in short, this scoundrel must be allowed to go his way free and unmolested.”

“You will observe, doctor,” said Miller, “that this lady has given us a description that would apply to fifty per cent, of the middle-class men of the United Kingdom, and has shown us a coat without a single identifying mark of any kind on it, and expects us to lay our hands on the owner without a solitary clue to guide us. Now we are not sorcerers at the Yard; we’re only policemen. So I have taken the liberty of referring Mrs. Chater to you.” He grinned maliciously and laid the parcel on the table.

“And what do you want me to do?” Thorndyke asked quietly.

“Why sir,” said Miller, “there is a coat. In the pockets were a pair of gloves, a muffler, a box of matches, a tram-ticket and a Yale key. Mrs. Chater would like to know whose coat it is.” He untied the parcel with his eye cocked at our rather disconcerted client, and Thorndyke watched him with a faint smile.

“This is very kind of you, Miller,” said he, “but I think a clairvoyant would be more to your purpose.”

The superintendent instantly dropped his facetious manner.

“Seriously, sir,” he said, “I should be glad if you would take a look at the coat. We have absolutely nothing to go on, and yet we don’t want to give up the case. I have gone through it most thoroughly and can’t find any clue to guide us. Now I know that nothing escapes you, and perhaps you might notice something that I have overlooked; something that would give us a hint where to start on, our inquiry. Couldn’t you turn the microscope on it, for instance?” he added, with a deprecating smile.

Thorndyke reflected, with an inquisitive eye on the coat. I saw that the problem was not without its attractions to him; and when the lady seconded Miller’s request with persuasive eagerness, the inevitable consequence followed.

“Very well,” he said. “Leave the coat with me for an hour or so and I will look it over. I am afraid there is not the remotest chance of our learning anything from it, but even so, the examination will have done no harm. Come back at two o’clock; I shall be ready to report my failure by then.”

He bowed our visitors out and, returning to the table, looked down with a quizzical smile on the coat and the large official envelope containing articles from the pockets.

“And what does my learned brother suggest?” he asked, looking up at me.

“I should look at the tram-ticket first,” I replied, “and then—well, Miller’s suggestion wasn’t such a bad one; to explore the surface with the microscope.”

“I think we will take the latter measure first,” said he. “The tram-ticket might create a misleading bias. A man may take a tram anywhere, whereas the indoor dust on a man’s coat appertains mostly to a definite locality.”

“Yes,” I replied; “but the information that it yields is excessively vague.”

“That is true,” he agreed, taking up the coat and envelope to carry them to the laboratory, “and yet, you know, Jervis, as I have often pointed out, the evidential value of dust is apt to be under-estimated. The naked-eye appearances? which are the normal appearances—are misleading. Gather the dust, say, from a table-top, and what have you? A fine powder of a characterless grey, just like any other dust from any other table-top. But, under the microscope, this grey powder is resolved into recognizable fragments of definite substances, which fragments may often be traced with certainty to the masses from which they have been detached. But you know all this as well as I do.”

“I quite appreciate the value of dust as evidence in certain circumstances,” I replied, “but surely the information that could be gathered from dust on the coat of an unknown man must be too general to be of any use in tracing the owner.”

“I am afraid you are right,” said Thorndyke, laying the coat on the laboratory bench; “but we shall soon see, if Polton will let us have his patent dust-extractor.”

The little apparatus to which my colleague referred was the invention of our ingenious laboratory assistant, and resembled in principle the “vacuum cleaners” used for restoring carpets. It had, however, one special feature: the receiver was made to admit a microscope-slide, and on this the dust-laden air was delivered from a jet.

The “extractor” having been clamped to the bench by its proud inventor, and a wetted slide introduced into the receiver, Thorndyke applied the nozzle of the instrument to the collar of the coat while Polton worked the pump. The slide was then
removed and, another having been substituted, the nozzle was applied to the right sleeve near the shoulder, and the exhauster again worked by Polton. By repeating this process, half-a-dozen slides were obtained charged with dust from different parts of the garment, and then, setting up our respective microscopes, we proceeded to examine the samples.

A very brief inspection showed me that this dust contained matter not usually met with—at any rate, in appreciable quantities. There were, of course, the usual fragments of wool, cotton and other fibres derived from clothing and furniture, particles of straw, husk, hair, various mineral particles and, in fact, the ordinary constituents of dust from clothing. But, in addition to these, and in much greater quantity, were a number of other bodies, mostly of vegetable origin and presenting well-defined characters in considerable variety, and especially abundant were various starch granules.

I glanced at Thorndyke and observed he was already busy with a pencil and a slip of paper, apparently making a list of the objects visible in the field of the microscope. I hastened to follow his example, and for a time we worked on in silence. At length my colleague leaned back in his chair and read over his list.

"This is a highly interesting collection, Jervis," he remarked. "What do you find on your slides out of the ordinary?"

"I have quite a little museum here," I replied, referring to my list. "There is, of course, chalk from the road at Raynesford. In addition to this I find various starches, principally wheat and rice, especially rice, fragments of the cortices of several seeds, several different stone-cells, some yellow masses that look like turmeric, black pepper resin-cells, one 'port wine' pimento cell, and one or two particles of graphite."

"Graphite!" exclaimed Thorndyke. "I have found no graphite, but I have found traces of cocoa—spiral vessels and starch grains—and of hops—one fragment of leaf and several lupulin glands. May I see the graphite?"

I passed him the slide and he examined it with keen interest. "Yes," he said, "this is undoubtedly graphite, and no less than six particles of it. We had better go over the coat systematically. You see the importance of this?"

"I see that this is evidently factory dust and that it may fix a locality, but I don't see that it will carry us any farther."

"Don't forget that we have a touchstone," said he; and, as I raised my eyebrows inquiringly, he added, "The Yale latchkey. If we can narrow the locality down sufficiently, Miller can make a tour of the front doors."

"But can we?" I asked incredulously. "I doubt it."

"We can try," answered Thorndyke. "Evidently some of the substances are distributed over the entire coat, inside and out, while others, such as the graphite, are present only on certain parts. We must locate those parts exactly and then consider what this special distribution means." He rapidly sketched out on a sheet of paper a rough diagram of the coat, marking each part with a distinctive letter, and then, taking a number of labelled slides, he wrote a single letter on each. The samples of dust taken on the slides could thus be easily referred to the exact spots whence they had been obtained.

Once more we set to work with the microscope, making, now and again, an addition to our lists of discoveries, and, at the end of nearly an hour's strenuous search, every slide had been examined and the lists compared.

"The net result of the examination," said Thorndyke, "is this. The entire coat, inside and out, is evenly powdered with the following substances: Rice-starch in abundance, wheat-starch in less abundance, and smaller quantities of the starches of ginger, pimento and cinnamon; bast fibre of cinnamon, various seed cortices, stone-cells of pimento, cinnamon, cassia and black pepper, with other fragments of similar origin, such as resin-cells and ginger pigment—not turmeric. In addition there are, on the right shoulder and sleeve, traces of cocoa and hops, and on the back below the shoulders a few fragments of graphite. Those are the data; and now, what are the inferences? Remember this is not mere surface dust, but the accumulation of months, beaten into the cloth by repeated brushing—dust that nothing but a vacuum apparatus could extract."

"Evidently," I said, "the particles that are all over the coat represent dust that is floating in the air of the place where the coat habitually hangs. The graphite has obviously been picked up from a seat and the cocoa and hops from some factories that the man passes frequently, though I don't see why they are on the right side only."

"That is a question of time," said Thorndyke, "and incidentally throws some light on our friend's habits. Going from home, he passes the factories on his right; returning home, he passes them on his left, but they have then stopped work. However, the first group of substances is the more important as they indicate the locality of his dwelling—for he is clearly not a workman or factory employee. Now rice-starch, wheat-starch and a group of substances collectively designated 'spices' suggest a rice-mill, a flour-mill and a spice factory. Polton, may I trouble you for the Post Office Directory?"

He turned over the leaves of the "Trades" section and resumed: "I see there are four rice-mills in London, of which the largest is Carbutt's at Dockhead. Let us look at the spice-factories." He again turned over the leaves and read down the list of names. "There are six spice-grinders in London," said he. "One of them, Thomas Williams & Co., is at Dockhead. None of the others is near any rice-mill. The next question is as to the flour-mill. Let us see. Here are the names of several flour millers, but none of them is near either a rice-mill or a spice-grinder, with one exception: Seth Taylor's, St. Saviour's Flour Mills, Dockhead."

"This is really becoming interesting," said I.

"It has become interesting," Thorndyke retorted. "You observe that at Dockhead we find the peculiar combination of factories necessary to produce the composite dust in which this coat has hung; and the directory shows us that this particular combination exists nowhere else in London. Then the graphite, the cocoa and the hops tend to confirm the other
suggestions. They all appertain to industries of the locality. The trams which pass Dockhead, also, to my knowledge, pass at no great distance from the black-lead works of Pearce Duff & Co. in Rouel Road, and will probably collect a few particles of black-lead on the seats in certain states of the wind. I see, too, that there is a cocoa factory—Payne’s—in Goat Street, Horsleydown, which lies to the right of the tram line going west, and I have noticed several hop warehouses on the right side of Southwark Street, going west. But these are mere suggestions; the really important data are the rice and flour mills and the spice-grinders, which seem to point unmistakably to Dockhead."

"Are there any private houses at Dockhead?" I asked.

"We must look up the ‘Street’ list," he replied. "The Yale latch-key rather suggests a flat, and a flat with a single occupant, and the probable habits of our absent friend offer a similar suggestion." He ran his eye down the list and presently turned to me with his finger on the page.

"If the facts that we have elicited—the singular series of agreements with the required conditions—are only a string of coincidences, here is another. On the south side of Dockhead, actually next door to the spice-grinders and opposite to Carbutt’s rice-mills, is a block of workmen’s flats, Hanover Buildings. They fulfil the conditions exactly. A coat hung in a room in those flats, with the windows open (as they would probably be at this time of year), would be exposed to the air containing a composite dust of precisely the character of that which we have found. Of course, the same conditions obtain in other dwellings in this part of Dockhead, but the probability is in favour of the buildings. And that is all that we can say. It is no certainty. There may be some radical fallacy in our reasoning. But, on the face of it, the chances are a thousand to one that the door that that key will open is in some part of Dockhead, and most probably in Hanover Buildings. We must leave the verification to Miller."

"Wouldn’t it be as well to look at the tram-ticket?" I asked.

"Dear me!" he exclaimed. "I had forgotten the ticket. Yes, by all means." He opened the envelope and, turning its contents out on the bench, picked up the dingy slip of paper. After a glance at it he handed it to me. It was punched for the journey from Tooley Street to Dockhead.

"Another coincidence," he remarked; "and by yet another, I think I hear Miller knocking at our door."

It was the superintendent, and, as we let him into the room, the hum of a motor-car entering from Tudor Street announced the arrival of Mrs. Chater. We waited for her at the open door, and, as she entered, she held out her hands impulsively.

"Say, now, Dr. Thorndyke," she exclaimed, "have you gotten something to tell us?"

"I have a suggestion to make," replied Thorndyke. "I think that if the superintendent will take this key to Hanover Buildings, Dockhead, Bermondsey, he may possibly find a door that it will fit."

"The deuce!" exclaimed Miller. "I beg your pardon, madam; but I thought I had gone through that coat pretty completely. What was it that I had overlooked, sir? Was there a letter hidden in it, after all?"

"You overlooked the dust on it, Miller; that is all," said Thorndyke.

"Dust!" exclaimed the detective, staring round-eyed at my colleague. Then he chuckled softly. "Well," said he, "as I said before, I’m not a sorcerer; I’m only a policeman." He picked up the key and asked: "Are you coming to see the end of it, sir?"

"Of course he is coming," said Mrs. Chater, "and Dr. Jervis too, to identify the man. Now that we have gotten the villain we must leave him no loophole for escape."

Thorndyke smiled dryly. "We will come if you wish it, Mrs. Chater," he said, "but you mustn’t look upon our quest as a certainty. We may have made an entire miscalculation, and I am, in fact, rather curious to see if the result works out correctly. But even if we run the man to earth, I don’t see that you have much evidence against him. The most that you can prove is that he was at the house and that he left hurriedly."

Mrs. Chater regarded my colleague for a moment in scornful silence, and then, gathering up her skirts, stalked out of the room. If there is one thing that the average woman detests more than another, it is an entirely reasonable man.

The big car whirled us rapidly over Blackfriars Bridge into the region of the Borough, whence we presently turned down Tooley Street towards Bermondsey.

As soon as Dockhead came into view, the detective, Thorndyke and I, alighted and proceeded on foot, leaving our client, who was now closely veiled, to follow at a little distance in the car. Opposite the head of St. Saviour’s Dock, Thorndyke halted and, looking over the wall, drew my attention to the snowy powder that had lodged on every projection on the backs of the tall buildings and on the decks of the barges that were loading with the flour and ground rice. Then, crossing the road, he pointed to the wooden lantern above the roof of the spice works, the louvres of which were covered with greyish-buff dust.

"Thus," he moralized, "does commerce subserve the ends of justice—at least, we hope it does," he added quickly, as Miller disappeared into the semi-basement of the buildings.

We met the detective returning from his quest as we entered the building.
“No go there,” was his report. “We’ll try the next floor.”

This was the ground-floor, or it might be considered the first floor. At any rate, it yielded nothing of interest, and, after a glance at the doors that opened on the landing, he strode briskly up the stone stairs. The next floor was equally unrewarding, for our eager inspection disclosed nothing but the gaping keyhole associated with the common type of night-latch.

“What name was you wanting?” inquired a dusty knight of industry who emerged from one of the flats.

“Muggs,” replied Miller, with admirable promptness.

“Don’t know ‘im,” said the workman. “I expect it’s farther up.”

Farther up we accordingly went, but still from each door the artless grin of the invariable keyhole saluted us with depressing monotony. I began to grow uneasy, and when the fourth floor had been explored with no better result, my anxiety became acute. A mare’s nest may be an interesting curiosity, but it brings no kudos to its discoverer.

“I suppose you haven’t made any mistake, sir?” said Miller, stopping to wipe his brow.

“It’s quite likely that I have.” replied Thorndyke, with unmoved composure. “I only proposed this search as a tentative proceeding, you know.”

The superintendent grunted. He was accustomed—as was I too, for that matter—to regard Thorndyke’s “tentative suggestions” as equal to another man’s certainties.

“It will be an awful suck-in for Mrs. Chater if we don’t find him after all,” he growled as we climbed up the last flight.

“She’s counted her chickens to a feather.” He paused at the head of the stairs and stood for a few moments looking round the landing. Suddenly he turned eagerly, and, laying his hand on Thorndyke’s arm, pointed to a door in the farthest corner.

“Yale lock!” he whispered impressively.

We followed him silently as he stole on tip-toe across the landing, and watched him as he stood for an instant with the key in his land looking gloatingly at the brass disc. We saw him softly apply the nose of the fluted key-blade to the crooked slit in the cylinder, and, as we watched, it slid noiselessly up to the shoulder. The detective looked round with a grin of triumph, and, silently withdrawing the key, stepped back to us.

“You’ve run him to earth, sir,” he whispered, “but I don’t think Mr. Fox is at home. He can’t have got back yet.”

“Why not?” asked Thorndyke.

Miller waved his hand towards the door. “Nothing has been disturbed,” he replied. “There’s not a mark on the paint. Now he hadn’t got the key, and you can’t pick a Yale lock. He’d have had to break in, and he hasn’t broken in.”

Thorndyke stepped up to the door and softly pushed up in the flap of the letter-slit, through which he looked into the flat.

“There’s no letter-box,” said he. “My dear Miller, I would undertake to open that door in five minutes with a foot of wire and a bit of resined string.”

Miller shook his head and grinned once more. “I am glad you’re not on the lay, sir; you’d be one too many for us. Shall we signal to the lady?”

I went out onto the gallery and looked down at the waiting car. Mrs. Chater was staring intently up at the building, and the little crowd that the car had collected stared alternately at the lady and at the object of her regard. I wiped my face with my handkerchief—the signal agreed upon—and she instantly sprang out of the car, and in an incredibly short time she appeared on the landing, purple and gasping, but with the fire of battle flashing from her eyes.

“We’ve found his flat, madam,” said Miller, “and we’re going to enter. You’re not intending to offer any violence, I hope,” he added, noting with some uneasiness the lady’s ferocious expression.

“Of course I’m not,” replied Mrs. Chater. “In the States ladies don’t have to avenge insults themselves. If you were American men you’d hang the ruffian from his own bedpost.”

“We’re not American men, madam,” said the superintendent stiffly. “We are law-abiding Englishmen, and, moreover, we are all officers of the law. These gentlemen are barristers and I am a police officer.”

With this preliminary caution, he once more inserted the key, and as he turned it and pushed the door open, we all followed him into the sitting-room.

“I told you so, sir,” said Miller, softly shutting the door; “he hasn’t come back yet.”

Apparently he was right. At any rate, there was no one in the flat, and we proceeded unopposed on our tour of inspection. It was a miserable spectacle, and, as we wandered from one squalid room to another, a feeling of pity for the starving wretch into whose lair we were intruding stole over me and began almost to mitigate the hideousness of his crime. On all sides poverty—utter, grinding poverty—stared us in the face. It looked at us hollow-eyed in the wretched sitting-room, with its bare floor, its solitary chair and tiny deal table; its unfurnished walls and windows destitute of blind or curtain. A piece of Dutch cheese-rind on the table, scraped to the thinness of paper, whispered of starvation; and famine lurked in the gaping cupboard, in the empty bread-tin, in the tea-caddy with its pinch of dust at the bottom, in the jam-jar, wiped clean, as a few crumbs testified, with a crust of bread. There was not enough food in the place to furnish a meal for a
healthy mouse.

The bedroom told the same tale, but with a curious variation. A miserable trundle-bed with a straw mattress and a cheap jute rug for bed-clothes, an orange-case, stood on end, for a dressing-table, and another, bearing a tin washing-bowl, formed the wretched furniture. But the suit that hung from a couple of nails was well-cut and even fashionable, though shabby; and another suit lay on the floor, neatly folded and covered with a newspaper; and, most incongruous of all, a silver cigarette-case reposed on the dressing-table.

"Why on earth does this fellow starve," I exclaimed, "when he has a silver case to pawn?"

"Wouldn't do," said Miller. "A man doesn't pawn the implements of his trade."

Mrs. Chater, who had been staring about her with the mute amazement of a wealthy woman confronted, for the first time, with abject poverty, turned suddenly to the superintendent. "This can't be the man!" she exclaimed. "You have made some mistake. This poor creature could never have made his way into a house like Willowdale."

Thorndyke lifted the newspaper. Beneath it was a dress suit with the shirt, collar and tie all carefully smoothed out and folded. Thorndyke unfolded the shirt and pointed to the curiously crumpled front. Suddenly he brought it close to his eye and then, from the sham diamond stud, he drew a single hair—a woman's hair.

"That is rather significant," said he, holding it up between his finger and thumb; and Mrs. Chater evidently thought so too, for the pity and compunction suddenly faded from her face, and once more her eyes flashed with vindictive fire.

"I wish he would come," she exclaimed viciously. "Prison won't be much hardship to him after this, but I want to see him in the dock all the same."

"No," the detective agreed, "it won't hurt him much to swap this for Portland. Listen!"

A key was being inserted into the outer door, and as we all stood like statues, a man entered and closed the door after him. He passed the door of the bedroom without seeing us, and with the dragging steps of a weary, dispirited man. Almost immediately we heard him go to the kitchen and draw water into some vessel. Then he went back to the sitting-room.

"Come along," said Miller, stepping silently towards the door. We followed closely, and as he threw the door open, we looked in over his shoulder.

The man had seated himself at the table, on which now lay a hunk of household bread resting on the paper in which he had brought it, and a tumbler of water. He half rose as the door opened, and as if petrified remained staring at Miller with a dreadful expression of terror upon his livid face.

At this moment I felt a hand on my arm, and Mrs. Chater brusquely pushed past me into the room. But at the threshold she stopped short; and a singular change crept over the man's ghastly face, a change so remarkable that I looked involuntarily from him to our client. She had turned, in a moment, deadly pale, and her face had frozen into an expression of incredulous horror.

The dramatic silence was broken by the matter-of-fact voice of the detective.

"I am a police officer," said he, "and I arrest you for—?"

A peal of hysterical laughter from Mrs. Chater interrupted him, and he looked at her in astonishment. "Stop, stop!" she cried in a shaky voice. "I guess we've made a ridiculous mistake. This isn't the man. This gentleman is Captain Rowland, an old friend of mine."

"I'm sorry he's a friend of yours," said Miller, "because I shall have to ask you to appear against him."

"You can ask what you please," replied Mrs. Chater. "I tell you he's not the man."

The superintendent rubbed his nose and looked hungrily at his quarry. "Do I understand, madam," he asked stiffly, "that you refuse to prosecute?"

"Prosecute!" she exclaimed. "Prosecute my friends for offences that I know they have not committed? Certainly I refuse."

The superintendent looked at Thorndyke, but my colleague's countenance had congealed into a state of absolute immobility and was as devoid of expression as the face of a Dutch clock.

"Very well," said Miller, looking sourly at his watch. "Then we have had our trouble for nothing. I wish you good afternoon, madam."

"I am sorry I troubled you, now," said Mrs. Chater.

"I am sorry you did," was the curt reply; and the superintendent, flinging the key on the table, stalked out of the room.

As the outer door slammed the man sat down with an air of bewilderment; and then, suddenly flinging his arms on the table, he dropped his head on them and burst into a passion of sobbing.

It was very embarrassing. With one accord Thorndyke and I turned to go, but Mrs. Chater motioned us to stay. Stepping over to the man, she touched him lightly on the arm.

"Why did you do it?" she asked in a tone of gentle reproach.

The man sat up and flung out one arm in an eloquent gesture that comprehended the miserable room and the yawning
It was the temptation of a moment,” he said. “I was penniless, and those accursed diamonds were thrust in my face; they were mine for the taking. I was mad, I suppose.”

“But why didn’t you take them?” she said. “Why didn’t you?”

“I don’t know. The madness passed; and then—when I saw you lying there—? Oh, God! Why don’t you give me up to the police?” He laid his head down and sobbed afresh.

Mrs. Chater bent over him with tears standing in her pretty grey eyes. “But tell me,” she said, “why didn’t you take the diamonds? You could if you’d liked, I suppose?”

“What good were they to me?” he demanded passionately. “What did anything matter to me? I thought you were dead.”

“Well, I’m not, you see,” she said, with a rather tearful smile; “I’m just as well as an old woman like me can expect to be. And I want your address, so that I can write and give you some good advice.”

The man sat up and produced a shabby cardcase from his pocket, and, as he took out a number of cards and spread them out like the “hand” of a whist player, I caught a twinkle in Thorndyke’s eye.

“My name is Augustus Bailey,” said the man. He selected the appropriate card, and, having scribbled his address on it with a stump of lead pencil, relapsed into his former position.

“Thank you,” said Mrs. Chater, lingering for a moment by the table. “Now we’ll go. Good-bye, Mr. Bailey. I shall write to-morrow, and you must attend seriously to the advice of an old friend.”

I held open the door for her to pass out and looked back before I turned to follow. Bailey still sat sobbing quietly, with his hand resting on his arms; and a little pile of gold stood on the corner of the table.

“I expect, doctor,” said Mrs. Chater, as Thorndyke handed her into the car, “you’ve written me down a sentimental fool.”

Thorndyke looked at her with an unwonted softening of his rather severe face and answered quietly, “It is written: Blessed are the Merciful.”

V. — THE OLD LAG

AMONG the minor and purely physical pleasures of life, I am disposed to rank very highly that feeling of bodily comfort that one experiences on passing from the outer darkness of a wet winter’s night to a cheerful interior made glad by mellow lamplight and blazing hearth. And so I thought when, on a dreary November night, I let myself into our chambers in the Temple and found my friend smoking his pipe in slippered ease, by a roaring fire, and facing an empty arm-chair evidently placed in readiness for me.

As I shed my damp overcoat, I glanced inquisitively at my colleague, for he held in his hand an open letter, and I seemed to perceive in his aspect something meditative and self-communing—something, in short, suggestive of a new case.

“I was just considering,” he said, in answer to my inquiring look, “whether I am about to become an accessory after the fact. Read that and give me your opinion.”

He handed me the letter, which I read aloud.

“Dear sir,—I am in great danger and distress. A warrant has been issued for my arrest on a charge of which I am entirely innocent. Can I come and see you, and will you let me leave in safety? The bearer will wait for a reply.”

“I said ‘Yes,’ of course; there was nothing else to do,” said Thorndyke. “But if I let him go, as I have promised to do, I shall be virtually conniving at his escape.”

“Yes, you are taking a risk,” I answered. “When is he coming?”

“He was due five minutes ago—and I rather think—yes, here he is.”

A stealthy tread on the landing was followed by a soft tapping on the outer door.

Thorndyke rose and, flinging open the inner door, unfastened the massive “oak.”

“Dr. Thorndyke?” inquired a breathless, quavering voice.

“Yes, come in. You sent me a letter by hand?”

“I did, sir,” was the reply; and the speaker entered, but at the sight of me he stopped short.

“This is my colleague, Dr. Jervis,” Thorndyke explained. “You need have no—?”

“Oh, I remember him,” our visitor interrupted in a tone of relief. “I have seen you both before, you know, and you have seen me too—though I don’t suppose you recognize me,” he added, with a sickly smile.
“Frank Belfield?” asked Thorndyke, smiling also.

Our visitor’s jaw fell and he gazed at my colleague in sudden dismay.

“And I may remark,” pursued Thorndyke, “that for a man in your perilous position, you are running most unnecessary risks. That wig, that false beard and those spectacles—through which you obviously cannot see—are enough to bring the entire police force at your heels. It is not wise for a man who is wanted by the police to make up as though he had just escaped from a comic opera.”

Mr. Belfield seated himself with a groan, and, taking off his spectacles, stared stupidly from one of us to the other.

“And now tell us about your little affair,” said Thorndyke. “You say that you are innocent?”

“I swear it, doctor,” replied Belfield; adding, with great earnestness, “And you may take it from me, sir, that if I was not, I shouldn’t be here. It was you that convicted me last time, when I thought myself quite safe, so I know your ways too well to try to gammon you.”

“If you are innocent,” rejoined Thorndyke, “I will do what I can for you; and if you are not—well, you would have been wiser to stay away.”

“I know that well enough,” said Belfield, “and I am only afraid that you won’t believe what I am going to tell you.”

“I shall keep an open mind, at any rate,” replied Thorndyke.

“If you only will,” groaned Belfield, “I shall have a look in, in spite of them all. You know, sir, that I have been on the crook, but I have paid in full. That job when you tripped me up was the last of it—it was, sir, so help me. It was a woman that changed me—the best and truest woman on God’s earth. She said she would marry me when I came out if I promised her to go straight and live an honest life. And she kept her promise—and I have kept mine. She found me work as clerk in a warehouse and I have stuck to it ever since, earning fair wages and building up a good character as an honest, industrious man. I thought all was going well, and that I was settled for life, when only this very morning the whole thing comes tumbling about my ears like a house of cards.”

“What happened this morning, then?” asked Thorndyke.

“Why, I was on my way to work when, as I passed the police station, I noticed a bill with the heading ‘Wanted’ and a photograph. I stopped for a moment to look at it, and you may imagine my feelings when I recognized my own portrait—taken at Holloway—and read my own name and description. I did not stop to read the bill through, but ran back home and told my wife, and she ran down to the station and read the bill carefully. Good God, sir! What do you think I am wanted for?” He paused for a moment, and then replied in breathless tones to his own question: “The Camberwell murder!”

Thorndyke gave a low whistle.

“My wife knows I didn’t do it,” continued Belfield, “because I was at home all the evening and night; but what use is a man’s wife to prove an alibi?”

“Not much, I fear,” Thorndyke admitted; “and you have no other witness?”

“Not a soul. We were alone all the evening.”

“However,” said Thorndyke, “if you are innocent—as I am assuming—the evidence against you must be entirely circumstantial and your alibi may be quite sufficient. Have you any idea of the grounds of suspicion against you?”

“Not the faintest. The papers said that the police had an excellent clue, but they did not say what it was. Probably someone has given false information for the—?”

A sharp rapping at the outer door cut short the explanation, and our visitor rose, trembling and aghast, with beads of sweat standing upon his livid face.

“You had better go into the office, Belfield, while we see who it is,” said Thorndyke. “The key is on the inside.”

The fugitive wanted no second bidding, but hurried into the empty apartment, and, as the door closed, we heard the key turn in the lock.

As Thorndyke threw open the outer door, he cast a meaning glance at me over his shoulder which I understood when the newcomer entered the room; for it was none other than Superintendent Miller of Scotland Yard.

“I have just dropped in,” said the superintendent, in his brisk, cheerful way, “to ask you to do me a favour. Good-evening, Dr. Jervis. I hear you are reading for the bar; learned counsel soon, sir, hey? Medico-legal expert. Dr. Thorndyke’s mantle going to fall on you, sir?”

“I hope Dr. Thorndyke’s mantle will continue to drape his own majestic form for many a long year yet,” I answered; “though he is good enough to spare me a corner—but what on earth have you got there?” For during this dialogue the superintendent had been deftly unfastening a brown-paper parcel, from which he now drew a linen shirt, once white, but now of an unsavoury grey.

“I want to know what this is,” said Miller, exhibiting a brownish-red stain on one sleeve. “Just look at that, sir, and tell me if it is blood, and, if so, is it human blood?”
“Really, Miller,” said Thorndyke, with a smile, “you flatter me; but I am not like the wise woman of Bagdad who could tell you how many stairs the patient had tumbled down by merely looking at his tongue. I must examine this very thoroughly. When do you want to know?”

“I should like to know to-night,” replied the detective.

“Can I cut a piece out to put under the microscope?”

“I would rather you did not,” was the reply.

“Very well; you shall have the information in about an hour.”

“It’s very good of you, doctor,” said the detective; and he was taking up his hat preparatory to departing, when Thorndyke said suddenly—“By the way, there is a little matter that I was going to speak to you about. It refers to this Camberwell murder case. I understand you have a clue to the identity of the murderer?”

“Clue!” exclaimed the superintendent contemptuously. “We have spotted our man all right, if we could only lay hands on him; but he has given us the slip for the moment.”

“Who is the man?” asked Thorndyke.

The detective looked doubtfully at Thorndyke for some seconds and then said, with evident reluctance: “I suppose there is no harm in telling you—especially as you probably know already”—this with a sly grin; “it’s an old crook named Belfield.”

“And what is the evidence against him?”

Again the superintendent looked doubtful and again relented.

“Why, the case is as clear as—as cold Scotch,” he said (here Thorndyke in illustration of this figure of speech produced a decanter, a syphon and a tumbler, which he pushed towards the officer). “You see, sir, the silly fool went and stuck his sweaty hand on the window; and there we found the marks—four fingers and a thumb, as beautiful prints as you could wish to see. Of course we cut out the piece of glass and took it up to the Finger-print Department; they turned up their files and out came Mr. Belfield’s record, with his finger-prints and photograph all complete.”

“And the finger-prints on the window-pane were identical with those on the prison form?”

“Identical.”

“‘I’m!’ Thorndyke reflected for a while, and the superintendent watched him foxily over the edge of his tumbler.

“I guess you are retained to defend Belfield,” the latter observed presently.

“To look into the case generally,” replied Thorndyke.

“And I expect you know where the beggar is hiding,” continued the detective.

“Belfield’s address has not yet been communicated to me,” said Thorndyke. “I am merely to investigate the case—and there is no reason, Miller, why you and I should be at cross purposes. We are both working at the case; you want to get a conviction and you want to convict the right man.”

“That’s so—and Belfield’s the right man—but what do you want of us, doctor?”

“I should like to see the piece of glass with the finger-prints on it, and the prison form, and take a photograph of each. And I should like to examine the room in which the murder took place—you have it locked up, I suppose?”

“Yes, we have the keys. Well, it’s all rather irregular, letting you see the things. Still, you’ve always played the game fairly with us, so we might stretch a point. Yes, I will. I’ll come back in an hour for your report and bring the glass and the form. I can’t let them go out of my custody, you know. I’ll be off now—no, thank you, not another drop.”

The superintendent caught up his hat and strode away, the personification of mental alertness and bodily vigour.

No sooner had the door closed behind him than Thorndyke’s stolid calm changed instantaneously into feverish energy. Darting to the electric bell that rang into the laboratories above, he pressed the button while he gave me my directions.

“Have a look at that blood-stain, Jervis, while I am finishing with Belfield. Don’t wet it; scrape it into a drop of warm normal saline solution.”

I hastened to reach down the microscope and set out on the table the necessary apparatus and reagents, and, as I was thus occupied, a latch-key turned in the outer door and our invaluable helpmate, Polton, entered the room in his habitual silent, unobtrusive fashion.

“Let me have the finger-print apparatus, please, Polton,” said Thorndyke; “and have the copying camera ready by nine o’clock. I am expecting Mr. Miller with some documents.”

As his laboratory assistant departed, Thorndyke rapped at the office door.

“It’s all clear, Belfield,” he called; “you can come out.”

The key turned and the prisoner emerged, looking ludicrously woebegone in his ridiculous wig and beard.

“I am going to take your finger-prints, to compare with some that the police found on the window.”
“Finger-prints!” exclaimed Belfield, in a tone of dismay. “They don’t say they’re my finger-prints, do they, sir?”

“They do indeed,” replied Thorndyke, eyeing the man narrowly. “They have compared them with those taken when you were at Holloway, and they say that they are identical.”

“Good God!” murmured Belfield, collapsing into a chair, faint and trembling. “They must have made some awful mistake. But are mistakes possible with finger-prints?”

“Now look here, Belfield,” said Thorndyke. “Were you in that house that night, or were you not? It is of no use for you to tell me any lies.”

“I was not there, sir; I swear to God I was not.”

“Then they cannot be your finger-prints, that is obvious.” Here he stepped to the door to intercept Polton, from whom he received a substantial box, which he brought in and placed on the table.

“Tell me all you know about this case,” he continued, as he set out the contents of the box on the table.

“I know nothing about it whatever,” replied Belfield; “nothing, at least, except—?”

“Except what?” demanded Thorndyke, looking up sharply as he squeezed a drop from a tube of finger-print ink onto a smooth copper plate.

“Except that the murdered man, Caldwell, was a retired fence.”

“A fence, was he?” said Thorndyke in a tone of interest.

“Yes; and I suspect he was a ‘nark’ too. He knew more than was wholesome for a good many.”

“Did he know anything about you?”

“Yes; but nothing that the police don’t know.”

With a small roller Thorndyke spread the ink upon the plate into a thin film. Then he laid on the edge of the table a smooth white card and, taking Belfield’s right hand, pressed the forefinger firmly but quickly, first on the inked plate and then on the card, leaving on the latter a clear print of the finger-tip. This process he repeated with the other fingers and thumb, and then took several additional prints of each.

“That was a nasty injury to your forefinger, Belfield,” said Thorndyke, holding the finger to the light and examining the tip carefully. “How did you do it?”

“Stuck a tin-opener into it—a dirty one, too. It was bad for weeks; in fact, Dr. Sampson thought at one time that he would have to amputate the finger.”

“How long ago was that?”

“Oh, nearly a year ago, sir.”

Thorndyke wrote the date of the injury by the side of the finger-print and then, having rolled up the inking plate afresh, laid on the table several larger cards. “I am now going to take the prints of the four fingers and the thumb all at once,” he said.

“They only took the four fingers at once at the prison,” said Belfield. “They took the thumb separately.”

“I know,” replied Thorndyke; “but I am going to take the impression just as it would appear on the window glass.”

He took several impressions thus, and then, having looked at his watch, he began to repack the apparatus in its box. While doing this, he glanced, from time to time, in meditative fashion, at the suspected man who sat, the living picture of misery and terror, wiping the greasy ink from his trembling fingers with his handkerchief.

“Belfield,” he said at length, “you have sworn to me that you are an innocent man and are trying to live an honest life. I believe you; but in a few minutes I shall know for certain.”

“Thank God for that, sir,” exclaimed Belfield, brightening up wonderfully.

“And now,” said Thorndyke, “you had better go back into the office, for I am expecting Superintendent Miller, and he may be here at any moment.”

Belfield hastily slunk back into the office, locking the door after him, and Thorndyke, having returned the box to the laboratory and deposited the cards bearing the finger-prints in a drawer, came round to inspect my work. I had managed to detach a tiny fragment of dried clot from the blood-stained garment, and this, in a drop of normal saline solution, I now had under the microscope.

“What do you make out, Jervis?” my colleague asked.

“Oval corpuscles with distinct nuclei,” I answered.

“Ah,” said Thorndyke, “that will be good hearing for some poor devil. Have you measured them?”

“Yes. Long diameter one twenty-one hundredth of an inch; short diameter about one thirty-four hundredth of an inch.”

Thorndyke reached down an indexed note-book from a shelf of reference volumes and consulted a table of histological
measurements.

"That would seem to be the blood of a pheasant, then, or it might, more probably, be that of a common fowl." He applied his eye to the microscope and, fitting in the eyepiece micrometer, verified my measurements. He was thus employed when a sharp tap was heard on the outer door, and rising to open it he admitted the superintendent.

"I see you are at work on my little problem, doctor," said the latter, glancing at the microscope. "What do you make of that stain?"

"It is the blood of a bird—probably a pheasant, or perhaps a common fowl."

The superintendent slapped his thigh. "Well, I'm hanged!" he exclaimed. "You're a regular wizard, doctor, that's what you are. The fellow said he got that stain through handling a wounded pheasant and here are you able to tell us yes or no without a hint from us to help you. Well, you've done my little job for me, sir, and I'm much obliged to you; now I'll carry out my part of the bargain." He opened a hand-bag and drew forth a wooden frame and a blue foolscap envelope and laid them with extreme care on the table.

"There you are, sir," said he, pointing to the frame; "you will find Mr. Belfield's trade-mark very neatly executed, and in the envelope is the finger-print sheet for comparison."

Thorndyke took up the frame and examined it. It enclosed two sheets of glass, one being the portion of the window-pane and the other a cover-glass to protect the fingerprints. Laying a sheet of white paper on the table, where the light was strongest, Thorndyke held the frame over it and gazed at the glass in silence, but with that faint lighting up of his impassive face which I knew so well and which meant so much to me. I walked round, and looking over his shoulder saw upon the glass the beautifully distinct imprints of four fingers and a thumb—the finger-tips, in fact, of an open hand.

After regarding the frame attentively for some time, Thorndyke produced from his pocket a little wash-leather bag, from which he extracted a powerful doublet lens, and with the aid of this he again explored the finger-prints, dwelling especially upon the print of the forefinger.

"I don't think you will find much amiss with those finger-prints, doctor," said the superintendent, "they are as clear as if he made them on purpose."

"They are indeed," replied Thorndyke, with an inscrutable smile, "exactly as if he had made them on purpose. And how beautifully clean the glass is—as if he had polished it before making the impression."

The superintendent glanced at Thorndyke with quick suspicion; but the smile had faded and given place to a wooden immobility from which nothing could be gleaned.

When he had examined the glass exhaustively, Thorndyke drew the finger-print form from its envelope and scanned it quickly, glancing repeatedly from the paper to the glass and from the glass to the paper. At length he laid them both on the table, and turning to the detective looked him steadily in the face.

"I think, Miller," said he, "that I can give you a hint."

"Indeed, sir? And what might that be?"

"It is this: you are after the wrong man."

The superintendent snorted—not a loud snort, for that would have been rude, and no officer could be more polite than Superintendent Miller. But it conveyed a protest which he speedily followed up in words.

"You don't mean to say that the prints on that glass are not the finger-prints of Frank Belfield?"

"I say that those prints were not made by Frank Belfield," Thorndyke replied firmly.

"Do you admit, sir, that the finger-prints on the official form were made by him?"

"I have no doubt that they were."

"Well, sir, Mr. Singleton, of the Finger-print Department, has compared the prints on the glass with those on the form and he says they are identical; and I have examined them and I say they are identical."

"Exactly," said Thorndyke; "and I have examined them and I say they are identical—and that therefore those on the glass cannot have been made by Belfield."

The superintendent snorted again—somewhat louder this time—and gazed at Thorndyke with wrinkled brows.

"You are not pulling my leg, I suppose, sir?" he asked, a little sourly.

"I should as soon think of tickling a porcupine," Thorndyke answered, with a suave smile.

"Well," rejoined the bewildered detective, "if I didn't know you, sir, I should say you were talking confounded nonsense. Perhaps you wouldn't mind explaining what you mean."

"Supposing," said Thorndyke, "I make it clear to you that those prints on the window-pane were not made by Belfield. Would you still execute the warrant?"

"What do you think?" exclaimed Miller. "Do you suppose we should go into court to have you come and knock the bottom out of our case, like you did in that Hornby affair? By the way, that was a finger-print case too, now I come to think
of it,” and the superintendent suddenly became thoughtful.

“You have often complained,” pursued Thorndyke, “that I have withheld information from you and sprung unexpected evidence on you at the trial. Now I am going to take you into my confidence, and when I have proved to you that this clue of yours is a false one, I shall expect you to let this poor devil Belfield go his way in peace.”

The superintendent grunted—a form of utterance that committed him to nothing.

“These prints,” continued Thorndyke, taking up the frame once more, “present several features of interest, one of which, at least, ought not to have escaped you and Mr. Singleton, as it seems to have done. Just look at that thumb.”

The superintendent did so, and then pored over the official paper.

“Well,” he said, “I don’t see anything the matter with it. It’s exactly like the print on the paper.”

“Of course it is,” rejoined Thorndyke, “and that is just the point. It ought not to be. The print of the thumb on the paper was taken separately from the fingers. And why? Because it was impossible to take it at the same time. The thumb is in a different plane from the fingers; when the hand is laid flat on any surface—as this window-pane, for instance—the palmar surfaces of the fingers touch it, whereas it is the side of the thumb which comes in contact and not the palmar surface. But in this”—he tapped the framed glass with his finger—“the prints show the palmar surfaces of all the five digits in contact at once, which is an impossibility. Just try to put your own thumb in that position and you will see that it is so.”

The detective spread out his hand on the table and immediately perceived the truth of my colleague’s statement.

“And what does that prove?” he asked.

“It proves that the thumb-print on the window-pane was not made at the same time as the finger-prints—that it was added separately; and that fact seems to prove that the prints were not made accidentally, but—as you ingeniously suggested just now—were put there for a purpose.”

“I don’t quite see the drift of all this,” said the superintendent, rubbing the back of his head perplexedly; “and you said a while back that the prints on the glass can’t be Belfield’s because they are identical with the prints on the form. Now that seems to me sheer nonsense, if you will excuse my saying so.”

“And yet,” replied Thorndyke, “it is the actual fact. Listen: these prints”—here he took up the official sheet—“were taken at Holloway six years ago. These”—pointing to the framed glass—“were made within the present week. The one is, as regards the ridge-pattern, a perfect duplicate of the other. Is that not so?”

“That is so, doctor,” agreed the superintendent.

“Well. Now suppose I were to tell you that within the last twelve months something had happened to Belfield that made an appreciable change in the ridge-pattern on one of his fingers?”

“But is such a thing possible?”

“It is not only possible but it has happened. I will show you.”

He brought forth from the drawer the cards on which Belfield had made his finger-prints, and laid them before the detective.

“Observe the prints of the forefinger,” he said, indicating them; “there are a dozen, in all, and you will notice in each a white line crossing the ridges and dividing them. That line is caused by a scar, which has destroyed a portion of the ridges, and is now an integral part of Belfield’s finger-print. And since no such blank line is to be seen in this print on the glass—in which the ridges appear perfect, as they were before the injury—it follows that that print could not have been made by Belfield’s finger.”

“There is no doubt about the injury, I suppose?”

“None whatever. There is the scar to prove it, and I can produce the surgeon who attended Belfield at the time.”

The officer rubbed his head harder than before, and regarded Thorndyke with puckered brows.

“This is a teaser,” he growled, “it is indeed. What you say, sir, seems perfectly sound, and yet—there are those finger-prints on the window-glass. Now you can’t get fingerprints without fingers, can you?”

“Undoubtedly you can,” said Thorndyke.

“I should want to see that done before I could believe even you, sir,” said Miller.

“You shall see it done now,” was the calm rejoinder. “You have evidently forgotten the Hornby case—the case of the Red Thumb-mark, as the newspapers called it.”

“I only heard part of it,” replied Miller, “and I didn’t really follow the evidence in that.”

“Well, I will show you a relic of that case,” said Thorndyke. He unlocked a cabinet and took from one of the shelves a small box labelled “Hornby,” which, being opened, was seen to contain a folded paper, a little red-covered oblong book and what looked like a large boxwood pawn.

“This little book,” Thorndyke continued, “is a ‘thumb-ograph’—a sort of finger-print album—I dare say you know the kind of thing.”
The superintendent nodded contemptuously at the little volume.

“Now while Dr. Jervis is finding us the print we want, I will run up to the laboratory for an inked slab.”

He handed me the little book and, as he left the room, I began to turn over the leaves—not without emotion, for it was this very “thumbograph” that first introduced me to my wife, as is related elsewhere—glancing at the various prints above the familiar names and marvelling afresh at the endless variations of pattern that they displayed. At length I came upon two thumb-prints of which one—the left—was marked by a longitudinal white line—evidently the trace of a scar; and underneath them was written the signature “Reuben Hornby.”

At this moment Thorndyke re-entered the room carrying the inked slab, which he laid on the table, and seating himself between the superintendent and me, addressed the former.

“Now, Miller, here are two thumb-prints made by a gentleman named Reuben Hornby. Just glance at the left one; it is a highly characteristic print.”

“Yes,” agreed Miller, “one could swear to that from memory, I should think.”

“Then look at this.” Thorndyke took the paper from the box and, unfolding it, handed it to the detective. It bore a pencilled inscription, and on it were two blood-smears and a very distinct thumb-print in blood. “What do you say to that thumb-print?”

“Why,” answered Miller, “it’s this one, of course; Reuben Hornby’s left thumb.”

“Wrong, my friend,” said Thorndyke. “It was made by an ingenious gentleman named Walter Hornby (whom you followed from the Old Bailey and lost on Ludgate Hill); but not with his thumb.”

“How, then?” demanded the superintendent incredulously.

“In this way.” Thorndyke took the boxwood “pawn” from its receptacle and pressed its flat base onto the inked slab; then lifted it and pressed it onto the back of a visiting-card, and again raised it; and now the card was marked by a very distinct thumb-print.

“My God!” exclaimed the detective, picking up the card and viewing it with a stare of dismay, “this is the very devil, sir. This fairly knocks the bottom out of finger-print identification. May I ask, sir, how you made that stamp—for I suppose you did make it?”

“Yes, we made it here, and the process we used was practically that used by photo-engravers in making line blocks; that is to say, we photographed one of Mr. Hornby’s thumb-prints, printed it on a plate of chrome-gelatine, developed the plate with hot water and this”—here he touched the embossed surface of the stamp—“is what remained. But we could have done it in various other ways; for instance, with common transfer paper and lithographic stone; indeed, I assure you, Miller, that there is nothing easier to forge than a finger-print, and it can be done with such perfection that the forger himself cannot tell his own forgery from a genuine original, even when they are placed side by side.”

“Well, I’m hanged,” grunted the superintendent, “you’ve fairly knocked me, this time, doctor.” He rose gloomily and prepared to depart. “I suppose,” he added, “your interest in this case has lapsed, now Belfield’s out of it?”

“Professionally, yes; but I am disposed to finish the case for my own satisfaction. I am quite curious as to who our too-ingenious friend may be.”

Miller’s face brightened. “We shall give you every facility, you know—and that reminds me that Singleton gave me these two photographs for you, one of the official paper and one of the prints on the glass. Is there anything more that we can do for you?”

“I should like to have a look at the room in which the murder took place.”

“You shall, doctor; to-morrow, if you like; I’ll meet you there in the morning at ten, if that will do.”

It would do excellently, Thorndyke assured him, and with this the superintendent took his departure in renewed spirits.

We had only just closed the door when there came a hurried and urgent tapping upon it, whereupon I once more threw it open, and a quietly-dressed woman in a thick veil, who was standing on the threshold, stepped quickly past me into the room.

“Where is my husband?” she demanded, as I closed the door; and then, catching sight of Thorndyke, she strode up to him with a threatening air and a terrified but angry face.

“What have you done with my husband, sir?” she repeated. “Have you betrayed him, after giving your word? I met a man who looked like a police officer on the stairs.”

“Your husband, Mrs. Belfield, is here and quite safe,” replied Thorndyke. “He has locked himself in that room,” indicating the office.

Mrs. Belfield darted across and rapped smartly at the door. “Are you there, Frank?” she called.

In immediate response the key turned, the door opened and Belfield emerged looking very pale and worn.

“You have kept me a long time in there, sir,” he said.
“It took me a long time to prove to Superintendent Miller that he was after the wrong man. But I succeeded, and now, Belfield, you are free. The charge against you is withdrawn.”

Belfield stood for a while as one stupefied, while his wife, after a moment of silent amazement, flung her arms round his neck and burst into tears. “But how did you know I was innocent, sir?” demanded the bewildered Belfield.

“Aha! how did I? Every man to his trade, you know. Well, I congratulate you, and now go home and have a square meal and get a good night’s rest.”

He shook hands with his clients—vainly endeavouring to prevent Mrs. Belfield from kissing his hand—and stood at the open door listening until the sound of their retreating footsteps died away.

“A noble little woman, Jervis,” said he, as he closed the door. “In another moment she would have scratched my face—and I mean to find out the scoundrel who tried to wreck her happiness.”

THE case which I am now about to describe has always appeared to me a singularly instructive one, as illustrating the value and importance of that fundamental rule in the carrying out of investigations which Thorndyke had laid down so emphatically—the rule that all facts, in any way relating to a case, should be collected impartially and without reference to any theory, and each fact, no matter how trivial or apparently irrelevant, carefully studied. But I must not anticipate the remarks of my learned and talented friend on this subject which I have to chronicle anon; rather let me proceed to the case itself.

I had slept at our chambers in King’s Bench Walk—as I commonly did two or three nights a week—and on coming down to the sitting-room, found Thorndyke’s man, Polton, putting the last touches to the breakfast-table, while Thorndyke himself was poring over two photographs of fingerprints, of which he seemed to be taking elaborate measurements with a pair of hair-dividers. He greeted me with his quiet, genial smile and, laying down the dividers, took his seat at the breakfast-table.

“You are coming with me this morning, I suppose,” said he; “the Camberwell murder case, you know.”

“Of course I am if you will have me, but I know practically nothing of the case. Could you give me an outline of the facts that are known?”

Thorndyke looked at me solemnly, but with a mischievous twinkle. “This,” he said, “is the old story of the fox and the crow; you ‘bid me discourse,’ and while I ‘enchant thine ear,’ you claw to windward with the broiled ham. A deep-laid plot, my learned brother.”

“And such,” I exclaimed, “is the result of contact with the criminal classes!”

“I am sorry that you regard yourself in that light,” he retorted, with a malicious smile. “However, with regard to this case. The facts are briefly these: The murdered man, Caldwell, who seems to have been formerly a receiver of stolen goods and probably a police spy as well, lived a solitary life in a small house with only an elderly woman to attend him.

“A week ago this woman went to visit a married daughter and stayed the night with her, leaving Caldwell alone in the house. When she returned on the following morning she found her master lying dead on the floor of his office, or study, in a small pool of blood.

“The police surgeon found that he had been dead about twelve hours. He had been killed by a single blow, struck from behind, with some heavy implement, and a jemmy which lay on the floor beside him fitted the wound exactly. The deceased wore a dressing-gown and no collar, and a bedroom candlestick lay upside down on the floor, although gas was laid on in the room; and as the window of the office appears to have been forced with the jemmy that was found, and there were distinct footprints on the flower-bed outside the window, the police think that the deceased was undressing to go to bed when he was disturbed by the noise of the opening window; that he went down to the office and, as he entered, was struck down by the burglar who was lurking behind the door. On the window-glass the police found the greasy impression of an open right hand, and, as you know, the finger-prints were identified by the experts as those of an old convict named Belfield. As you also know, I proved that those finger-prints were, in reality, forgeries, executed with rubber or gelatine stamps. That is an outline of the case.”

The close of this recital brought our meal to an end, and we prepared for our visit to the scene of the crime. Thorndyke slipped into his pocket his queer outfit—somewhat like that of a field geologist—locked up the photographs, and we set forth by way of the Embankment.

“The police have no clue, I suppose, to the identity of the murderer, now that the finger-prints have failed?” I asked, as we strode along together.

“I expect not,” he replied, “though they might have if they examined their material. I made out a rather interesting point this morning, which is this: the man who made those sham finger-prints used two stamps, one for the thumb and the other for the four fingers; and the original from which those stamps were made was the official finger-print form.”

“How did you discover that?” I inquired.

“It was very simple. You remember that Mr. Singleton of the Finger-print Department sent me, by Superintendent
Miller, two photographs, one of the prints on the window and one of the official form with Belfield's finger-prints on it. Well, I have compared them and made the most minute measurements of each, and they are obviously duplicates. Not only are all the little imperfections on the form—due to defective inking—reproduced faithfully on the window-pane, but the relative positions of the four fingers on both cases agree to the hundredth of an inch. Of course the thumb stamp was made by taking an oval out of the rolled impression on the form."

"Then do you suggest that this murder was committed by someone connected with the Finger-print Department at Scotland Yard?"

"Hardly. But someone has had access to the forms. There has been leakage somewhere."

When we arrived at the little detached house in which the murdered man had lived, the door was opened by an elderly woman, and our friend, Superintendent Miller, greeted us in the hall.

"We are all ready for you, doctor," said he. "Of course, the things have all been gone over once, but we are turning them out more thoroughly now." He led the way into the small, barely-furnished office in which the tragedy had occurred. A dark stain on the carpet and a square hole in one of the window-panes furnished memorials of the crime, which were supplemented by an odd assortment of objects laid out on the newspaper-covered table. These included silver teaspoons, watches, various articles of jewellery, from which the stones had been removed—none of them of any considerable value—and a roughly-made jemmy.

"I don't know why Caldwell should have kept all these odds and ends," said the detective superintendent. "There is stuff here, that I can identify, from six different burglaries—and not a conviction among the six."

Thorndyke looked over the collection with languid interest; he was evidently disappointed at finding the room so completely turned out.

"Have you any idea what has been taken?" he asked.

"Not the least. We don't even know if the safe was opened. The keys were on the writing-table, so I suppose he went through everything, though I don't see why he left these things if he did. We found them all in the safe."

"Have you powdered the jemmy?"

The superintendent turned very red. "Yes," he growled, "but some half-dozen blithering idiots had handled the thing before I saw it—been trying it on the window, the blighters—so, of course, it showed nothing but the marks of their beastly paws."

"The window had not really been forced, I suppose?" said Thorndyke.

"No," replied Miller, with a glance of surprise at my colleague, "that was a plant; so were the footprints. He must have put on a pair of Caldwell's boots and gone out and made them—unless Caldwell made them himself, which isn't likely."

"Have you found any letter or telegram?"

"A letter making an appointment for nine o'clock on the night of the murder. No signature or address, and the handwriting evidently disguised."

"Is there anything that furnishes any sort of clue?"

"Yes, sir, there is. There's this, which we found in the safe." He produced a small parcel which he proceeded to unfasten, looking somewhat queerly at Thorndyke the while. It contained various odds and ends of jewellery, and a smaller parcel formed of a pocket-handkerchief tied with tape. This the detective also unfastened, revealing half-a-dozen silver teaspoons, all engraved with the same crest, two salt-cellars and a gold locket bearing a monogram. There was also a half-sheet of note-paper on which was written, in a manifestly disguised hand: "These are the goods I told you about. F. B." But what riveted Thorndyke's attention and mine was the handkerchief itself (which was not a very clean one and was sullied by one or two small blood-stains), for it was marked in one corner with the name "F. Belfield," legibly printed in marking-ink with a rubber stamp.

Thorndyke and the superintendent looked at one another and both smiled.

"I know what you are thinking, sir," said the latter.

"I am sure you do," was the reply, "and it is useless to pretend that you don't agree with me."

"Well, sir," said Miller doggedly, "if that handkerchief has been put there as a plant, it's Belfield's business to prove it. You see, doctor," he added persuasively, "it isn't this job only that's affected. Those spoons, those salt-cellars and that locket are part of the proceeds of the Winchmore Hill burglary, and we want the gentleman who did that crack—we want him very badly."

"No doubt you do," replied Thorndyke, "but this handkerchief won't help you. A sharp counsel—Mr. Anstey, for instance—would demolish it in five minutes. I assure you, Miller, that handkerchief has no evidential value whatever, whereas it might prove an invaluable instrument of research. The best thing you can do is to hand it over to me and let me see what I can learn from it."

The superintendent was obviously dissatisfied, but he eventually agreed, with manifest reluctance, to Thorndyke's suggestion.
“Very well, doctor,” he said; “you shall have it for a day or two. Do you want the spoons and things as well?”

“No. Only the handkerchief and the paper that was in it.”

The two articles were accordingly handed to him and deposited in a tin box which he usually carried in his pocket, and, after a few more words with the disconsolate detective, we took our departure.

“A very disappointing morning,” was Thorndyke’s comment as we walked away. “Of course the room ought to have been examined by an expert before anything was moved.”

“Have you picked up anything in the way of information?” I asked.

“Very little excepting confirmation of my original theory. You see, this man Caldwell was a receiver and evidently a police spy. He gave useful information to the police, and they, in return, refrained from inconvenient inquiries. But a spy, or ‘nark,’ is nearly always a blackmailer too, and the probabilities in this case are that some crook, on whom Caldwell was putting the screw rather too tightly, made an appointment for a meeting when the house was empty, and just knocked Caldwell on the head. The crime was evidently planned beforehand, and the murderer came prepared to kill several birds with one stone. Thus he brought with him the stamps to make the sham finger-prints on the window, and I have no doubt that he also brought this handkerchief and the various oddments of plate and jewellery from those burglaries that Miller is so keen about, and planted them in the safe. You noticed, I suppose, that none of the things were of any value, but all were capable of easy identification?”

“Yes, I noticed that. His object, evidently, was to put those burglaries as well as the murder onto poor Belfield.”

“Exactly. And you see what Miller’s attitude is; Belfield is the bird in the hand, whereas the other man—if there is another—is still in the bush; so Belfield is to be followed up and a conviction obtained if possible. If he is innocent, that is his affair, and it is for him to prove it.”

“And what shall you do next?” I asked.

“I shall telegraph to Belfield to come and see us this evening. He may be able to tell us something about this handkerchief that, with the clue we already have, may put us on the right track. What time is your consultation?”

“Twelve-thirty—and there comes my ‘bus.’ I shall be in to lunch.” I sprang onto the footboard, and as I took my seat on the roof and looked back at my friend striding along with an easy swing, I knew that he was deep in thought, though automatically attentive to all that was happening. My consultation—it was a lunacy case of some importance—was over in time to allow of my return to our chambers punctually at the luncheon hour; and as I entered, I was at once struck by something new in Thorndyke’s manner—a certain elation and gaiety which I had learned to associate with a point scored successfully in some intricate and puzzling case. He made no confidences, however, and seemed, in fact, inclined to put away, for a time, all his professional cares and business.

“Shall we have an afternoon off, Jervis?” he said gaily. “It is a fine day and work is slack just now. What say you to the Zoo? They have a splendid chimpanzee and several specimens of that remarkable fish Periophthalmus Kolreuteri. Shall we go?”

“By all means,” I replied; “and we will mount the elephant, if you like, and throw buns to the grizzly bear and generally renew our youth like the eagle.”

But when, an hour later, we found ourselves in the gardens, I began to suspect my friend of some ulterior purpose in this holiday jaunt; for it was not the chimpanzee or even the wonderful fish that attracted his attention. On the contrary, he hung about the vicinity of the lamas and camels in a way that I could not fail to notice; and even there it appeared to be the sheds and houses rather than the animals themselves that interested him.

“Behold, Jervis,” he said presently, as a saddled camel of seedy aspect was led towards its house, “behold the ship of the desert, with raised saloon-deck amidships, fitted internally with watertight compartments and displaying the effects of rheumatoid arthritis in its starboard hip-joint. Let us go and examine him before he hauls into dock.” We took a cross-path to intercept the camel on its way to its residence, and Thorndyke moralized as we went.

“It is interesting,” he remarked, “to note the way in which these specialized animals, such as the horse, the reindeer and the camel, have been appropriated by man, and their special character made to subserve human needs. Think, for instance, of the part the camel has played in history, in ancient commerce—and modern too, for that matter—and in the diffusion of culture; and of the role he has enacted in war and conquest from the Egyptian campaign of Cambyses down to that of Kitchener. Yes, the camel is a very remarkable animal, though it must be admitted that this particular specimen is a scurvy-looking beast.”

The camel seemed to be sensible of these disparaging remarks, for as it approached it saluted Thorndyke with a supercilious grin and then turned away its head.

“Your charge is not as young as he used to be,” Thorndyke observed to the man who was leading the animal.

“No, sir, he isn’t; he’s getting old, and that’s the fact. He shows it too.”

“I suppose,” said Thorndyke, strolling towards the house by the man’s side, “these beasts require a deal of attention?”

“You’re right, sir; and nasty-tempered brutes they are.”
“So I have heard; but they are interesting creatures, the camels and lamas. Do you happen to know if complete sets of photographs of them are to be had here?”

“You can get a good many at the lodge, sir,” the man replied, “but not all, I think. If you want a complete set, there’s one of our men in the camel-house that could let you have them; he takes the photos himself, and very clever he is at it, too. But he isn’t here just now.”

“Perhaps you could give me his name so that I could write to him,” said Thorndyke.

“Yes, sir. His name is Woodthorpe—Joseph Woodthorpe. He’ll do anything for you to order. Thank you, sir; good-afternoon, sir;” and pocketing an unexpected tip, the man led his charge towards its lair.

Thorndyke’s absorbing interest in the camels seemed now suddenly to become extinct, and he suffered me to lead him to any part of the gardens that attracted me, showing an imperial interest in all the inmates from the insects to the elephants, and enjoying his holiday—if it was one—with the gaiety and high spirits of a schoolboy. Yet he never let slip a chance of picking up a stray hair or feather, but gathered up each with care, wrapped it in its separate paper, on which was written its description, and deposited it in his tin collecting-box.

“You never know,” he remarked, as we turned away from the ostrich enclosure, “when a specimen for comparison may be of vital importance. Here, for instance, is a small feather of a cassowary, and here the hair of a wapiti deer; now the recognition of either of those might, in certain circumstances, lead to the detection of a criminal or save the life of an innocent man. The thing has happened repeatedly, and may happen again to-morrow.”

“You must have an enormous collection of hairs in your cabinet,” I remarked, as we walked home.

“I have,” he replied, “probably the largest in the world. And as to other microscopical objects of medico-legal interest, such as dust and mud from different localities and from special industries and manufactures, fibres, food-products and drugs, my collection is certainly unique.”

“And you have found your collection useful in your work?” I asked.

“Constantly. Over and over again I have obtained, by reference to my specimens, the most unexpected evidence, and the longer I practise, the more I become convinced that the microscope is the sheet-anchor of the medical jurist.”

“By the way,” I said, “you spoke of sending a telegram to Belfield. Did you send it?”

“Yes. I asked him to come to see me to-night at half-past eight, and, if possible, bring his wife with him. I want to get to the bottom of that handkerchief mystery.”

“But do you think he will tell you the truth about it?”

“That is impossible to judge; he will be a fool if he does not. But I think he will; he has a godly fear of me and my methods.”

As soon as our dinner was finished and cleared away, Thorndyke produced the “collecting-box” from his pocket, and began to sort out the day’s “catch,” giving explicit directions to Polton for the disposal of each specimen. The hairs and small feathers were to be mounted as microscopic objects, while the larger feathers were to be placed, each in its separate labelled envelope, in its appropriate box. While these directions were being given, I stood by the window absently gazing out as I listened, gathering many a useful hint in the technique of preparation and preservation, and filled with admiration alike at my colleague’s exhaustive knowledge of practical detail and the perfect manner in which he had trained his assistant. Suddenly I started, for a well-known figure was crossing from Crown Office Row and evidently bearing down on our chambers.

“My word, Thorndyke,” I exclaimed, “here’s a pretty mess!”

“What is the matter?” he asked, looking up anxiously.

“Superintendent Miller heading straight for our doorway. And it is now twenty minutes past eight.”

Thorndyke laughed. “It will be a quaint position,” he remarked, “and somewhat of a shock for Belfield. But it really doesn’t matter; in fact, I think, on the whole, I am rather pleased that he should have come.”

The superintendent’s brisk knock was heard a few moments later, and when he was admitted by Polton, he entered and looked round the room a little, sheepishly.

“I am ashamed to come worrying you like this, sir,” he began apologetically.

“Not at all,” replied Thorndyke, serenely slipping the cassowary’s feather into an envelope, and writing the name, date and locality on the outside. “I am your servant in this case, you know. Polton, whisky and soda for the superintendent.”

“You see, sir,” continued Miller, “our people are beginning to fuss about this case, and they don’t approve of my having handed that handkerchief and the paper over to you as they will have to be put in evidence.”

“I thought they might object,” remarked Thorndyke.

“So did I, sir; and they do. And, in short, they say that I have got to get them back at once. I hope it won’t put you out, sir.”
“Not in the least,” said Thorndyke. “I have asked Belfield to come here to-night—I expect him in a few minutes—and when I have heard what he has to say I shall have no further use for the handkerchief.”

“You’re not going to show it to him!” exclaimed the detective, aghast.

“Certainly I am.”

“You mustn’t do that, sir. I can’t sanction it; I can’t indeed.”

“Now, look you here, Miller,” said Thorndyke, shaking his forefinger at the officer; “I am working for you in this case, as I have told you. Leave the matter in my hands. Don’t raise silly objections; and when you leave here tonight you will take with you not only the handkerchief and the paper, but probably also the name and address of the man who committed this murder and those various burglaries that you are so keen about.”

“Is that really so, sir?” exclaimed the astonished detective. “Well, you haven’t let the grass grow under your feet. Ah!” as a gentle rap at the door was heard, “here’s Belfield, I suppose.”

It was Belfield—accompanied by his wife—and mightily disturbed they were when their eyes lighted on our visitor.

“You needn’t be afraid of me, Belfield,” said Miller, with ferocious geniality; “I am there after you.” Which was not literally true, though it served to reassure the affrighted ex-convict.

“The superintendent dropped in by chance,” said Thorndyke; “but it is just as well that he should hear what passes. I want you to look at this handkerchief and tell me if it is yours. Don’t be afraid, but just tell us the simple truth.”

He took the handkerchief out of a drawer and spread it on the table; and I now observed that a small square had been cut out of one of the bloodstains.

Belfield took the handkerchief in his trembling hands, and as his eye fell on the stamped name in the corner he turned deadly pale.

Mrs. Belfield examined first the name and then the hem. “It’s yours, right enough, Frank,” said she. “It’s the one that got changed in the wash. You see, sir,” she continued, addressing Thorndyke, “I bought him half-a-dozen new ones about six months ago, and I got a rubber stamp made and marked them all. Well, one day when I was looking over his things I noticed that one of his handkerchiefs had got no mark on it. I spoke to the laundress about it, but she couldn’t explain it, so as the right one never came back, I marked the one that we got in exchange.”

“How long ago was that?” asked Thorndyke.

“About two months ago I noticed it.”

“And you know nothing more about it.”

“Nothing whatever, sir. Nor you, Frank, do you?”

Her husband shook his head gloomily, and Thorndyke replaced the handkerchief in the drawer.

“And now,” said he, “I am going to ask you a question on another subject. When you were at Holloway there was a warder—or assistant warder—there, named Woodthorpe. Do you remember him?”

“Yes, sir, very well indeed; in fact, it was him that—?”

“I know,” interrupted Thorndyke. “Have you seen him since you left Holloway?”

“Yes, sir, once. It was last Easter Monday. I met him at the Zoo; he is a keeper there now in the camel-house” (here a sudden light dawned upon me and I chuckled aloud, to Belfield’s great astonishment). “He gave my little boy a ride on one of the camels and made himself very pleasant.”

“But do you remember anything else happening?” Thorndyke inquired.

“Yes, sir. The camel had a little accident; he kicked out—he was an ill-tempered beast—and his leg hit a post; there happened to be a nail sticking out from that post, and it tore up a little flap of skin. Then Woodthorpe got out his handkerchief to tie up the wound, but as it was none of the cleanest, I said to him: ‘Don’t use that, Woodthorpe; have mine,’ which was quite a clean one. So he took it and bound up the camel’s leg, and he said to me: ‘I’ll have it washed and send it to you if you give me your address.’ But I told him there was no need for that; I should be passing the camel-house on my way out and I would look in for the handkerchief. And I did: I looked in about an hour later, and Woodthorpe gave me my handkerchief, folded up but not washed.”

“Did you examine it to see if it was yours?” asked Thorndyke.

“No, sir. I just slipped it in my pocket as it was.”

“And what became of it afterwards?”

“When I got home I dropped it into the dirty-linen basket.”

“Is that all you know about it?”

“Yes, sir; that is all I know.”
"Very well, Belfield, that will do. Now you have no reason to be uneasy. You will soon know all about the Camberwell murder—that is, if you read the papers."

The ex-convict and his wife were obviously relieved by this assurance and departed in quite good spirits. When they were gone, Thorndyke produced the handkerchief and the half-sheet of paper and handed them to the superintendent, remarking—"This is highly satisfactory, Miller; the whole case seems to join up very neatly indeed. Two months ago the wife first noticed the substituted handkerchief, and last Easter Monday—a little over two months ago—this very significant incident took place in the Zoological Gardens."

"That is all very well, sir," objected the superintendent, "but we've only their word for it, you know."

"Not so," replied Thorndyke. "We have excellent corroborative evidence. You noticed that I had cut a small piece out of the blood-stained portion of the handkerchief?"

"Yes; and I was sorry you had done it. Our people won't like that."

"Well, here it is, and we will ask Dr. Jervis to give us his opinion of it."

From the drawer in which the handkerchief had been hidden he brought forth a microscope slide, and setting the microscope on the table, laid the slide on the stage.

"Now, Jervis," he said, "tell us what you see there."

I examined the edge of the little square of fabric (which had been mounted in a fluid reagent) with a high-power objective, and was, for a time, a little puzzled by the appearance of the blood that adhered to it.

"It looks like bird's blood," I said presently, with some hesitation, "but yet I can make out no nuclei." I looked again, and then, suddenly, "By Jove!" I exclaimed. "I have it; of course! It's the blood of a camel!"

"Is that so, doctor?" demanded the detective, leaning forward in his excitement.

"That is so," replied Thorndyke. "I discovered it after I came home this morning. You see," he explained, "it is quite unmistakable. The rule is that the blood corpuscles of mammals are circular; the one exception is the camel family, in which the corpuscles are elliptical."

"Why," exclaimed Miller, "that seems to connect Woodthorpe with this Camberwell job."

"It connects him with it very conclusively," said Thorndyke. "You are forgetting the finger-prints."

The detective looked puzzled. "What about them?" he asked.

"They were made with stamps—two stamps, as a matter of fact—and those stamps were made by photographic process from the official finger-print form. I can prove that beyond all doubt."

"Well, suppose they were. What then?"

Thorndyke opened a drawer and took out a photograph, which he handed to Miller. "Here," he said, "is the photograph of the official finger-print form which you were kind enough to bring me. What does it say at the bottom there?" and he pointed with his finger.

The superintendent read aloud: "Impressions taken by Joseph Woodthorpe. Rank, Warder; Prison, Holloway." He stared at the photograph for a moment, and then exclaimed—"Well, I'm hanged! You have worked this out neatly, doctor! and so quick too. We'll have Mr. Woodthorpe under lock and key the first thing to-morrow morning. But how did he do it, do you think?"

"He might have taken duplicate finger-prints and kept one form; the prisoners would not know there was anything wrong; but he did not in this case. He must have contrived to take a photograph of the form before sending it in—it would take a skilful photographer only a minute or two with a suitable hand-camera placed on a table at the proper distance from the wall; and I have ascertained that he is a skilful photographer. You will probably find the apparatus, and the stamps too, when you search his rooms."

"Well, well. You do give us some surprises, doctor. But I must be off now to see about this warrant. Good-night, sir, and many thanks for your help."

When the superintendent had gone we sat for a while looking at one another in silence. At length Thorndyke spoke. "Here is a case, Jervis," he said, "which, simple as it is, teaches a most invaluable lesson—a lesson which you should take well to heart. It is this: The evidential value of any fact is an unknown quantity until the fact has been examined. That seems a self-evident truth, but like many other self-evident truths, it is constantly overlooked in practice. Take this present case. When I left Caldwell's house this morning the facts in my possession were these: (1) The man who murdered Caldwell was directly or indirectly connected with the Finger-print Department. (2) He was almost certainly a skilful photographer. (3) He probably committed the Winchmore Hill and the other burglaries. (4) He was known to Caldwell, had had professional dealings with him and was probably being blackmailed. This was all; a very vague clue, as you see.

"There was the handkerchief, planted, as I had no doubt; but could not prove; the name stamped on it was Belfield's, but any one can get a rubber stamp made. Then it was stained with blood, as handkerchiefs often are; that blood might or might not be human blood; it did not seem to matter a straw whether it was or not. Nevertheless, I said to myself: If it is human, or at least mammalian blood, that is a fact; and if it is not human blood, that is also a fact. I will have that fact, and
then I shall know what its value is. I examined the stain when I reached home, and behold! it was camel’s blood; and immediately this insignificant fact swelled up into evidence of primary importance. The rest was obvious. I had seen Woodthorpe’s name on the form, and I knew several other officials. My business was to visit all places in London where there were camels, to get the names of all persons connected with them and to ascertain if any among them was a photographer. Naturally I went first to the Zoo, and at the very first cast hooked Joseph Woodthorpe. Wherefore I say again: Never call any fact irrelevant until you have examined it."

The remarkable evidence given above was not heard at the trial, nor did Thorndyke’s name appear among the witnesses; for when the police searched Woodthorpe’s rooms, so many incriminating articles were found (including a pair of fingerprint stamps which exactly answered to Thorndyke’s description of them, and a number of photographs of fingerprint forms) that his guilt was put beyond all doubt; and society was shortly after relieved of a very undesirable member.

THE END
31 NEW INN

I. — THE MYSTERIOUS PATIENT

THE hour of nine was approaching—the blessed hour of release when the casual patient ceases from troubling (or is expected to do so) and the weary practitioner may put on his slippers and turn down the surgery gas.

The fact was set forth with needless emphasis by the little American clock on the mantel-shelf, which tick-tacked frantically, as though it were eager to get the day over and be done with it; indeed, the approaching hour might have been ninety-nine from the to-do the little clock made about the matter.

The minute-hand was creeping up to the goal and the little clock had just given a kind of preliminary cough to announce its intention of striking the hour, when the bell on the door of the outer surgery rang to announce the arrival of a laggard visitor. A moment later the office-boy thrust his head in at my door and informed me that a gentleman wished to see me.

They were all gentlemen in Kennington Lane—unless they were ladies or children. Sweeps, milkmen, bricklayers, costermongers, all were impartially invested with rank and title by the democratic office-boy, and I was not, therefore, surprised or disappointed when the open door gave entrance to a man in the garb of a cabman or coachman.

As he closed the door behind him, he drew from his coat pocket a note, which he handed to me without remark. It was not addressed to me, but to my principal—to the doctor, that is to say, of whose practise I was taking charge to see me.

"You understand, I suppose," I said, as I prepared to open the envelope, "that I am not Dr. Pike? He is out of town at present, and I am looking after his patients."

"It's of no consequence," the man replied. "You'll do just as well as him, I expect."

On this I opened the note and read the contents, which were quite brief and, at first sight, in no way remarkable.

Dear Sir:

Could you come at once and see my brother? The bearer of this will give you further particulars and convey you to the house.

Yours truly,

J. Morgan.

There was no address on the paper and no date, and the name of the writer was, of course, unknown to me.

"This note speaks of some further particulars," I said to the messenger. "What are the particulars referred to?"

"Why, sir, the fact is," he replied, "it's a most ridiculous affair altogether. The sick gentleman don't seem to me to be quite right in his head; at any rate, he's got some very peculiar ideas. He's been ailing now for some time, and the master, Mr. Morgan, has tried everything he knew to get him to see a doctor. But he wouldn't. However, at last it seems he gave way, but only on one condition. He said the doctor was to come from a distance and was not to be told who he was or where he lived or anything about him; and he made the master promise to keep to these conditions before he would let him send for advice. Do you think you could come and see him on these conditions, sir?"

I considered the question for a while before replying. We doctors all know the kind of idiot who is possessed with an insatiable dislike and distrust of the members of our profession and we like to have as little to do with him as possible. If this had been my own practise I would have declined the case off-hand; but I could not lightly refuse work that would bring profit to my principal.

As I turned the matter over in my mind I half-unconsciously scrutinized my visitor—rather to his embarrassment—and I liked his appearance as little as I liked his message. He kept his hat on, which I resented, and he stood near the door where the light was dim, for the illumination was concentrated on the table and the patient's chair; but I could see that he had a sly, unprepossessing face and a greasy red mustache that seemed out of character with his livery, though this was mere prejudice. Moreover, his voice was disagreeable, having that dull, snuffling quality that, to the medical ear, suggests a nasal polypus. Altogether I was unpleasantly impressed, but decided, nevertheless, to undertake the case.

"I suppose," I answered at length, "it is no affair of mine who the sick man is or where he lives; but how do you propose to manage the business? Am I to be blindfolded like the visitor to the bandits' cave?"

"No, sir," he replied with a forced smile and with evident relief at my agreement. "I have a carriage waiting to take you."

"Very well," I rejoined, opening the door to let him out, "I will be with you in a minute."

I slipped into a bag a small supply of emergency drugs and a few diagnostic instruments, turned down the gas and passed out through the surgery. The carriage was standing by the curb and I viewed it with mingled curiosity and disfavor; it was a kind of large brougham, such as is used by some commercial travelers, the usual glass windows being replaced by wooden shutters intended to conceal the piles of sample-boxes, and the doors capable of being locked from outside.

As I emerged, the coachman unlocked the door and held it open.

"How long will the journey take?" I asked, pausing with my foot on the step.
"Nigh upon half an hour," was the reply.

I glanced at my watch and, reflecting gloomily that my brief hour of leisure would be entirely absorbed by this visit, stepped into the uninviting vehicle. Instantly the coachman slammed the door and turned the key, leaving me in total darkness.

As the carriage rattled along, now over the macadam of quiet side-streets and now over the granite of the larger thoroughfares, I meditated on the oddity of this experience and on the possible issues of the case. For one moment a suspicion arose in my mind that this might be a trick to lure me to some thieves' den where I might be robbed and possibly murdered; but I immediately dismissed this idea, reflecting that so elaborate a plan would not have been devised for so unremunerative a quarry as an impecunious general practitioner.
II. — I MEET MR. MORGAN

MY reflections were at length brought to an end by the carriage slowing down and passing under an archway—as I could tell by the hollow sound—where it presently stopped. Then I distinguished the clang of heavy wooden gates closed behind me, and a moment later the carriage door was unlocked and opened. I stepped out into a covered way that seemed to lead down to a stable; but it was all in darkness and I had no time to make any detailed observations, for the carriage had drawn up opposite a side door which was open, and in which stood an elderly woman holding a candle.

"Is that the doctor?" she inquired, shading the candle with her hand and peering at me with screwed-up eyes. Then, with evident relief: "I am glad you have come, sir. Will you please to step in?"

I followed her across a dark passage into a large room almost destitute of furniture, where she set down the candle on a chest of drawers and turned to depart.

"The master will see you in a moment," she said. "I will go and tell him you are here."

With that she left me in the twilight of the solitary candle to gaze curiously at the bare and dismal apartment with its three rickety chairs, its unswept floor, its fast-closed shutters and the dark drapery of cobwebs that hung from the ceiling to commemorate a long and illustrious dynasty of spiders.

Presently the door opened and a shadowy figure appeared, standing close by the threshold.

"Mr. Morgan, I presume?" said I, advancing toward the stranger as he remained standing by the doorway.

"Quite right, sir," he answered, and as he spoke I started, for his voice had the same thick, snuffling quality that I had already noticed in that of the coachman. The coincidence was certainly an odd one, and it caused me to look at the stranger narrowly. He appeared somewhat shorter than his servant, but then he had a pronounced stoop, whereas the coachman was stiff and upright in his carriage; then the coachman had short hair of a light brown and a reddish mustache, whereas this man appeared, so far as I could see in the gloom, to have a shock head of black hair and a voluminous black beard. Moreover he wore spectacles. "Quite right, sir," said this individual, "and I thought I had better give you an outline of the case before you go up to the patient. My brother is, as my man has probably told you, very peculiar in some of his ideas, whence these rather foolish proceedings, for which I trust you will not hold me responsible, though I feel obliged to carry out his wishes. He returned a week or two ago from New York and, being then in rather indifferent health, he asked me to put him up for a time, as he had no settled home of his own. From that time he has gradually become worse and has really caused me a good deal of anxiety, for until now I have been quite unable to prevail on him to seek medical advice. And even now he has only consented subject to the ridiculous conditions that my man has probably explained to you."

"What is the nature of his illness?" I asked. "Does he complain of any definite symptoms?"

"No," was the reply. "Indeed, he makes very few complaints of any kind, although he is obviously ill, but the fact is that he is hardly ever more than half awake. He lies in a kind of dreamy stupor from morning to night."

This struck me as excessively odd and by no means in agreement with the patient's energetic refusal to see a doctor.

"But does he never rouse completely?" I asked.

"Oh, yes," Mr. Morgan answered quickly; "he rouses occasionally and is then quite rational and, as you may have gathered, rather obstinate. But perhaps you had better see for yourself what his condition is. Follow me, please: the stairs are rather dark."

The stairs were very dark and were, moreover, without any covering of carpet, so that our footsteps resounded on the bare boards as though we were in an empty house. I stumbled up after my guide, feeling my way by the hand-rail, and on the first floor followed him into a room similar in size to the one below and very barely furnished, though less squalid than the other. A single candle at the farther end threw its feeble light on a figure in the bed, leaving the rest of the room in a dim twilight.

"Here is the doctor, Henry," Mr. Morgan called out as we entered, and, receiving no answer, he added: "He seems to be dozing as usual."

I stepped forward to look at my patient while Mr. Morgan remained at the other end of the room, pacing noiselessly backward and forward in the semi-obscureness. By the light of the candle I saw an elderly man with good features and an intelligent and even attractive face, but dreadfully emaciated, bloodless and yellow. He lay with half-closed eyes and seemed to be in a dreamy, somnolent state, although not actually asleep. I advanced to the bedside and addressed him somewhat loudly by name, but the only response was a slight lifting of the eyelids which, after a brief, drowsy glance at me, slowly subsided to their former position.

I now proceeded to feel his pulse, grasping his wrist with intentional briskness in the hope of rousing him from his stupor. The beats were slow and feeble and slightly irregular, giving clear evidence, if any were wanted, of his generally lowered vitality. My attention was next directed to the patient's eyes, which I examined closely with the aid of the candle, raising the lids somewhat roughly so as to expose the whole of the iris. He submitted without resistance to my rather ungentle handling, and showed no signs of discomfort even when I brought the flame of the candle to within a couple of inches of his eyes.
His extreme tolerance of light, however, was in no way surprising when one came to examine the pupils, for they were contracted to such a degree as to present only the minutest point of black upon the gray iris.

But the excessive contraction of the pupils was not the only singular feature in the sick man’s eyes. As he lay on his back, the right iris sagged down slightly toward its center, showing a distinctly concave surface and, whenever any slight movement of the eyeball took place, a perceptible undulatory movement could be detected in it.

The patient had, in fact, what is known as a tremulous iris, a condition that is seen in cases where the crystalline lens has been extracted for the cure of cataract, or where it has become accidentally displaced, leaving the iris unsupported. Now, in the present case the complete condition of the iris made it clear that the ordinary extraction operation had not been performed, nor was I able, on the closest inspection with the aid of a lens, to find any signs of the less common "needle operation." The inference was that the patient had suffered from the accident known as dislocation of the lens, and this led to the further inference that he was almost or completely blind in the right eye.

This conclusion was, indeed, to some extent negatived by a deep indentation on the bridge of the nose, evidently produced by spectacles habitually worn, for if only one eye were useful, a monocle would answer the purpose. Yet this objection was of little weight, for many men, under the circumstances, would elect to wear spectacles rather than submit to the inconvenience and disfigurement of the single eyeglass.

As to the nature of the patient’s illness, only one opinion seemed possible; it was a clear case of opium or morphia poisoning. To this conclusion all his symptoms seemed to point plainly enough. His coated tongue, which he protruded slowly and tremulously in response to a command bawled in his ear; his yellow skin and ghastly expression; his contracted pupils and the stupor from which he could be barely roused by the roughest handling, and which yet did not amount to actual insensibility—these formed a distinct and coherent group of symptoms, not only pointing plainly to the nature of the drug, but also suggesting a very formidable dose.

The only question that remained was: How and by whom that dose had been administered. The closest scrutiny of his arms and legs failed to reveal a single mark such as would be made by a hypodermic needle, and there was, of course, nothing to show or suggest whether the drug had been taken voluntarily by the patient himself or administered by some one else.

And then there remained the possibility that I might, after all, be mistaken in my diagnosis—a reflection that, in view of the obviously serious condition of the patient, I found eminently disturbing. As I pocketed my stethoscope and took a last look at my patient I realized that my position was one of extraordinary difficulty and perplexity. On the one hand my suspicions inclined me to extreme reticence, while, on the other, it was evidently my duty to give any information that might prove serviceable to the patient.
III. — FOUL PLAY?

"WELL, Doctor, what do you think of my brother?" Mr. Morgan asked as I joined him at the darkened end of the room. His manner, in asking the question, struck me as anxious and eager, but of course there was nothing remarkable in this.

"I think rather badly of him, Mr. Morgan," I replied. "He is certainly in a very low state."

"But you are able to form an opinion as to the nature of the disease?" he asked, still in a tone of suppressed eagerness.

"I can not give a very definite opinion at present," I replied guardedly. "The symptoms are decidedly obscure and might equally well indicate several different affections. They might be due to congestion of the brain and, in the absence of any other explanation, I am inclined to adopt that view. The most probable alternative is some narcotic drug such as opium, if it were possible for him to obtain access to it without your knowledge— but I suppose it is not?"

"I should say decidedly not," he replied. "You see, my brother is not very often left alone, and he never leaves the room, so I don't see how he could obtain anything. My housekeeper is absolutely trustworthy."

"Is he often as drowsy as he seems now?"

"Oh, very often. In fact, that is his usual condition. He rouses now and again and is quite lucid and natural for perhaps half an hour, and then he dozes off again and remains asleep for hours on end. You don't think this can be a case of sleeping-sickness, I suppose?"

"I think not," I answered, making a mental note, nevertheless, to look up the symptoms of this rare and curious disease as soon as I reached home. "Besides, he has not been in Africa, has he?"

"I can't say where he has been," was the reply. "He has just come from New York, but where he was before going there I have no idea."

"Well," I said, "we will give him some medicine and attend to his general condition, and I think I had better see him again very shortly. Meanwhile you must watch him closely, and perhaps you may have something to report to me at my next visit."

I then gave him some general directions as to the care of the patient, to which he listened attentively, and I once more suggested that I ought to see the sick man again quite soon.

"Very well, Doctor," Mr. Morgan replied, "I will send for you again in a day or two if he does not get better; and now if you will allow me to pay your fee, I will go and order the carriage while you write the prescription."

He handed me the fee and, having indicated some writing materials on a table near the bed, wished me good-evening and left the room.

As soon as I was left alone, I drew from my bag the hypodermic syringe with its little magazine of drugs that I always carried with me on my rounds. Charging the syringe with a full dose of atropin, I approached the patient once more, and, slipping up the sleeve of his night-shirt, injected the dose under the skin of his forearm. The prick of the needle roused him for a moment and he gazed at me with dull curiosity, mumbling some indistinguishable words. Then he relapsed once more into silence and apathy while I made haste to put the syringe back into its receptacle. I had just finished writing the prescription (a mixture of permanganate of potash to destroy any morphia that might yet remain in the patient's stomach) and was watching the motionless figure on the bed, when the housekeeper looked in at the door.

"The carriage is ready, doctor," said she, whereupon I rose and followed her downstairs.

The vehicle was drawn up in the covered way, as I perceived by the glimmer of the housekeeper's candle, which also enabled me dimly to discern the coachman standing close by in the shadow. I entered the carriage, the door was banged to and locked, and I then heard the heavy bolts of the gates withdrawn and the loud creaking of hinges. Immediately after, the carriage passed out and started off at a brisk pace, which was never relaxed until we reached our destination.

My reflections during the return journey were the reverse of pleasant, for I could not rid myself of the conviction that I was being involved in some very suspicious proceedings. And yet it was possible that I might be entirely mistaken—that the case might in reality be one of some brain affection accompanied by compression such as slow hemorrhage, abscess, tumor or simple congestion. Again, the patient might be a confirmed opium-eater, unknown to his brother. The cunning of these unfortunates is proverbial, and it would be quite possible for him to feign profound stupor so long as he was watched and then, when left alone for a few minutes, to nip out of bed and help himself from some secret store of the drug.

Still I did not believe this to be the true explanation. In spite of all the various possibilities, my suspicions came back to Mr. Morgan and refused to be dispelled. All the circumstances of the case itself were suspicious; so was the strange and sinister resemblance between the coachman and his employer; and so, most of all, was the fact that Mr. Morgan had told me a deliberate lie.

For he had lied, beyond all doubt. His statement as to the almost continuous stupor was absolutely irreconcilable with his other statement as to his brother's willfulness and obstinacy; and even more irreconcilable with the deep and comparatively fresh marks of the spectacles on the patient's nose. The man had certainly worn spectacles within twenty-four hours, which he would hardly have done if he had been in a state bordering on coma.
My reflections were, for the moment, interrupted by the stopping of the carriage. The door was unlocked and thrown open and I emerged from my dark and stuffy prison.

"You seem to have a good fresh horse," I remarked, as a pretext for having another look at the coachman.

"Ay," he answered, "he can go, he can. Good-night, sir."

He slammed the carriage door, mounted the box and drove off as if to avoid further conversation; and as I again compared his voice with those of his master, and his features with those I had seen so imperfectly in the darkened rooms, I was still inclined to entertain my suspicion that the coachman and Mr. Morgan were one and the same person.

Over my frugal supper I found myself taking up anew the thread of my meditations, and afterward, as I smoked my last pipe by the expiring surgery fire, the strange and sinister features of the case continued to obtrude themselves on my notice. Especially was I puzzled as to what course of action I ought to follow. Should I maintain the professional secrecy to which I was tacitly committed, or ought I to convey a hint to the police?

Suddenly, and with a singular feeling of relief, I bethought me of my old friend and fellow student, John Thorndyke, now an eminent authority on medical jurisprudence. Thorndyke was a barrister in extensive special practise and so would be able to tell me at once what was my duty from a legal point of view, and, as he was also a doctor of medicine, he would understand the exigencies of medical practise. If I could only find time to call at the Temple and put the case before him, all my doubts and difficulties would be resolved.

Anxiously I opened my visiting-list to see what kind of day's work was in store for me on the morrow. It was not a heavy day, but I was doubtful whether it would allow of my going so far from my district, until my eye caught, near the foot of the page, the name of Burton. Now Mr. Burton lived in one of the old houses on the east side of Bouverie Street—less than five minutes' walk from Thorndyke's chambers in King's Bench Walk, and he was, moreover, a "chronic" who could safely be left for the last. When I had done with Mr. Burton, I could look in on my friend with a good chance of catching him on his return from the hospital.

Having thus arranged my program, I rose, in greatly improved spirits, and knocked out my pipe just as the little clock banged out the hour of midnight.
IV. — I CONSULT THORNDYKE

"AND so," said Thorndyke, eyeing me critically as we dropped into our respective easy chairs by the fire with the little tea-table between us, "you are back once more on the old trail?"

"Yes," I answered, with a laugh, "the old trail, the long trail, the trail that is always new."

"And leads nowhere," added Thorndyke grimly.

I laughed again—not very heartily, for there was an uncomfortable element of truth in my friend's remark, to which my own experience bore out all too complete testimony. The medical practitioner whose lack of means forces him to subsist by taking temporary charge of other men's practices is likely to find that the passing years bring him little but gray hairs and a wealth of disagreeable experience.

"You will have to drop it, Jervis, you will, indeed," Thorndyke resumed after a pause. "This casual employment is preposterous for a man of your class and professional attainments. Besides, are you not engaged to be married, and to a most charming girl?"

"Juliet has just been exhorting me in similar terms—except as to the last particular," I replied. "She threatens to buy a practise and put me in at a small salary and batten on the proceeds. Moreover, she seems to imply that my internal charge of pride, vanity and egotism is equal to about four hundred pounds to the square inch and is rapidly approaching bursting-point. I am not sure that she is not right, too."

"Her point of view is eminently reasonable, at any rate," said Thorndyke. "But as to buying a practise, before you commit yourself to any such thing I ask you to consider the suggestion that I have made more than once—that you join me here as my junior. We worked together with excellent results in the 'Red Thumbmark' case, as the newspapers called it, and we could do as well in many another. Of course, if you prefer general practise, well and good; only remember that I should be glad to have you as my junior, and that in that capacity and with your abilities you would have an opening for something like a career."

"My dear Thorndyke," I answered, not without emotion. "I am more rejoiced at your offer and more grateful than I can tell you, and I should like to go into the matter this very moment. But I must not, for I have only a very short time now before I must go back to my work, and I have not yet touched upon the main object of my visit."

"I supposed that you had come to see me," remarked Thorndyke.

"So I did. I came to consult you professionally. The fact is, I am in a dilemma, and I want you to tell me what you think I ought to do."

Thorndyke paused in the act of refilling my cup and glanced at me anxiously.

"It is nothing that affects me personally at all," I continued. "But perhaps I had better give you an account of the whole affair from the beginning."

Accordingly I proceeded to relate in detail the circumstances connected with my visit to the mysterious patient of the preceding evening, to all of which Thorndyke listened with close attention and evident interest.

"A very remarkable story, Jervis," he said, as I concluded my narrative. "In fact, quite a fine mystery of the good, old-fashioned Adelphi drama type. I particularly like the locked carriage. You have obviously formed certain hypotheses on the subject?"

"Yes; but I have come to you to hear yours."

"Well," said Thorndyke, "I expect yours and mine are pretty much alike, for there are two obvious alternative explanations of the affair."

"As for instance?"

"That Mr. Morgan's account of his brother's illness may be perfectly true and straightforward. The patient may be an opium-eater or morphomaniac hitherto unsuspected. The secrecy and reticence attributed to him are quite consistent with such a supposition. On the other hand, Mr. J. Morgan's story may be untrue—which is certainly more probable—and he may be administering morphia for his own ends."

"The objection to this view is that morphia is a very unusual and inconvenient poison, except in a single fatal dose, on account of the rapidity with which tolerance of the drug is established. Nevertheless we must not forget that slow morphia poisoning might prove eminently suitable in certain cases. The prolonged use of morphia in large doses enfeebles the will, confuses the judgment and debilitates the body, and so might be adopted by a poisoner whose aim was to get some instrument or document executed, such as a will or assignment, after which, death might, if necessary, be brought about by other means. Did it seem to you as if Mr. Morgan was sounding you as to your willingness to give a death-certificate?"

"He said nothing to that effect, but the matter was in my mind, which was one reason for my extreme reticence."

"Yes, you showed excellent judgment in circumstances of considerable difficulty," said Thorndyke, "and, if our friend is up to mischief, he has not made a happy selection in his doctor. Just consider what would have happened—assuming the
man to be bent on murder—if some blundering, cocksure idiot had rushed in, jumped to a diagnosis, called the case, let us say, an erratic form of Addison's disease, and predicted a fatal termination. Thenceforward the murderer's course would be clear; he could compass his victim's death at any moment, secure of getting a death-certificate. As it is, he will have to move cautiously for the present—always assuming that we are not doing him a deep injustice."

"Yes," I answered, "we may take it that nothing fatal will happen just at present, unless some more easy-going practitioner is called in. But the question that is agitating me is, What ought I to do? Should I, for instance, report the case to the police?"

"I should say certainly not," replied Thorndyke. "In the first place, you can give no address, nor even the slightest clue to the whereabouts of the house, and, in the second, you have nothing definite to report. You certainly could not swear an information and, if you made any statement, you might find, after all, that you had committed a gross and ridiculous breach of professional confidence. No, if you hear no more from Mr. J. Morgan, you must watch the reports of inquests carefully and attend if necessary. If Mr. Morgan sends for you again, you ought undoubtedly to fix the position of the house. That is your clear duty for many and obvious reasons, and especially in view of your finding it necessary to communicate with the coroner or the police."

"That is all very well," I exclaimed, "but will you kindly tell me, my dear Thorndyke, how a man, boxed up in a pitch-dark carriage, is going to locate any place to which he may be conveyed?"

"I don't think the task presents any difficulties," he replied. "You would be prepared to take a little trouble, I suppose?"

"Certainly," I rejoined. "I will do my utmost to carry out any plan you may suggest."

"Very well, then. Can you spare me a few minutes?"

"It must be only a few," I answered, "for I ought to be getting back to my work."

"I won't detain you more than five minutes," said Thorndyke. "I will just run up to the workshop and get Polton to prepare what you will want, and when I have shown you how to get it to work I will let you go."

He hurried away, leaving the door open, and returned in less than a couple of minutes.

"Come into the office," said he, and I followed him into the adjoining room—a rather small but light apartment of which the walls were lined with labeled deed-boxes. A massive safe stood in one corner and, in another, close to a window, was a great roll-top table surmounted by a nest of over a hundred labeled drawers. From one of the latter he drew a paper-covered pocket note-book and, sitting down at the table, began to rule the pages each into three columns, two quite narrow and one broad.

He was just finishing the last page when there came a very gentle tap at the door.

"Is that you, Polton? Come in," said my friend.

The dry, shrewd-looking, little elderly man entered and I was at once struck by the incongruity of his workman's apron and rolled-up sleeves with his refined and intellectual face.

"Will this do?" he asked, holding out a little thin board about seven inches by five, to one corner of which a pocket compass had been fixed with shellac.

"The very thing, Polton, thank you."

"What a wonderful old fellow that is, Jervis!" my friend observed, as his assistant retired with a friendly smile at me. "He took in the idea instantly and he seems to have produced the finished article by magic, as the conjurers bring forth bowls of goldfish at a moment's notice. And now as to the use of this appliance. Can you read a compass?"

"Oh, yes," I replied. "I used to sail a small yacht at one time."

"Good, then you will have no difficulty, though I expect the compass needle will jig about a good deal in the carriage. Here is a pocket reading-lamp, which you can hook on to the carriage lining. This note-book can be fixed to the board with an india-rubber band—so. You observe that the thoughtful Polton has stuck a piece of thread on the glass of the compass to serve as a lubber's line. Now this is how you will proceed: As soon as you are locked in the carriage, light your lamp—better have a book with you in case the light is seen—get out your watch and put the board on your knee. Then enter in one narrow column of your note-book the time; in the other, the direction shown by the compass and, in the broad column, any particulars, including the number of steps the horse makes in a minute, Thus:—""

He opened the note-book and made one or two sample entries in pencil as follows:

9:40—S.E. Start from home.
9:41—S.W. Granite blocks.

"And so on. You follow the process, Jervis?"

"Perfectly," I answered. "It is quite clear and simple, though, I must say, highly ingenious. But I must really go now."
"Good-by, then," said Thorndyke, slipping a well-sharpened pencil through the rubber band that fixed the note-book to the board. "Let me know how you get on, and come and see me again as soon as you can, in any case."

He handed me the board and the lamp, and when I had slipped them into my pocket we shook hands and I hurried away, a little uneasy at having left my charge so long.
A COUPLE of days passed without my receiving any fresh summons from Mr. Morgan, a circumstance that occasioned me some little disappointment, for I was now eager to put into practise Thorndyke's ingenious plan for discovering the whereabouts of the house of mystery. When the evening of the third day was well advanced and Mr. Morgan still made no sign, I began to think that I had seen the last of my mysterious patient and that the elaborate preparations for tracking him to his hiding-place had been made in vain.

It was therefore with a certain sense of relief and gratification that I received, at about ten minutes to nine, the office-boy's laconic announcement of "Mr. Morgan's carriage," followed by the inevitable "Wants you to go and see him at once."

The two remaining patients were of the male sex—an important time-factor in medical practice—and, as they were both cases of simple and common ailments, I was able to dispatch their business in about ten minutes.

Then, bidding the boy close up the surgery, I put on my overcoat, slipped the little board and the lamp into the pocket, tucked a newspaper under my arm and went out.

The coachman was standing by the horse's head and touched his hat as he came forward to open the door.

"I have fortified myself for the long drive, you see," I remarked, exhibiting the newspaper as I stepped into the carriage. "But you can't read in the dark," said he.

"No, but I have a lamp," I replied, producing it and striking a match.

"Oh, I see," said the coachman, adding, as I hooked the lamp on to the back cushion, "I suppose you found it rather a dull ride last time?" Then, without waiting for a reply, he slammed and locked the door and mounted the box.

I laid the board on my knee, looked at my watch and made the first entry.

9:05—S.W. Start from home. Horse 13 hands.

As on the previous occasion, the carriage was driven at a smart and regular pace, but as I watched the compass I became more and more astonished at the extraordinarily indirect manner in which it proceeded. For the compass needle, though it oscillated continually with the vibration, yet remained steady enough to show the main direction quite plainly, and I was able to see that our course zigzagged in a way that was difficult to account for.

Once we must have passed close to the river, for I heard a steamer's whistle—apparently a tug's—quite near at hand, and several times we passed over bridges or archways. All these meanderings I entered carefully in my note-book, and mightily busy the occupation kept me; for I had hardly time to scribble down one entry before the compass needle would swing round sharply, showing that we had, once more, turned a corner.

At length the carriage slowed down and turned into the covered way, whereupon, having briefly noted the fact and the direction, I smuggled the board and the note-book—now nearly half-filled with hastily scrawled memoranda—into my pocket; and when the door was unlocked and thrown open, I was deep in the contents of the evening paper.

I was received, as before, by the housekeeper, who, in response to my inquiry as to the patient's condition, informed me that he had seemed somewhat better. "As, indeed, he ought to," she added, "with all the care and watching he gets from the master. But you'll see that for yourself, sir, and, if you will wait here, I will go and tell Mr. Morgan you have come."

An interval of about five minutes elapsed before she returned to usher me up the dark staircase to the sick-room, and, on entering, I perceived Mr. Morgan, stooping over the figure on the bed. He rose, on seeing me, and came to meet me with his hand extended.

"I had to send for you again, you see, Doctor," he said. "The fact is, he is not quite so well this evening, which is extremely disappointing, for he had begun to improve so much that I hoped recovery had fairly set in. He has been much brighter and more wakeful the last two days, but this afternoon he sank into one of his dozes and has seemed to be getting more and more heavy ever since."

"He has taken his medicine?" I asked.

"Quite regularly," replied Mr. Morgan, indicating with a gesture the half-empty bottle on the table by the bedside.

"And as to food?"

"Naturally he takes very little; and, of course, when these attacks of drowsiness come on, he is without food for rather long periods."

I stepped over to the bed, leaving Mr. Morgan in the shadow, as before, and looked down at the patient. His aspect was, if anything, more ghastly and corpse-like than before; he lay quite motionless and relaxed, the only sign of life being the slight rise and fall of his chest and the soft gurgling snore at each shallow breath. At the first glance I should have said that he was dying, and indeed, with my previous knowledge of the case, I viewed him with no little anxiety, even now.

He opened his eyes, however, when I shouted in his ear, and even put out his tongue when asked in similar stentorian tones, but I could get no answer to any of my questions—not even the half-articulate mumble I had managed to elicit on
the previous occasion. His stupor was evidently more profound now than then and, whatever might be the cause of his symptoms, he was certainly in a condition of extreme danger. Of that I had no doubt.

"I am afraid you don't find him any better to-night," remarked Mr. Morgan as I joined him at the other end of the room.

"No," I answered. "His condition appears to me to be very critical. I should say it is very doubtful whether he will rouse at all."

"You don't mean that you think he is dying?" Mr. Morgan spoke in tones of very unmistakable anxiety—even of terror.

"I think he might die at any moment," I replied.

"Good God!" exclaimed Morgan. "You horrify me!"

He evidently spoke the truth, for his appearance and manner denoted the most extreme agitation.

"I really think," he continued, "—at least I hope that you take an unnecessarily serious view of his condition. He has been like this before, you know."

"Possibly," I answered. "But there comes a last time, and it may have come now."

"Have you been able to form any more definite opinion as to the nature of this dreadful complaint?" he asked.

I hesitated for a moment and he continued:

"As to your suggestion that his symptoms might be due to drugs, I think we may consider that disposed of. He has been watched, practically without cessation, since you came last and, moreover, I have myself turned out the room and examined the bed, and not a trace of any drug was to be found. Have you considered the question of sleeping-sickness?"

I looked at the man narrowly before answering, and distrusted him more than ever. Still, my concern was with the patient and his present needs; I was, after all, a doctor, not a detective, and the circumstances called for straightforward speech and action on my part.

"His symptoms are not those of sleeping-sickness," I replied. "They are brain symptoms and are, in my opinion, due to morphia poisoning."
"BUT, my dear sir," he exclaimed, "the thing is impossible! Haven't I just told you that he has been watched continuously?"

"I can judge only by the appearances I find," I answered. Then, seeing that he was about to offer fresh objections, I continued: "Don't let us waste precious time in discussion, or your brother may be dead before we have reached a conclusion. If you will get some strong coffee made, I will take the other necessary measures, and perhaps we may manage to pull him round."

The decision of my manner cowed him; besides which he was manifestly alarmed. Replying stiffly that I "must do as I thought best," he hurried from the room, leaving me to carry out my part of the cure. And as soon as he was gone I set to work without further loss of time.

Having injected a full dose of atropin, I took down from the mantelshelf the bottle containing the mixture that I had prescribed—a solution of potassium permanganate. The patient's lethargic condition made me fear that he might be unable to swallow, so that I could not take the risk of pouring the medicine into his mouth for fear of suffocating him. A stomach-tube would have solved the difficulty, but of course I had none with me.

I had, however, a mouth-speculum, which also acted as a gag, and, having propped the patient's mouth open with this, I hastily slipped off one of the rubber tubes from my stethoscope and inserted into one end of it a vulcanite ear-speculum to act as a funnel. Then, introducing the other end of the tube into the gullet, I cautiously poured a small quantity of the medicine into the extemporized funnel.

To my great relief, a movement of the throat showed that the swallowing reflex still existed, and, thus encouraged, I poured down the tube as much of the fluid as I thought it wise to administer at one time.

I had just withdrawn the tube and was looking round for some means of cleansing it when Mr. Morgan returned and, contrary to his usual practise, came close up to the bed. He glanced anxiously from the prostrate figure to the tube that I was holding and then announced that the coffee was being prepared. As he spoke, I was able, for the first time, to look him fairly in the face by the light of the candle.

Now it is a curious fact—though one that most persons must have observed—that there sometimes occurs a considerable interval between the reception of a visual impression and its transfer to the consciousness. A thing may be seen, as it were, unconsciously, and the impression consigned, apparently, to instant oblivion, and yet the picture may be subsequently revived by memory with such completeness that its details can be studied as though the object were still actually visible. Something of that kind must have happened to me now, for, preoccupied as I was by the condition of the patient, the professional habit of rapid and close observation caused me to direct a searching glance at the man before me. It was only a brief glance, for Mr. Morgan, perhaps embarrassed by my intent regard of him, almost immediately withdrew into the shadow, but it revealed two facts of which I took no conscious note at the time, but which came back to me later and gave me much food for speculation.

One fact thus observed was that Mr. Morgan's eyes were of a bluish-gray, like those of his brother, and were surmounted by light-coloured eyebrows, entirely incongruous with his black hair and beard.

But the second fact was much more curious. As he stood, with his head slightly turned, I was able to look through one glass of his spectacles at the wall beyond. On the wall was a framed print, and the edge of the frame, seen through the spectacle-glass, appeared unaltered and free from distortion, as though seen through plain window-glass; and yet the reflections of the candle-flame in the spectacles showed the flame inverted, clearly proving that the glasses were concave on one surface at least.

These two apparently irreconcilable appearances, when I subsequently recalled them, puzzled me completely, and it was not until some time afterward that the explanation of the mystery came to me.

For the moment, however, the sick man occupied my attention to the exclusion of all else. As the atropin took effect he became somewhat less lethargic, for when I spoke loudly in his ear and shook him gently by the arm he opened his eyes and looked dreamily into my face; but the instant he was left undisturbed, he relapsed into his former condition. Presently the housekeeper arrived with a jug of strong black coffee, which I proceeded to administer in spoonfuls, giving the patient a vigorous shake-up between whiles and talking loudly into his ear.

Under this treatment he revived considerably and began to mumble and mutter in reply to my questions, at which point Mr. Morgan suggested that he should continue the treatment while I wrote a prescription.

"It seems as if you were right, after all, Doctor," he conceded, as he took his place by the bedside, "but it is a complete mystery to me. I shall have to watch him more closely than ever, that is evident."

His relief at the improvement of his brother's condition was most manifest and, as the invalid continued to revive apace, I thought it now safe to take my departure.

"I am sorry to have kept you so long," he said, "but I think the patient will be all right now. If you will take charge of him for a moment, I will go and call the coachman; and perhaps, as it is getting late, you could make up the prescription yourself and send the medicine back with the carriage."
To this request I assented and, as he left the room, I renewed my assaults upon the unresisting invalid.

In about five minutes the housekeeper made her appearance to tell me that the carriage was waiting and that she would stay with the patient until the master returned.

"If you take my candle, you will be able to find your way down, sir," she said.

To this I agreed and took my departure, candle in hand, leaving her shaking the patient’s hand with pantomimic cordiality and squalling into his ear shrill exhortations to "wake up and pull himself together."

As soon as I was shut in the carriage, I lighted my lamp and drew forth the little board and note-book, but the notes that I jotted down on the return journey were must less complete than before, for the horse, excelling his previous performances, rattled along at a pace that rendered writing almost impossible, and indeed more than once he broke into a gallop.

The incidents of that evening made me resolve to seek the advice of Thorndyke on the morrow and place the note-book in his hands, if the thing could possibly be done, and with this comforting resolution I went to bed. But:

¶

The best-laid schemes of mice and men
Gang aft a-gley,

and my schemes, in this respect, went "a-gley" with a vengeance. In the course of the following morning a veritable avalanche of urgent messages descended on the surgery, piling up a visiting-list at which I stood aghast.

Later on, it appeared that a strike in the building trade had been followed immediately by a general failure of health on the part of the bricklayers who were members of the benefit clubs, accompanied by symptoms of the most alarming and unclassical character, ranging from "sciatica of the blade-bones," which consigned one horny-handed sufferer to an armchair by the kitchen fire, to "windy spavins," which reduced another to a like piteous plight. Moreover, the sufferings of these unfortunates were viewed with callous skepticism by their fellow members (not in the building trade) who called aloud for detailed reports from the medical officer.

And, as if this were not enough, a local milkman, having secretly indulged in an attack of scarlatina, proceeded to shed microbes into the milk-cans, with the result that a brisk epidemic swept over the neighborhood.

From these causes I was kept hard at work from early morning to late at night, with never an interval for repose or reflection. Not only was I unable to call upon Thorndyke, but the incessant round of visits, consultations and reports kept my mind so preoccupied that the affairs of my mysterious patient almost faded from my recollection. Now and again, indeed, I would give a passing thought to the silent figure in the dingy house, and, as the days passed and the carriage came no more, I would wonder whether I ought not to communicate my deepening suspicions to the police. But, as I have said, my time was spent in an unceasing rush of work and the matter was allowed to lapse.

---
VII.—JEFFREY BLACKMORE’S WILL

THE hurry and turmoil continued without abatement during the three weeks that remained before my employer was due to return. Long harassing days spent in tramping the dingy streets of Kennington, or scrambling up and down narrow stairways, alternated with nights made hideous by the intolerable jangle of the night-bell, until I was worn out with fatigue. Nor was the labor made more grateful by the incessant rebuffs that fall to the lot of the “substitute,” or by the reflection that for all this additional toil and anxiety I should reap not a farthing of profit.

As I trudged through the dreary thoroughfares of this superannuated suburb with its once rustic villas and its faded gardens, my thoughts would turn enviously to the chambers in King’s Bench Walk and I would once again register a vow that this should be my last term of servitude.

From all of which it will be readily understood that when one morning there appeared opposite our house a four-wheeled cab laden with trunks and portmanteaux I hurried out with uncommon cordiality to greet my returning principal. He was not likely to grumble at the length of the visiting-list, for he was, as he once told me, a glutton for work, and a full day-book makes a full ledger. And, in fact, when he ran his eye down the crowded pages of my list he chuckled aloud and expressed himself as more than eager to get to work at once.

In this I was so far from thwarting him that by two o’clock I had fairly closed my connection with the practise, and half-an-hour later found myself strolling across Waterloo Bridge with the sensations of a newly-liberated convict and a check for twenty-five guineas in my pocket. My objective was the Temple, for I was now eager to hear more of Thorndyke’s proposal, and wished, also, to consult him as to where in his neighborhood I might find lodgings in which I could put up for a few days.

The “oak” of my friend’s chambers stood open and when I plied the knocker the inner door was opened by Polton.

"Why, it’s Dr. Jervis," said he, peering up at me in his quick birdlike manner, "The Doctor is out just now, but I am sure he wouldn’t like to miss you. Will you come in and wait? He will be in very shortly."

I entered and found two strangers seated by the fire, one an elderly professional-looking man—a lawyer as I guessed; the other a man of about twenty-five, fresh-faced, sunburnt and decidedly prepossessing in appearance. As I entered, the latter rose and made a place for me by the fire, for the day was chilly, though it was late Spring.

"You are one of Thorndyke’s colleagues, I gather," said the elder man after we had exchanged a few remarks on the weather. "Since I have known him I have acquired a new interest in and respect for doctors. He is a most remarkable man, sir, a positive encyclopedia of out-of-the-way and unexpected knowledge."

"His acquirements certainly cover a very wide area," I agreed.

"Yes, and the way in which he brings his knowledge to bear on intricate cases is perfectly astonishing," my new acquaintance continued. "I seldom abandon an obscure case or let it go into court until I have taken his opinion. An ordinary counsel looks at things from the same point of view as I do myself and has the same kind of knowledge, if rather more of it, but Thorndyke views things from a radically different standpoint and brings a new and totally different kind of knowledge into the case. He is a lawyer and a scientific specialist in one, and the combination of the two types of culture in one mind, let me tell you emphatically, is an altogether different thing from the same two types in separate minds."

"I can well believe that," I said and was about to illustrate my opinion when a key was heard in the latch and the subject of our discourse entered the room.

"Why, Jervis," he exclaimed cheerily, "I thought you had given me the slip again. Where have you been?"

"Up to my eyes in work," I replied. "But I am free—my engagement is finished."

"Good!" said he. "And how are you, Mr. Marchmont?"

"Well, not so young as I was at your age," answered the solicitor with a smile. "I have brought a client of mine to see you," he continued—", "Mr. Stephen Blackmore."

Thorndyke shook hands with the younger man and hoped that he might be of service to him.

"Shall I take a walk and look in a little later?" I suggested.

"Oh, no," answered Thorndyke. "We can talk over our business in the office."

"For my part," said Mr. Blackmore, "I see no necessity for Dr. Jervis to go away. We have nothing to tell that is not public property."

"If Mr. Marchmont agrees to that," said Thorndyke, "I shall have the advantage of being able to consult with my colleague if necessary."

"I leave the matter in your hands, Doctor," said the solicitor. "Your friend is no doubt used to keeping his own counsel."

"He is used to keeping mine, as a matter of fact," replied Thorndyke. "He was with me in the Hornby case, you may remember, Marchmont, and a most trusty colleague I found him; so, with your permission, we will consider your case with the aid of a cup of tea." He pressed an electric bell three times, in response to which signal Polton presently appeared with
a teapot and, having set out the tea-service with great precision and gravity, retired silently to his lair on the floor above.

"Now," said Mr. Marchmont, "let me explain at the outset that ours is a forlorn hope. We have no expectations whatever."

"Blessed are they who expect nothing," murmured Thorndyke.

"Quite so—by the way, what delicious tea you brew in these chambers! Well, as to our little affair. Legally speaking, we have no case—not the ghost of one. Yet I have advised my client to take your opinion on the matter, on the chance that you may perceive some point that we have overlooked. The circumstances, briefly stated, are these: My client, who is an orphan, had two uncles, John Blackmore, and Jeffrey, his younger brother. Some two years ago—to be exact, on the twenty-third of July, 1898—Jeffrey executed a will by which he made my client his executor and sole legatee. He had a pension from the Foreign Office, on which he lived, and he possessed personal property to the extent of about two thousand pounds.

"Early last year he left the rooms in Jermyn Street, where he had lived for some years, stored his furniture and went to Nice, where he remained until November. In that month, it appears, he returned to England and at once took chambers in New Inn, which he furnished with some of the things from his old rooms. He never communicated with any of his friends, so that the fact of his being in residence at the Inn only became known to them when he died.

"This was all very strange and different from his customary conduct, as was also the fact that he seems to have had no one to cook for him or look after his rooms.

"About a fortnight ago he was found dead in his chambers—under slightly peculiar circumstances, and a more recent will was then discovered, dated the ninth of December, 1899. Now no change had taken place in the circumstances of the testator to account for the new will, nor was there any material change in the disposition of the property. The entire personalty, with the exception of fifty pounds, was bequeathed to my client, but the separate items were specified, and the testator's brother, John Blackmore, was named as the executor and residuary legatee."

"I see," said Thorndyke. "So that your client's interest in the will would appear to be practically unaffected by the change."

"There it is!" exclaimed the solicitor, slapping the table to add emphasis to his words. "Apparently his interest is unaffected; but actually the change in the form of the will affects him in the most vital manner."

"Indeed!"

"Yes. I have said that no change had taken place in the testator's circumstances at the time the new will was executed. But only two days before his death, his sister. Mrs. Edmund Wilson, died and, on her will being proved, it appears that she had bequeathed to him her entire personalty, estimated at nearly thirty thousand pounds."

Thorndyke gave a low whistle.

"You see the point," continued Mr. Marchmont. "By the original will this great sum would have accrued to my client, whereas by the second will it goes to the residuary legatee, Mr. John Blackmore; and this, it appears to us, could not have been in accordance with the wishes and intentions of Mr. Jeffrey, who evidently desired his nephew to inherit his property."

"The will is perfectly regular?" inquired Thorndyke.

"Perfectly. Not a flaw in it."

"There seem to be some curious features in the case," said Thorndyke. "Perhaps we had better have a narrative of the whole affair from the beginning."

He fetched from the office a small note-book and a blotting-pad which he laid on his knee as he reseated himself.

"Now let us have the facts in their order," said he.
"WELL," said Mr. Marchmont, "we will begin with the death of Mr. Jeffrey Blackmore. It seems that about eleven o'clock in the morning of the twenty-seventh of March, that is, about a fortnight ago, a builder's man was ascending a ladder to examine a gutter on one of the houses in New Inn when, on passing a window that was open at the top, he looked in and perceived a gentleman lying on the bed. The gentleman was fully dressed and had apparently lain down to rest, but, looking again, the workman was struck by the remarkable pallor of the face and by the entire absence of movement. On coming down, he reported the matter to the porter at the lodge.

"Now the porter had already that morning knocked at Mr. Blackmore's door to hand him the receipt for the rent and, receiving no answer, had concluded that the tenant was absent. When he received the workman's report, therefore, he went to the door of the chambers, which were on the second floor, and knocked loudly and repeatedly, but there was still no answer.

"Considering the circumstances highly suspicious, he sent for a constable, and when the latter arrived the workman was directed to enter the chambers by the window and open the door from the inside. This was done, and the porter and the constable, going into the bedroom, found Mr. Blackmore lying upon the bed, dressed in his ordinary clothes, and quite dead."

"How long had he been dead?" asked Thorndyke.

"Less than twenty-four hours, for the porter saw him on the previous day. He came to the Inn about half-past six in a four-wheeled cab."

"Was any one with him?"

"That the porter can not say. The glass window of the cab was drawn up and he saw Mr. Blackmore's face through it only by the light of the lamp outside the lodge as the cab passed through the archway. There was a dense fog at the time—you may remember that very foggy day about a fortnight ago?"

"I do," replied Thorndyke. "Was that the last time the porter saw Mr. Blackmore?"

"No. The deceased came to the lodge at eight o'clock and paid the rent."

"By a check?" asked Thorndyke.

"Yes, a crossed check. That was the last time the porter saw him."

"You said, I think, that the circumstances of his death were suspicious."

"No, I said 'peculiar,' not 'suspicious'; it was a clear case of suicide. The constable reported to his inspector, who came to the chambers at once and brought the divisional surgeon with him. On examining the body they found a hypodermic syringe grasped in the right hand, and at the post-mortem a puncture was found in the right thigh. The needle had evidently entered vertically and deeply instead of being merely passed through the skin, which was explained by the fact that it had been driven in through the clothing.

"The syringe contained a few drops of a concentrated solution of strophanthin, and there were found on the dressing-table two empty tubes labeled 'Hypodermic Tabloids; Strophanthin 1-500 grain,' and a tiny glass mortar and pestle containing crystals of strophanthin. It was concluded that the entire contents of both tubes, each of which was proved to have contained twenty tabloids, had been dissolved to charge the syringe. The post-mortem showed, naturally, that death was due to poisoning by strophanthin.

"It was also proved that the deceased had been in the habit of taking morphia, which was confirmed by the finding in the chamber of a large bottle half full of morphia pills, each containing half a grain."

"The verdict was suicide, of course?" said Thorndyke.

"Yes. The theory of the doctors was that the deceased had taken morphia habitually and that, in a fit of depression caused by reaction from the drug, he had taken his life by means of the more rapidly acting poison."

"A very reasonable explanation," agreed Thorndyke. "And now to return to the will. Had your Uncle Jeffrey any expectations from his sister, Mr. Blackmore?"

"I can't say with certainty," replied Blackmore. "I knew very little of my aunt's affairs, and I don't think my uncle knew much more, for he was under the impression that she had only a life interest in her late husband's property."

"Did she die suddenly?" asked Thorndyke.

"No," replied Blackmore. "She died of cancer."

Thorndyke made an entry on his note-book and, turning to the solicitor, said:

"The will, you say, is perfectly regular. Has the signature been examined by an expert?"

"As a matter of form," replied Mr. Marchmont, "I got the head cashier of the deceased's bank to step round and compare the signatures of the two wills. There were, in fact, certain trifling differences; but these are probably to be explained by the
drug habit, especially as a similar change was to be observed in the checks that have been paid in during the last few months. In any case the matter is of no moment, owing to the circumstances under which the will was executed."

"Which were?"

"That on the morning of the ninth of December Mr. Jeffrey Blackmore came into the lodge and asked the porter and his son, a house-painter, who happened to be in the lodge at the time, to witness his signature. 'This is my will,' said he, producing the document, 'and perhaps you had better glance through it, though that is not necessary.' The porter and his son accordingly read through the will and then witnessed the signature and so were able to swear to the document at the inquest."

"Ah, then that disposes of the will," said Thorndyke, "even of the question of undue influence. Now, as to your Uncle Jeffrey, Mr. Blackmore. What kind of man was he?"

"A quiet, studious, gentle-mannered man," answered Blackmore, "very nervous, about fifty-live years of age, and not very robust. He was of medium height—about five feet seven—fair, slightly gray, clean shaven, rather spare, had gray eyes, wore spectacles and stooped slightly as he walked."

"And is now deceased," added Mr. Marchmont dryly, as Thorndyke noted down these apparently irrelevant particulars.

"How came he to be a civil-service pensioner at fifty-five?" asked Thorndyke.

"He had a bad fall from a horse, which left him, for a time, a complete wreck. Moreover, his eyesight, which was never very good, became much worse. In fact, he practically lost the sight of one eye altogether—it was the right one, I think—and as this had been his good eye, he felt the loss very much."

"You mentioned that he was a studious man. Of what nature were the subjects that occupied him?"

"He was an Oriental scholar of some position, I believe. He had been attached to the legations at Bagdad and Tokyo and had given a good deal of attention to Oriental languages and literature. He was also much interested in Babylonian and Assyrian archeology and assisted, for a time, in the excavations at Birs Nimroud."

"I see," said Thorndyke; "a man of considerable attainments. And now as to your Uncle John?"

"I can't tell you much about him," answered Blackmore. "Until I saw him at the inquest I had not met him since I was a boy, but he is as great a contrast to Uncle Jeffrey in character as in appearance."

"The two brothers were very unlike in exterior, then?"

"Well, perhaps I am exaggerating the difference. They were of much the same height, though John was a shade taller, and their features were, I suppose, not unlike; and their coloring was similar, but, you see, John is a healthy man with good eyesight and a brisk, upright carriage and he wears a large beard and mustache. He is rather stout, too, as I noticed when I met him at the inquest. As to his character, I am afraid he has not been a great credit to his family. He started in life as a manufacturing chemist, but of late years he has been connected with what they call, I think, a bucket-shop, though he describes himself as a stock broker."

"I see—an outside broker. Was he on good terms with his brother?"

"Not very, I think. At any rate, they saw very little of each other."

"And what were his relations with your aunt?"

"Not friendly at all. I think Uncle John had done something shady —let Mr. Wilson in, in some way, over a bogus investment, but I don't know the details."

"Would you like a description of the lady, Thorndyke?" asked Mr. Marchmont with genial sarcasm.

"Not just now, thanks," answered Thorndyke with a quiet smile, "but I will note down her full name."

"Julia Elizabeth Wilson."

"Thank you. There is just one more point—what were your uncle's habits and manner of life at New Inn?"

"According to the porter's evidence at the inquest," said Mr. Blackmore, "he lived in a very secluded manner. He had no one to look after his rooms, but did everything for himself, and no one is known to have visited the chambers. He was seldom seen about the Inn and the porter thinks that he must have spent most of his time indoors or else he must have been away a good deal—he can not say which."

"By the way, what has happened to the chambers since your uncle's death?"

"I understand that the porter has been instructed by the executor to let them."

"Thank you, Mr. Blackmore. I think that is all I have to ask at present. If anything fresh occurs to me, I will communicate with you through Mr. Marchmont."

The two men rose and prepared to depart,

"I am afraid there is little to hope for," said the solicitor as he shook my friend's hand, "but I thought it worth while to give you a chance of working a miracle."
"You would like to set aside the second will, of course?" said Thorndyke.

"Naturally; and a more unlikely case I never met with."

"It is not promising, I must admit. However, I will digest the material and let you have my views after due reflection."

The lawyer and his client took their departure, and Thorndyke, with a thoughtful and abstracted air, separated the written sheets from his note-book, made two perforations in the margins by means of a punch, and inserted them into a small Stolzenburg file, on the outside of which he wrote, "Jeffrey Blackmore’s Will."

"There," said he, depositing the little folio in a drawer labeled "B,"—"there is the nucleus of the body of data on which our investigations must be based; and I am afraid it will not receive any great additions, though there are some very singular features in the case, as you doubtless observed."

"I observed that the will seemed as simple and secure as a will could be made," I answered, "and I should suppose the setting of it aside to be a wild impossibility."

"Perhaps you are right," rejoined Thorndyke, "but time will show. Meanwhile I understand that you are a gentleman at large now; what are your plans?"

"My immediate purpose is to find lodgings for a week or so, and I came to you for guidance as to their selection."

"You had better let me put you up for the night, at any rate. Your old bedroom is at your service and you can pursue your quest in the morning, if you wish to. Give me a note and I will send Polton with it to bring up your things in a cab."

"It is exceedingly good of you, Thorndyke, but I hardly like to—"

"Now don’t raise obstacles, my dear fellow," urged Thorndyke. "Say yes, and let us have a long chat to-night over old times."

I was glad enough to be persuaded to so pleasant an arrangement, so I wrote a few lines on one of my cards, which was forthwith dispatched by the faithful Polton.
WE have an hour and a half to dispose of before dinner," said Thorndyke, looking at his watch. "What say you, my dear Jervis—shall we wander over the breezy uplands of Fleet Street or shall we seek the leafy shades of New Inn? I incline to New Inn, if that sylvan retreat commends itself to you."

"Very well," said I, "let it be New Inn. I suppose you want to nose around the scene of the tragedy, though what you expect to find is a mystery to me."

"A man of science," replied Thorndyke, "expects nothing. He collects facts and keeps an open mind. As for me, I am a mere legal snapper-up of unconsidered trifles of evidence. When I have accumulated a few facts I arrange them and reason from them. It is a capital error to decide beforehand what data are to be sought for."

"But surely," said I, as we emerged from the doorway and turned up toward Mitre Court, "you can not see any possible grounds for disputing that will?"

"I don't," he answered, "or I should have said so; but I am engaged to look into the case and I shall do so, as I said just now with an open mind. Moreover, the circumstances of the case are so singular, so full of strange coincidences and impossibilities, that they call for the closest and most searching examination."

"I hadn't observed anything so very abnormal in the case," I said. "Of course, I can see that the second will was unnecessary—that a codicil would have answered all purposes; that, as things have turned out, it does not seem to carry out the wishes of the testator; but then, if he had lived, Jeffrey Blackmore would probably have made a new will."

"Which would not have suited Brother John. But have you considered the significance of the order in which the events occurred and the strange coincidences in the dates?"

"I am afraid I missed that point," I replied. "How do the dates run?"

"The second will," replied Thorndyke, "was made on the ninth of December 1899; Mrs. Wilson died of cancer on the twenty-fourth of March, 1900; Jeffrey Blackmore was seen alive on the twenty-sixth of March, thus establishing the fact that he survived Mrs. Wilson, and his body was found on the twenty-seventh of March. Does that group of dates suggest nothing to you?"

I reflected for awhile and then had to confess that it suggested nothing at all.

"Then make a note of it and consider it at your leisure," said Thorndyke; "or I will write out the dates for you later, for here we are at our destination."

It was a chilly day, and a cold wind blew through the archway leading into New Inn. Halting at the half-door of the lodge we perceived a stout, purple-faced man crouching over the fire, coughing violently. He held up his hand to intimate that he was fully occupied for the moment, so we waited for his paroxysm to subside.

"Dear, dear!" exclaimed Thorndyke sympathetically, "you ought not to be sitting in this drafty lodge with your delicate chest. You should make them fit a glass door with a pigeonhole."

"Bless you," said the porter, wiping his eyes, "I daren't make any complaints. There's plenty of younger men ready to take the job. But it's terrible work for me in the Winter, especially when the fogs are about."

"It must be," rejoined Thorndyke, and then, rather to my surprise, he proceeded to inquire with deep interest into the sufferer's symptoms and the history of the attack, receiving in reply a wealth of detail and discursive reminiscence delivered with the utmost gusto. To all of this I listened a little impatiently, for chronic bronchitis is not, medically speaking, an entertaining complaint, and consultations out of business hours are an abomination to doctors. Something of this perhaps appeared in my manner, for the man broke off suddenly with an apology:

"But I mustn't detain you gentlemen talking about my health. It can't interest you, though it's serious enough for me."

"I am sure it is," said Thorndyke, "and I hope we may be able to do something for you. I am a medical man and so is my friend. We came to ask if you had any chambers to let."

"Yes, we've got three sets empty."

"Not furnished, I suppose?"

"Yes, one set is furnished. It is the one," he added, lowering his voice, "that the gentleman committed suicide in—but you wouldn't mind that, being a doctor?"

"Oh, no," laughed Thorndyke, "the disease is not catching. What is the rent?"

"Twenty-three pounds, but the furniture would have to be taken at a valuation. There isn't much of it."

"May I see the rooms?"

"Certainly. Here's the key; I've only just had it back from the police. There's no need for me to come with gentlemen like you; it's such a drag up all those stairs. The gas hasn't been cut off because the tenancy has not expired. It's Number 31, second floor."
"We made our way across the Inn to the doorway of Number 31, the ground floor of which was occupied by solicitors' offices. The dusk was just closing in and a man was lighting a lamp on the first-floor landing as we came up the stairs.

"Who occupies the chambers on the third floor?" Thorndyke asked him as we turned on to the next flight.

"The third floor has been empty for about three months," was the reply.

"We are looking at the chambers on the second floor," said Thorndyke. "Are they pretty quiet?"

"Quiet!" exclaimed the man. "Lord bless you! the place is like a deaf and dumb cemetery. There's the solicitors on the ground floor and the architects on the first floor. They both clear out at about six, and then the 'ouse is as empty as a blown hegg. I don't wonder poor Mr. Blackmore made away with hisself; he must 'ave found it awful dull."

"So," said Thorndyke, as the man's footsteps echoed down the stairs, "when Jeffrey Blackmore came home that last evening the house was empty."

He inserted the key into the door, above which was painted in white letters the deceased man's name, and we entered, my companion striking a wax vesta and lighting the gas in the sitting-room.

"Spare and simple," remarked Thorndyke, looking round critically. "but well enough for a solitary bachelor. A cupboard of a kitchen—never used, apparently, and a small bedroom opening out of the sitting-room. Why, the bed hasn't been made since the catastrophe! There is the impression of the body! Rather gruesome for a new tenant, eh?"

He wandered round the sitting-room, looking at the various objects it contained as though he would question them as to what they had witnessed. The apartment was bare and rather comfortless and its appointments were all old and worn. A small glass-fronted bookcase held a number of solid-looking volumes—proceedings of the Asiatic Society and works on Oriental literature for the most part; and a half-dozen framed photographs of buildings and objects of archeological interest formed the only attempts at wall decoration.

Before one of these latter Thorndyke halted and, having regarded it for a few moments with close attention, uttered an exclamation.

"Here is a very strange thing. Jervis," said he.

I stepped across the room and looked over his shoulder at an oblong frame enclosing a photograph of an inscription in the weird and cabalistic arrow-head character.

"Yes," I agreed; "the cuneiform writing is surely the most uncanny-looking script that was ever invented. I wonder if poor Blackmore was able to read this stuff; I suppose he was, or it wouldn't be here."

"I should say there is no doubt that he was able to read the cuneiform character; and that is just what constitutes the strangeness of this," and Thorndyke pointed, as he spoke, to the framed photograph on the wall.

"I don't follow you at all," I said. "It would seem to me much more odd if a man were to hang upon his wall an inscription that he could not read."

"No doubt," replied Thorndyke. "But you will agree with me that it would be still more odd if a man should hang upon his wall an inscription that he could read—and hang it upside-down!"

"You don't mean to say that this is up-side-down!" I exclaimed.

"I do indeed," he replied.

"But how can you tell that? I didn't know that Oriental scholarship was included in your long list of accomplishments."

Thorndyke chuckled. "It isn't," he replied; "but I have read with very keen interest the wonderful history of the decipherment of the cuneiform characters, and I happen to remember one or two of the main facts. This particular inscription is in the Persian cuneiform, a much more simple form of the script than the Babylonian or Assyrian; in fact, I suspect that this is the famous inscription from the gateway at Persepolis—the first to be deciphered, which would account for its presence here in a frame.

"Now this script reads, like our own writing, from left to right, and the rule is that all the wedge-shaped characters point to the right or downward, while the arrow-head forms are open toward the right. But if you examine this inscription you will see that the wedges point upward and to the left, and that the arrow-head characters are open toward the left. Obviously the photograph is upside-down."

"But this is really mysterious!" I exclaimed. "What do you suppose can be the explanation? Do you think poor Blackmore's eyesight was failing him, or were his mental faculties decaying?"

"I think," replied Thorndyke, "we may perhaps get a suggestion from the back of the frame. Let us see." He disengaged the frame from the two nails on which it hung and, turning it round, glanced for a moment at the back, which he then presented toward me with a quaint, half-quizzical smile. A label on the backing paper bore the words: "J. Budge, Frame-maker and Gilder, Gt. Anme St., W.C."

"Well?" I said, when I had read the label without gathering from it anything fresh.

"The label, you observe, is the right way up."
"So it is," I rejoined hastily, a little annoyed that I had not been quicker to observe so obvious a fact. "I see your point. You mean that the frame-maker hung the thing upside-down and Blackmore never noticed the mistake."

"No, I don't think that is the explanation," replied Thorndyke. "You will notice that the label is an old one; it must have been on some years, to judge by its dingy appearance, whereas the two mirror-plates look to me comparatively new. But we can soon put that matter to the test, for the label was evidently stuck on when the frame was new, and if the plates were screwed on at the same time, the wood which they cover will be clean and new-looking."

He drew from his pocket a "combination" knife containing, among other implements, a screw-driver, with which he carefully extracted the screws from one of the little brass plates by which the frame had been suspended from the nails.

"You see," he said, when he had removed the plate and carried the photograph over to the gas-jet, "the wood covered by the plate is as dirty and time-stained as the rest of the frame. The plates have been put on recently."

"And what are we to infer from that?"

"Well, since there are no other marks of plates or rings upon the frame, we may safely infer that the photograph was never hung up until it came to these rooms."

"Yes, I suppose we may. But what is the suggestion that this photograph makes to you? I know you have something in mind that bears upon the case you are investigating. What is it?"

"Come, come, Jervis," said Thorndyke, playfully, "I am not going to wet-nurse you in this fashion! You are a man of ingenuity and far from lacking in the scientific imagination; you must work out the rest of the train of deduction by yourself."

"That is how you always tantalize me!" I complained. "You take out the stopper from your bottle of wisdom and present the mouth to my nose; and then, when I have taken a hearty sniff and got my appetite fairly whetted, you clap in the stopper again and leave me, metaphorically speaking, with my tongue hanging out."

Thorndyke chuckled as he replaced the little brass plate and inserted the screws.

"You must learn to take out the stopper for yourself," said he; "then you will be able to slake your divine thirst to your satisfaction. Shall we take a look round the bedroom?"
X. — WE RENT 31 NEW INN

HE hung the photograph upon its nails and we passed on to the little chamber, glancing once more at the depression on the narrow bed, which seemed to make the tragedy so real.

"The syringe and the rest of the lethal appliances and material have been removed, I see," remarked Thorndyke. "I suppose the police or the coroner's officers have kept them."

He looked keenly about the bare, comfortless apartment, taking mental notes, apparently, of its general aspect and the few details it presented.

"Jeffrey Blackmore would seem to have been a man of few needs," he observed presently. "I have never seen a bedroom in which less attention seemed to be given to the comfort of the occupant."

He pulled at the drawer of the dressing-table, disclosing a solitary hair-brush; peeped into a cupboard, where an overcoat surmounted by a felt hat hung from a peg like an attenuated suicide; he even picked up and examined the cracked and shrunken cake of soap on the washstand, and he was just replacing this in its dish when his attention was apparently attracted by something in the dark corner close by. As he knelt on the floor to make a close scrutiny, I came over and stooped beside him. I found the object of his regard to be a number of tiny fragments of glass, which had the appearance of having been trodden upon and then scattered by a kick of the foot.

"What have you found?" I asked.

"That is what I am asking myself," he replied. "As far as I can judge from the appearance of these fragments, they appear to be the remains of a small watch-glass. But we can examine them more thoroughly at our leisure."

He gathered up the little splintered pieces with infinite care and bestowed them in the envelope of a letter which he drew from his pocket.

"And now," he said as he rose and dusted his knees, "we had better go back to the lodge, or the porter will begin to think that there has been another tragedy in New Inn."

We passed out into the sitting-room, where Thorndyke once more halted before the inverted photograph.

"Yes," he said, surveying it thoughtfully, "we have picked up a trifle of fact which may mean nothing, or, on the other hand, may be of critical importance."

He paused for a few moments and then said suddenly:

"Jervis, how should you like to be the new tenant of these rooms?"

"It is the one thing necessary for my complete happiness," I replied with a grin. "I am not joking," said he. "Seriously, these chambers might be very convenient for you, especially in some new circumstances that I, and I hope you also, have in contemplation. But in any case, I should like to examine the premises at my leisure, and I suppose you would not mind appearing as the tenant if I undertake all liabilities?"

"Certainly not," I answered. "Then let us go down and see what arrangements we can make." He turned out the gas and we made our way back to the lodge.

"What do you think of the rooms, sir?" asked the porter as I handed him back the key.

"I think they would suit me," I replied, "if the furniture could be had on reasonable terms."

"Oh, that will be all right," said the porter. "The executor—deceased's brother—has written to me saying that the things are to be got rid of for what they will fetch, but as quickly as possible. He wants those chambers off his hands, so, as I am his agent, I shall instruct the valuer to price them low."

"Can my friend have immediate possession?" asked Thorndyke. "You can have possession as soon as the valuer has seen the effects," said the porter. "The man from the broker's shop down Wych Street will look them over for us."

"I would suggest that we fetch him up at once," said Thorndyke. "Then you can pay over the price agreed on and move your things in without delay—that is, if our friend here has no objection."

"Oh, I have no objection," said the porter. "If you like to pay the purchase-money for the furniture and give me a letter agreeing to take on the tenancy, and a reference, you can have the key at once and sign the regular agreement later."

In a very short time this easy-going arrangement was carried out. The furniture broker was decoyed to the Inn and, having received his instructions from the porter, accompanied us to the vacant chambers.

"Now, gentlemen," said he, looking round disparagingly at the barely furnished rooms, "you tell me what things you are going to take and I will make my estimate."

"We are going to take everything—stock, lock and barrel," said Thorndyke.

"What! clothes and all?" exclaimed the man, grinning.
"Clothes, hats, boots—everything. We can throw out what we don't want afterward, but my friend wishes to have immediate possession of the rooms."

"I understand," said the broker, and without more ado he produced a couple of sheets of foolscap and fell to work on the inventory.

"This gentleman didn't waste much money on clothes," he remarked presently after examining the contents of a cupboard and a chest of drawers. "Why, there's only two suits all told!"

"He doesn't seem to have embarrassed himself with an excessive number of hats or boots either," said Thorndyke. "But I believe he spent most of his time indoors."

"That might account for it," rejoined the broker, and he proceeded to add to his list the meager account of clothing.

The inventory was soon completed and the prices affixed to the items, when it appeared that the value of the entire contents of the rooms amounted to no more than eighteen pounds, twelve shillings. This sum, at Thorndyke's request, I paid to the porter, handing him my recently-acquired check for twenty-five guineas and directing him to drop the change into the letter-box of the chambers.

"That is a good thing done," remarked Thorndyke, as we took our way back toward the Strand. "I will give you a check this evening and you might let me have the key for the present. I will send Polton down with a trunk this evening, to keep up appearances. And now we will go and have some dinner."

"To come back," said Thorndyke, when Polton had set before us our simple meal, with a bottle of sound claret, "to the new arrangement I proposed the other day: You know that Polton gives me a great deal of help in my work, especially by making appliances and photographs and carrying out chemical processes under my directions. But still, clever as he is and wonderfully well-informed, he is not a scientific man, properly speaking, and of course his education and social training do not allow of his taking my place excepting in a quite subordinate capacity. Now there are times when I am greatly pushed for the want of a colleague of my own class, and it occurred to me that you might like to join me as my junior or assistant. We know that we can rub along together in a friendly way, and I know enough of your abilities and accomplishments to feel sure that your help would be of value to me. What do you think of the proposal?"

To exchange the precarious, disagreeable and uninteresting life of a regular "locum" with its miserable pay and utter lack of future prospects, for the freedom and interest of the life thus held out to me with its chances of advancement and success, was to rise at a bound out of the abyss into which misfortune had plunged me, and to cut myself free from the millstone of poverty which had held me down so long. Moreover, with the salary that Thorndyke offered and the position that I should occupy as junior to a famous expert, I could marry without the need of becoming pecuniarily indebted to my wife; a circumstance which I was sure she would regard with as much satisfaction as I did. Hence I accepted joyfully, much to Thorndyke's gratification, and, the few details of our engagement being settled, we filled our glasses and drank to our joint success.
XI. — THE EMPTY HOUSE

"BY the way, Jervis," said my new principal—or colleague, as he preferred to style himself—when, our dinner over and our chairs drawn up to the fire, we were filling our pipes in preparation for a gossip, "you never told me the end of that odd adventure of yours."

"I went to the house once again," I answered, "and followed your directions to the letter, though how much skill and intelligence I displayed in following them you will be able to judge when you have seen the notebook; it is in my trunk upstairs with your lamp and compass."

"And what became of the patient?"

"Ah," I replied, "that is what I have often wondered. I don't like to think about it."

"Tell me what happened at the second visit," said Thorndyke.

I gave him a circumstantial description of all that I had seen and all that had happened on that occasion, recalling every detail that I could remember, even to the momentary glimpse I had of Mr. J. Morgan, as he stood in the light of the candle. To all of this my friend listened with rapt attention and asked me so many questions about my first visit that I practically gave him the whole story over again from the beginning.

"It was a fishy business," commented Thorndyke as I concluded, "but of course you could do nothing. You had not enough facts to swear an information on. But it would be interesting to plot the route and see where this extremely cautious gentleman resides. I suggest that we do so forthwith."

To this I assented with enthusiasm and, having fetched the notebook from my room, we soon had it spread before us on the table. Thorndyke ran his eye over the various entries, noting the details with an approving smile.

"You seem to be the manner born, Jervis," said he with a chuckle, as he came to the end of the first route. "That is quite an artistic touch—Passenger station to left.' How did you know there was a station?"

"I heard the guard's whistle and the starting of a train—evidently a long and heavy one, for the engine skidded badly."

"Good!" said Thorndyke. "Have you looked these notes over?"

"No," I answered. "I put the book away when I came in and have never looked at it since."

"It is a quaint document. You seem to be rich in railway bridges in those parts, and the route was certainly none of the most direct. However, we will plot it out and see whither it leads us."

He retired to the laboratory and presently returned with a T-square, a military protractor, a pair of dividers and a large drawing-board, upon which was pinned a sheet of paper.

"I see," said he, "that the horse kept up a remarkably even pace, so we can take the time as representing distance. Let us say that one inch equals one minute—that will give us a fair scale. Now you read out the notes and I will plot the route."

I read out the entries from the notebook—a specimen page of which I present for the reader's inspection—and Thorndyke laid off the lines of direction with the protractor, taking out the distance with the dividers from a scale of equal parts on the back of the instrument.

As the work proceeded a smile of quiet amazement spread over his keen, attentive face, and at each new reference to a railway bridge he chuckled softly.

"What! again?" he laughed, as I recorded the passage of the eighth bridge. "Why, it's like a game of croquet! Ah, here we are at last! 9.38—Slow down; enter arched gateway to left; Stop; Wooden gates closed. Just look at your route, Jervis."

He held up the board with a quizzical smile, when I perceived with astonishment that the middle of the paper was occupied by a single line that zigzagged, crossed and recrossed in the most intricate manner, and terminated at no great distance from its commencement.

"Now," said Thorndyke, "let us get the map and see if we can give to each of these marvelous and erratic lines 'a local habitation and a name.' You started from Lower Kennington Lane, I think?" "Yes; from this point," indicating the spot with a pencil.

"Then," said Thorndyke, after a careful comparison of the map with the plotted route, "I think we may take it that your gateway was on the north side of Upper Kennington Lane, some three hundred yards from Vauxhall Station. The heavy train that you heard starting was no doubt one of the Southwestern expresses. You see that, rough as was the method of tracing the route, it is quite enough to enable us to identify all the places on the map. The tram-lines and railway bridges are invaluable."

He wrote by the side of the strange crooked lines the names of the streets that its different parts represented and, on comparing the amended sketch with the ordnance map, I saw that the correspondence was near enough to preclude all doubt.

"To-morrow morning," observed Thorndyke, "I shall have an hour or two to spare, and I propose that we take a stroll through Upper Kennington Lane and gaze upon this abode of mystery. This chart has fairly aroused the trailing instinct—although, of course, the affair is no business of mine."

The following morning, after an early breakfast, we pocketed the chart and the notebook and, issuing forth into the Strand, chartered a passing hansom to convey us to Vauxhall Station.

"There should be no difficulty in locating the house," remarked Thorndyke presently, as we bowled along the Albert Embankment. "It is evidently about three hundred yards from the station, and I see you have noted a patch of newly laid macadam about half way."

"That new macadam will be pretty well smoothed down by now," I objected.

"Not so very completely," answered Thorndyke. "It is only three weeks, and there has been no wet weather lately."

A few minutes later the cab drew up at the station and, having alighted and paid the driver, we made our way to the
bridge that spans the junction of Harleyford Road and Upper Kennington Lane.

"From here to the house," said Thorndyke, "is three hundred yards—say four hundred and twenty paces, and at about two hundred paces we ought to pass a patch of new road-metal. Now, are you ready? If we keep step we shall average our stride."

We started together at a good pace, stepping out with military regularity, and counting aloud as we went. As we told out the hundred and ninety-fourth pace I observed Thorndyke nod toward the roadway a little ahead and, looking at it attentively as we approached, it was easy to see, by the regularity of the surface and lighter color, that it had recently been remetaled.

Having counted out the four hundred and twenty paces, we halted, and Thorndyke turned to me with a smile of triumph.

"Not a bad estimate, Jervis," said he. "That will be your house if I am not much mistaken." He pointed to a narrow turning a dozen yards ahead, apparently the entrance to a yard and closed by a pair of massive wooden gates.

"Yes," I answered, "there is no doubt that this is the place. But, by Jove!" I added, as we drew nearer, "the nest is empty. Do you see?" I pointed to a small bill that was stuck on the gate announcing, "These premises, including stabling and workshops, to be let," and giving the name and address of an auctioneer in Upper Kennington Lane as the agent.

"Here is a new and startling development," said Thorndyke, "which leads one to wonder still more what has happened to your patient. Now the question is, should we make a few inquiries of the auctioneer or should we get the keys and have a look at the inside of the house? I think we will do both, and the latter first, if Messrs Ryman Brothers will trust us with the keys."

We made our way to the auctioneer's office, and were, without demur, given permission to inspect the premises.

"You will find the place in a very dirty and neglected condition," said the clerk, as he handed us a couple of keys with a wooden label attached. "The house has not been cleaned yet, but is just as it was left when we took out the furniture."

"Was Mr. Morgan sold up then?" inquired Thorndyke.

"Oh, no. But he had to leave rather unexpectedly, and he asked us to dispose of his effects for him."

"He had not been in the house very long, had he?"

"No. Less than six months, I should say."

"Do you know where he has moved to?"

"I don't. He said he should be travelling for a time and he paid us a half-year's rent in advance to be quit. The larger key is that of the wicket in the front gate."

Thorndyke took the keys and we returned together to the house which, with its closed window-shutters, had a very gloomy and desolate aspect. We let ourselves in at the wicket, when I perceived, half-way down the entry, the side door at which I had been admitted by the unknown woman.

"We will look at the bedroom first," said Thorndyke, as we stood in the dark and musty-smelling hall. "That is, if you can remember which room it was."

"It was on the first floor," said I, "and the door was just at the head of the stairs." We ascended the two flights and as we reached the landing I halted. "This was the door," I said, and was about to turn the handle when Thorndyke caught me by the arm. "One moment, Jervis," said he. "What do you make of this?" He pointed to four screw-holes, neatly filled with putty, near the bottom of the door, and two others on the jamb opposite them.

"Evidently," I answered, "there has been a bolt there, though it seems a queer place to fix one."

"Not at all," rejoined Thorndyke. "If you look up you will see that there was another at the top of the door and, as the lock is in the middle, they must have been highly effective. But there are one or two other things that strike one. First, you will notice that the bolts have been fixed on pretty recently, for the paint that they covered is of the same grimy tint as that on the rest of the door. Next, they have been taken off, which, seeing that they could hardly have been worth the trouble of removal, seems to suggest that the person who fixed them considered that their presence might appear remarkable, while the screw-holes would be less conspicuous.

"They are on the outside of the door—an unusual situation for bolts; and if you look closely you can see a slight indentation in the wood of the jamb, made by the sharp edges of the socket-plate, as though at some time a forcible attempt has been made to drag the door open when it was bolted."

"There was a second door, I remember," said I. "Let us see if that was guarded in a similar manner."

We strode through the empty room, awakening dismal echoes as we trod the bare boards, and flung open the other door. At top and bottom similar groups of screw-holes showed that this also had been made secure, the bolts in all cases being of a very substantial size.

"I am afraid these fastenings have a very sinister significance," said Thorndyke gravely, "for I suppose we can have no doubt as to their object or by whom they were fixed."

"No, I suppose not," I answered; "but if the man was really imprisoned, could he not have smashed the window and
called for help?"

"The window looks out on the yard, as you see. And I expect it was secured, too."

He drew the massive old-fashioned shutters out of their recess and closed them.

"Yes, here we are!" He pointed to four groups of screw-holes at the corners of the shutters and, lighting a match, narrowly examined the insides of the recesses into which the shutters folded.

"The nature of the fastening is quite evident," said he. "An iron bar passed right across at the top and bottom and was secured by a staple and padlock. You can see the mark the bar made in the recess when the shutters were folded. By heaven, Jervis," he exclaimed as he flung the shutters open again, "this was a diabolical affair, and I would give a good round sum to lay my hand on Mr. J. Morgan!"
"IT is a thousand pities we were unable to look round before they moved out the furniture," I remarked. "We might then have found some clue to the scoundrel's identity."

"Yes," replied Thorndyke, gazing round ruefully at the bare walls, "there isn't much information to be gathered here, I am afraid. I see they have swept up the litter under the grate; we may as well turn it over, though it is not likely that we shall find anything of much interest."

He raked out the little heap of rubbish with the crook of his stick and spread it out on the hearth. It certainly looked unpromising enough, being just such a rubbish-heap as may be swept up in any untidy room during a move. But Thorndyke went through it systematically, examining each item attentively, even to the local tradesmen's bills and empty paper bags, before laying them aside. One of the latter he folded up neatly and laid on the mantel-shelf before resuming his investigations.

"Here is something that may give us a hint," said he presently. He held up a battered pair of spectacles of which only one hooked side-bar remained, while both the glasses were badly cracked.

"Left eye a concave cylindrical lens," he continued, peering through the glasses at the window; "right eye plain glass—these must have belonged to your patient, Jervis. You said the tremulous iris was in the right eye, I think?"

"Yes," I replied, "these are his spectacles, no doubt."

"The frames, you notice, are peculiar," he continued. "The shape was invented by Stopford of Moorfields and is made, I believe, by only one optician—Cuxton and Parry of New Bond Street."

"What should you say that is?" I asked, picking up a small object from the rubbish. It was a tiny stick of bamboo furnished with a sheath formed of a shorter length of the same material, which fitted it closely, yet slid easily up and down the little cane.

"Ha!" exclaimed Thorndyke, taking the object eagerly from my hand. "This is really interesting. Have you never seen one of these before? It is a Japanese pocket brush or pencil, and very beautiful little instruments they are, with the most exquisitely delicate and flexible points. They are used principally for writing or drawing with Chinese or, as it is usually called, Indian ink. The bamboo, in this one, is cracked at the end and the hair has fallen out, but the sliding sheath, which protected the point, remains to show what it has been."

He laid the brush-stick on the mantel-shelf and once more turned to the rubbish-heap.

"Now here is a very suggestive thing," he said presently, holding out to me a small wide-mouthed bottle. "Observe the flies sticking to the inside, and the name on the label—'Fox, Russell Street, Covent Garden.' You were right, Jervis, in your surmise; Mr. Morgan and the coachman were one and the same person.

"I don't see how you arrive at that, all the same," I remarked.

"This," said Thorndyke, tapping the bottle with his finger, "contained—and still contains a small quantity of—a kind of cement. Mr. Fox is a dealer in the materials for making-up, theatrical or otherwise. Now your really artistic make-up does not put on an oakum wig nor does he tie on a false beard with strings as if it were a baby's feeder. If he dons a false mustache or beard, the thing is properly made and securely fixed on, and then the ends are finished with ends of loose hair, which are cemented to the skin and afterward trimmed with scissors. This is the kind of cement that is used for that purpose."

He laid the bottle beside his other treasure-trove and returned to his search. But, with the exception of a screw and a trouser-button, he met with no further reward for his industry. At length he rose and, kicking the discarded rubbish back under the grate, gathered up his gleanings and wrapped them in his handkerchief, having first tried the screw in one of the holes in the door, from which he had picked out the putty, and found that it fitted perfectly.

"A poor collection," was his comment, as he pocketed the small parcel of miscellaneous rubbish, "and yet not so poor as I had feared. Perhaps, if we question them closely enough, these unconsidered trifles may be made to tell us something worth hearing, after all. We may as well look through the house and yard before we go."

We did so, but met with nothing that even Thorndyke's inquisitive eye could view with interest and, having returned the keys to the agent, betook ourselves back to the Temple.
XIII. — A CHANGE IN SIGNATURE

ON our return to Thorndyke's chambers I was inducted forthwith into my new duties, for an inquest of some importance was pending and my friend had been commissioned to examine the body and make a full report upon certain suspected matters.

I entered on the work with a pleasure and revived enthusiasm that tended to drive my recent experiences from my mind. Now and again, indeed, I gave a passing thought to the house in Kennington Lane and its mysterious occupants, but even then it was only the recollection of a strange experience that was past and done with.

Thorndyke, too, I supposed to have dismissed the subject from his mind, in spite of the strong feeling that he had shown and his implied determination to unravel the mystery. But on this point I was mistaken, as was proved to me by an incident that occurred on the fourth day of my residence and which I found, at the time, not a little startling.

We were sitting at breakfast, each of us glancing over the morning's letters, when Thorndyke said rather suddenly:

"Have you a good memory for faces, Jervis?"

"Yes," I answered, "I think I have, rather. Why do you ask?"

"Because I have a photograph here of a man whom I think you may have met. Just look at it and tell me if you remember the face."

He drew a cabinet-size photograph from an envelope that had come by the morning's post and passed it to me.

"I have certainly seen this face somewhere," said I, taking the portrait over to the window to examine it more thoroughly, "but I can not at the moment remember where."

"Try," said Thorndyke. "If you have seen the face before, you should be able to recall the person."

I looked intently at the photograph, and the more I looked, the more familiar did the face appear. Suddenly the identity of the man flashed into my mind and I exclaimed in a tone of astonishment:

"By heaven, Thorndyke, it is the mysterious patient of Kennington Lane!"

"I believe you are right," was the quiet reply, "and I am glad you were able to recognize him. The identification may be of value."

I need not say that the production of this photograph filled me with amazement and that I was seething with curiosity as to how Thorndyke had obtained it; but, as he replaced it impassively in its envelope without volunteering any explanation, I judged it best to ask no questions.

Nevertheless, I pondered upon the matter with undiminished wonder and once again realized that my friend was a man whose powers, alike of observation and inference, were of no ordinary kind. I had myself seen all that he had seen and, indeed, much more. I had examined the little handful of rubbish that he had gathered up so carefully and I would have flung it back under the grate without a qualm. Not a single glimmer of light had I perceived in the cloud of mystery, nor even a hint of the direction in which to seek enlightenment.

And yet Thorndyke had, in some incomprehensible manner, contrived to piece together facts that I had not even observed, and that very completely; for it was evident that he had already, in these few days, narrowed the field of inquiry down to a very small area and must be in possession of the leading facts of the case.

As to the other case—that of Jeffrey Blackmore's will—I had had occasional proofs that he was still engaged upon it, though with what object I could not imagine, for the will seemed to me as incontestable as a will could be. My astonishment may therefore be imagined when, on the very evening of the day on which he had shown me the photograph of my patient, Thorndyke remarked coolly, as we rose from the dinner-table:

"I have nearly finished with the Blackmore case. In fact, I shall write to Marchmont this evening and advise him to enter a caveat at once."

"Why," I exclaimed, "you don't mean to say that you have found a flaw in the second will, after all!"

"A flaw!" repeated Thorndyke. "My dear Jervis, that will is a forgery from beginning to end! Of that I have no doubt whatever. I am only waiting for the final, conclusive verification to institute criminal proceedings."

"You amaze me!" I declared. "I had imagined that your investigations were—well—"

"A demonstration of activity to justify the fee, eh?" suggested Thorndyke, with a mischievous smile.

I laughed a little shamefacedly, for my astute friend had, as usual, shot his bolt very near the mark.

"I haven't shown you the signatures, have I?" he continued. "They are rather interesting and suggestive. I persuaded the bank people to let me photograph the last year's checks in a consecutive series, so as to exhibit the change which was admitted to have occurred in the character of the signature. We pinned the checks to a board in batches, each check overlapping the one below so as to show the signature only and to save space, and the dates were written on a slip of paper at the side. I photographed them full size, a batch at a time, with a tele-photo lens."
"Why a tele-photo?" I asked.

"To enable me to get a full-sized image without bringing the checks close up to the camera," he replied. "If I had used an ordinary lens, the checks could hardly have been much more than a foot from the camera and then the signatures on the margin of the plate would certainly have undergone some distortion from the effects of perspective—even if the lens itself were free from all optical defects. As it is, the photographs are quite reliable, and the enlargements that Polton has made—magnified three diameters—show the characters perfectly."

He brought out from a drawer a number of whole-plate photographs which he laid on the table end to end. Each one contained four of the enlarged signatures and, thus exhibited in series in the order of their dates, it was easy to compare their characters. Further to facilitate the comparison, the signatures of the two wills—also enlarged—had each a card to itself and could thus be laid by the side of any one of the series.

"You will remember," said Thorndyke, "Marchmont referred to a change in the character of Jeffrey Blackmore's signature?"

I nodded.

"It was a very slight change and, though noticed at the bank, it was not considered to be of any moment. Now if you will cast your eye over the series, you will be able to distinguish the differences. They are very small indeed; the later signatures are a little stiffer, a little more shaky, and the B and the K are both appreciably different from those in the earlier signatures. But there is another fact which emerges when the whole series is seen together, and it is so striking and significant a fact that I am astonished at its having occasioned no inquiry."

"Indeed!" said I, stooping to examine the photographs with increased interest. "What is that?"

"It is a very simple matter and very obvious, but yet, as I have said, very significant. It is this: the change in the characters of the signatures is not a gradual or insidious change, nor is it progressive. It occurs at a certain definite point and then continues without increase or variation. Look carefully at the check dated twentieth of September and you will see that the signature is in what we may call the 'old manner,' whereas the next check, dated the eighteenth of October, is in the new manner.

"Now if you will run your eye through the signatures previous to the twentieth of September, you will observe that none of them shows any sign of change whatever; they are all in the 'old manner'; while the signatures subsequent to the twentieth of September, from the eighteenth of October onwards, are, without exception, in the 'new manner.'

"The alteration, slight and trivial as it is, is to be seen in every one of them; and you will also notice that it does not increase as time goes on; it is not a progressive change; the signature on the last check—the one that was drawn on the twenty-sixth of March to pay the rent—does not differ from the 'old manner' any more than that dated the eighteenth of October. A rather striking and important fact."

"Yes; and the signatures of the two wills?"

"The first will is signed in the 'old manner,' as you can see for yourself, while the signature of the second will has the characters of what we have called the 'new manner.' It is identical in style with the signatures subsequent to the twentieth of September."

"Yes, I see that it is as you say," I agreed, when I had carefully made the comparison, "and it is certainly very curious and interesting. But what I do not see is the bearing of all this. The second will was signed in the presence of witnesses and that seems to dispose of the whole matter."

"It does," Thorndyke admitted; "but we must not let our data overlap. It is wise always to consider each separate fact on its own merits and work it out to a finish without allowing ourselves to be disturbed or our attention diverted by any seeming incompatibilities with other facts. Then, when we have each datum as complete as we can get it, we may put them all together and consider their relations to one another. It is surprising to see how the incompatibilities become eliminated if we work in this way—how the most (apparently) irreconcilable facts fall into agreement with one another."

"As an academic rule for conducting investigations," I replied, "your principle is, no doubt, entirely excellent. But when you seek to prove by indirect and collateral evidence that Jeffrey Blackmore did not sign a will which two respectable men have sworn they saw him sign, why, I am inclined to think that—"

"That, in the words of the late Captain Bunsby, 'the bearing of these observations lies in their application.'"

"Precisely," I agreed, and we both laughed.
"HOWEVER," I resumed presently, "as you are advising Marchmont to dispute the will, I presume you have some substantial grounds for action, though I can not conceive what they may be."

"You have all the facts that I had to start with and on which I formed the opinion that the will was probably a forgery. Of course I have more data now, for, as 'money makes money,' so knowledge begets knowledge, and I put my original capital out to interest. Shall we tabulate the facts that are in our joint possession and see what they suggest?"

"Yes, do," I replied, "for I am hopelessly in the dark."

Thorndyke produced a note-book from a drawer and, uncapping his fountain pen, wrote down the leading facts, reading each aloud as soon as it was written.

1. The second will was unnecessary, since a codicil would have answered the purpose.
2. The evident intention of the testator was to leave the bulk of his property to Stephen Blackmore.
3. The second will did not, under existing circumstances, give effect to this intention, while the first will did.
4. The signature of the second will differs slightly from that of the first and also from the testator's ordinary signature.

"And as to the very curious group of dates:—
5. Mrs. Wilson made her will at the end of 1897, without acquainting Jeffrey Blackmore, who seems to have been unaware of the existence of this will.
6. His own second will was dated the ninth of December, 1899.
8. Jeffrey Blackmore was last seen alive on the twenty-sixth of March, 1900, i.e., two days after Mrs. Wilson's death.
9. His body was discovered on the twenty-seventh of March, three days after Mrs. Wilson's death.
10. The change in the character of his signature occurred abruptly between the twenty-ninth of September and the eighteenth of October.

"You will find that collection of facts repays careful study, Jervis, especially when considered in relation to the last of our data, which is:

11. We found, in Blackmore's chambers, a framed inscription hung on the wall upside down."

He passed the book to me and I pored over it intently, focusing my attention upon the various items with all the power of my will. But, struggle as I would, no general conclusion could be made to emerge from the mass of apparently disconnected facts.

"Well," said Thorndyke presently, after watching with grave interest my unavailing efforts, "what do you make of it?"

"Nothing!" I exclaimed desperately, slapping the book down upon the table. "Of course I can see that there are some queer features in the case, but you say the will is a forgery. Now I can find nothing in these facts to give the slightest color to such a supposition. You will think me an unmitigated donkey, I have no doubt, but I can't help that." My failure, it will be observed, had put me somewhat out of humor, and, observing this, Thorndyke hastened to reply:

"Not in the least my dear fellow; you merely lack experience. Wait until you have seen the trained legal intelligence brought to bear on these facts—which you will do, I feel little doubt, very soon after Marchmont gets my letter. You will have a better opinion of yourself then. By the way, here is another little problem for you. What was the object of which these are parts?"

He pushed across the table a little cardboard box, having first removed the lid. In it were a number of very small pieces of broken glass, some of which had been cemented together by their edges.

"These, I suppose, are the pieces of glass that you picked up in poor Blackmore's bedroom," I said, looking at them with considerable curiosity.

"Yes," replied Thorndyke. "You see that Polton has been endeavoring to reconstitute the object, whatever it was; but he has not been very successful, for the fragments were too small and irregular and the collection too incomplete. However, here is a specimen, built up of six small pieces, which exhibits the general character of the object fairly well."

He picked out the little irregular-shaped object and handed it to me, and I could not but admire the neatness with which Polton had joined the little fragments together.

"It was not a lens," I pronounced, holding it up before my eyes and moving it to and fro as I looked through it.
"No, it was not a lens," Thorndyke agreed.

"And so can not have been a spectacle glass. But the surface was curved—one side convex and the other concave—and the little piece that remains of the original edge seems to have been ground to fit a bezel or frame. I should say that these are portions of a small watch-glass."

"That is Polton's opinion," said Thorndyke. "And I think you are both wrong."

"What do you think it is?" I asked.

"I am submitting the problem for solution by my learned brother," he replied with an exasperating smile.

"You had better be careful!" I exclaimed, clapping the lid on to the box and pushing it across to him. "If I am tried beyond endurance I may be tempted to set a booby-trap to catch a medical jurist. And where will your reputation be then?"

Thorndyke's smile broadened, and he broke into an appreciative chuckle.

"Your suggestion has certainly extensive possibilities in the way of farce," he admitted "and I tremble at your threat. But I must write my letter to Marchmont and we will go out and lay the mine in the Fleet Street post-box. I should like to be in his office when it explodes."

"I expect, for that matter," said I, "the explosion will soon be felt pretty distinctly in these chambers."

"I expect so, too," replied Thorndyke. "And that reminds me that I shall be out all day to-morrow, so, if Marchmont calls and seems at all urgent, you might invite him to look in after dinner and talk the case over."

I promised to do so and hoped sincerely that the solicitor would accept the invitation; for I, at any rate, was on tenterhooks of curiosity to hear my colleague's views on Jeffrey Blackmore's will.
XV. — A CALL FROM THE LAWYERS

MY friend’s expectations in respect to Mr. Marchmont were fully realized, for on the following morning, within an hour of his departure from the chambers, the knocker was plied with more than usual emphasis and, on my opening the door, I discovered the solicitor in company with a somewhat older gentleman. Mr. Marchmont appeared rather out of humor, while his companion was obviously in a state of extreme irritation.

"Howdy-do, Dr. Jervis?" said Marchmont, as he entered at my invitation. "Your colleague, I suppose, is not in just now?"

"No, and he will not be returning until the evening."

"Hm; I’m sorry. We wished to see him rather particularly. This is my partner, Mr. Winwood."

The latter gentleman bowed stiffly, and Marchmont continued:

"We have had a letter from Mr. Thorndyke, and it is, I may say, a rather curious letter—in fact, a very singular letter indeed."

"It is the letter of a madman!" burst in Mr. Winwood.

"No, no, Winwood, don’t say that; but it is really rather incomprehensible. It relates to the will of the late Jeffrey Blackmore—you know the main facts of the case—and we can not reconcile it with those facts."

"This is the letter," exclaimed Mr. Winwood, dragging the document from his wallet and slapping it down on the table. "If you are acquainted with the case, sir, just read that and let us hear what you think."

I took up the letter and read:

**DEAR MR. MARCHMONT,**

_Jeffrey Blackmore, decd.: I have gone into this case with some care and have now no doubt that the second will is a forgery. I therefore suggest that, pending the commencement of criminal proceedings, you lose no time in entering a caveat, and I will furnish you with particulars in due course."

_Yours truly,**

_John Thorndyke, Esq."

"Well!" exclaimed Mr. Winwood, glaring ferociously at me, "what do you think of the learned counsel’s opinion?"

"I knew that Thorndyke was writing to you to this effect," I replied "but I must frankly confess that I can make nothing of it. Have you acted on his advice?"

"Certainly not!" shouted the irascible lawyer. "Do you suppose we wish to make ourselves the laughing-stock of the courts? The thing is impossible—ridiculously impossible!"

"It can’t be that, you know," said I a little stiffly, for I was somewhat nettled by Mr. Winwood’s manner, "or Thorndyke would not have written this letter. You had better see him and let him give you the particulars, as he suggests. Could you look in this evening after dinner—say at eight o’clock?"

"It is very inconvenient," grumbled Mr. Winwood; "we should have to dine in town."

"Yes, but it will be the best plan," said Marchmont. "We can bring Mr. Stephen Blackmore with us and hear what Dr. Thorndyke has done. Of course, if what he says is correct, Mr. Stephen’s position is totally changed."

"Bah!" exclaimed Winwood, "he has found a mare's-nest, I tell you. However, I suppose we must come, and we will bring Mr. Stephen by all means. The oracle’s explanation should be worth hearing—to a man of leisure, at any rate."

With this the two lawyers took their departure, leaving me to meditate upon my colleague’s astonishing statement, which I did, considerably to the prejudice of other employment. That Thorndyke would be able to justify the opinion he had given I had no doubt whatever; yet there was no denying that the thing was, upon the face of it, as Mr. Winwood had said, "ridiculously impossible."

When Thorndyke returned I acquainted him with the visit of the two lawyers, and also with the sentiments they had expressed, whereat he smiled with quiet amusement.

"I thought that letter would bring Marchmont to our door before long," said he. "As to Winwood, I have never met him, so he promises to give us what the variety artists would call an ‘extra turn.’ And what do you think of the affair yourself?"

"I have given it up," I answered, "and feel as if I had taken an overdose of Cannabis Indica."

Thorndyke laughed. "Come and dine," said he, "and let us crack a bottle, that our hearts may not turn to water under the frown of the disdainful Winwood."

He rang the bell for Polton, and when that ingenious person made his appearance, said:
"I expect that a man named Walker will call presently, Polton. If he does, take him to your room and detain him till I send for him."

We now betook ourselves to a certain old-world tavern in Fleet Street at which it was our custom occasionally to dine and where on the present occasion certain little extra touches gave a more than unusually festive character to our repast. Thorndyke was in excellent spirits, under the influence of which—and a bottle—he discoursed brilliantly on the evidence of the persistence of ancient racial types in modern populations, until the clock of the Law Courts, chiming three-quarters, warned us to return home.
XVI. — SOME SINGULAR FACTS

WE had not been back in the chambers more than a few minutes when the little brass knocker announced the arrival of our visitors. Thorndyke himself admitted them and then closed the oak.

"We felt that we must come round and hear a few particulars from you," said Mr. Marchmont, whose manner was now somewhat flurried and uneasy. "We could not quite understand your letter."

"Quite so," said Thorndyke. "The conclusion was a rather unexpected one."

"I should say, rather," exclaimed Mr. Winwood with some heat, "that the conclusion was a palpably ridiculous one."

"That," replied Thorndyke suavely, "can perhaps be better determined after examining all the facts that led up to it."

"No doubt, sir," retorted Mr. Winwood, growing suddenly red and wrathful, "but I speak as a solicitor who was practising in the law when you were an infant in arms! You say that this will is a forgery. I would remind you, sir, that it was executed in broad daylight in the presence of two unimpeachable witnesses, who have not only sworn to their signatures but, one of whom—the house-painter—obligingly left four greasy finger-prints on the document, for subsequent identification, if necessary!"

"After the excellent custom of the Chinese," observed Thorndyke. "Have you verified those finger-prints?"

"No, sir, I have not," replied Mr. Winwood. "Have you?"

"No. The fact is they are of no interest to me, as I am not disputing the witnesses' signatures."

At this, Mr. Winwood fairly danced with irritation.

"Marchmont," he exclaimed fiercely, "this is a mere hoax! This gentleman has brought us here to make fools of us!"

"Pray, my dear Winwood," said Marchmont, "control your temper. No doubt he—"

"But, confound it!" roared Winwood, "you yourself have heard him say that the will is a forgery, but that he doesn't dispute the signatures, which," concluded Winwood, banging his fist down upon the table, "is—nonsense!"

"May I suggest," interposed Stephen Blackmore, "that we came here to listen to Dr. Thorndyke's explanation of his letter? Perhaps it would be better to postpone any comments until we have heard it."

"Undoubtedly, undoubtedly," said Marchmont. "Let me beg you, Winwood, to listen patiently and refrain from interruption until we have our learned friend's exposition of his opinion."

"Oh, very well," replied Winwood sulkily. "I'll say no more."

He sank into a chair with the manner of a man who shuts himself up and turns the key, and so remained throughout most of the subsequent proceedings, stony and impassive like a seated effigy at the portal of some Egyptian tomb. The other men also seated themselves, as did I, too, and Thorndyke, having laid on the table a small heap of documents, began without preamble.

"There are two ways in which I might lay the case before you," said he. "I might state my theory of the sequence of events and furnish the verification afterward, or I might retrace the actual course of my investigations and give you the facts in the order in which I obtained them myself, with the inferences from them. Which will you have first—the theory or the investigation?"

"Oh,—the theory!" growled Mr. Winwood, and shut himself up again with a snap.

"Perhaps it would be better," said Marchmont, "if we heard the whole argument from the beginning."

"I think," agreed Thorndyke, "that that method will enable you to grasp the evidence more easily. Now, when you and Mr. Stephen placed the outline of the case before me, there were certain curious features in it which attracted my attention, as they had, no doubt, attracted yours. In the first place, there was the strange circumstance that the second will should have been made at all, its provisions being, under the conditions then existing, practically identical with the first, so that the trifling alteration could have been met easily by a codicil. There was also the fact that the second will—making John Blackmore the residuary legatee—was obviously less in accordance with the intentions of the testator, so far as they may be judged, than the first one."

"The next thing that arrested my attention was the mode of death of Mrs. Wilson. She died of cancer. Now cancer is one of the few diseases of which the fatal termination can be predicted with certainty months before its occurrence, and its date fixed, in suitable cases, with considerable accuracy."

"And now observe the remarkable series of coincidences that are brought into light when we consider this peculiarity of the disease. Mrs. Wilson died on the twenty-fourth of March, 1900, having made her will two years previously. Mr. Jeffrey's second will was signed on the ninth of December, 1899—at a time, that is to say, when the existence of cancer must have been known to Mrs. Wilson's doctor, and might have been known to Mr. Jeffrey himself or any person interested. Yet it is practically certain that Mr. Jeffrey had no intention of bequeathing the bulk of his property to his brother John, as he did by executing this second will."
"Next, you will observe that the remarkable change in Mr. Jeffrey's habits coincides with the same events; for he came over from Nice, where he had been residing for a year—having stored his furniture meanwhile—and took up his residence at New Inn in September 1899, at a time when the nature of Mrs. Wilson's complaint must almost certainly have been known. At the same time, as I shall presently demonstrate to you, a distinct and quite sudden change took place in the character of his signature.

"I would next draw your attention to the singularly opportune date of his death, in reference to this will. Mrs. Wilson died upon the twenty-fourth of March. Mr. Jeffrey was found dead upon the twenty-seventh of March, and he was seen alive upon the twenty-sixth. If he had died only four days sooner, Mrs. Wilson's property would not have devolved upon him at all. If he had lived a few days longer, it is probable that he would have made a new will in his nephew's favor. Circumstances, therefore, conspired in the most singular manner in favor of Mr. John Blackmore.

"But there is yet another coincidence that you will probably have noticed.

"Mr. Jeffrey's body was found on the twenty-seventh of March, and then by the merest chance. It might have remained undiscovered for weeks—or even months; and if this had happened, it is certain that Mrs. Wilson's next of kin would have disputed John Blackmore's claim—most probably with success—on the grounds that Mr. Jeffrey died before Mrs. Wilson. But all this uncertainty and difficulty was prevented by the circumstance that Mr. Jeffrey paid his rent personally to the porter on the twenty-sixth, so establishing the fact beyond question that he was alive on that date.

"Thus, by a series of coincidences, John Blackmore is enabled to inherit the fortune of a man who, almost certainly, had no intention of bequeathing it to him."

Thorndyke paused, and Mr. Marchmont, who had listened with close attention, nodded as he glanced at his silent partner.

"You have stated the case with remarkable lucidity," he said, "and I am free to confess that some of the points you have raised had escaped my notice."

"Well, then," resumed Thorndyke, "to continue: The facts with which you furnished me, when thus collated, made it evident that the case was a very singular one, and it appeared to me that a case presenting such a series of coincidences in favor of one of the parties should be viewed with some suspicion and subjected to very close examination. But these facts yielded no further conclusion, and it was clear that no progress could be made until we had obtained some fresh data.

"In what direction, however, these new facts were to be looked for did not for the moment appear. Indeed, it seemed as if the inquiry had come to a full stop.

"But there is one rule which I follow religiously in all my investigations, and that is to collect facts of all kinds in any way related to the case in hand, no matter how trivial they may be or how apparently irrelevant."
"NOW, in pursuance of this rule, I took an opportunity, which offered, of looking over the chambers in New Inn, which had been left untouched since the death of their occupant, and I had hardly entered the rooms when I made a very curious discovery. On the wall hung a framed photograph of an ancient Persian inscription in cuneiform characters."

The expectant look which had appeared on Mr. Marchmont's face changed suddenly to one of disappointment, as he remarked:

"Curious, perhaps, but not of much importance to us, I am afraid."

"My uncle was greatly interested in cuneiform texts, as I think I mentioned," said Stephen Blackmore. "I seem to remember this photograph, too—it used to stand on the mantelpiece in his old rooms, I believe."

"Very probably," replied Thorndyke. "Well, it hung on the wall at New Inn, and it was hung upside-down."

"Upside-down!" exclaimed Blackmore. "That is really very odd."

"Very odd indeed," agreed Thorndyke. "The inscription, I find, was one of the first to be deciphered. From it Grotefend, with incredible patience and skill, managed to construct a number of the hitherto unknown signs. Now is it not an astonishing thing that an Oriental scholar, setting so much store by this monument of human ingenuity that he has a photograph of it framed, should then hang that photograph upon his wall upside-down?"

"I see your point," said Marchmont, "and I certainly agree with you that the circumstance is strongly suggestive of the decay of the mental faculties."

Thorndyke smiled almost imperceptibly as he continued:

"The way in which it came to be inverted is pretty obvious. The photograph had evidently been in the frame some years, but had never been hung up until lately, for the plates by which it was suspended were new; and when I unscrewed one, I found the wood underneath as dark and time-stained as elsewhere; and there were no other marks of plates or rings."

"The frame-maker had, however, pasted his label on the back of the frame, and as this label hung the right way up, it appeared as if the person who fixed on the plates had adopted it as a guide."

"Possibly," said Mr. Marchmont somewhat impatiently. "But these facts, though doubtless very curious and interesting, do not seem to have much bearing upon the genuineness of the late Mr. Blackmore's will."

"On the contrary," replied Thorndyke, "they appeared to me to be full of significance. However, I will return to the chambers presently, and I will now demonstrate to you that the alteration, which you have told me had been noticed at the bank, in the character of Mr. Jeffrey's signature, occurred at the time that I mentioned and was quite an abrupt change."

He drew from his little pile of documents the photographs of the checks and handed them to our visitors, by whom they were examined with varying degrees of interest.

"You will see," said he, "that the change took place between the twenty-ninth of September and the eighteenth of October and was, therefore, coincident in time with the other remarkable changes in the habits of the deceased."

"Yes, I see that," replied Mr. Marchmont, "and no doubt the fact would be of some importance if there were any question as to the genuineness of the testator's signature. But there is not. The signature of the will was witnessed, and the witnesses have been produced."

"Whence it follows," added Mr. Winwood, "that all this hairsplitting is entirely irrelevant and, in fact, so much waste of time."

"If you will note the facts that I am presenting to you," said Thorndyke, "and postpone your conclusions and comments until I have finished, you will have a better chance of grasping the case as a whole. I will now relate to you a very strange adventure which befell Dr. Jervis."

He then proceeded to recount the incidents connected with my visits to the mysterious patient in Kennington Lane, including the construction of the chart, presenting the latter for the inspection of his bearers. To this recital our three visitors listened in utter bewilderment, as, indeed, did I also; for I could not conceive in what way my adventures could be related to the affairs of the late Mr. Blackmore. This was manifestly the view taken by Mr. Marchmont, for during a pause, in which the chart was handed to him, he remarked somewhat stiffly:

"I am assuming, Dr. Thorndyke, that the curious story you are telling us has some relevance to the matter in which we are interested."

"You are quite correct in your assumption," replied Thorndyke. "The story is very relevant indeed, as you will presently be convinced."

"Thank you," said Marchmont, sinking back once more into his chair with a sigh of resignation.

"A few days ago," pursued Thorndyke, "Dr. Jervis and I located, with the aid of this chart, the house to which he had been called. We found that it was to let, the recent tenant having left hurriedly, so, when we had obtained the keys, we entered and explored in accordance with the rule that I mentioned just now."
Here he gave a brief account of our visit and the conditions that we observed, and was proceeding to furnish a list of the articles that he had found, when Mr. Winwood started from his chair.

"Good heavens, sir!" he exclaimed, "have I come here, at great personal inconvenience, to hear you read the inventory of a dust-heap?"

"You came by your own wish," replied Thorndyke, "and I may add that you are not being forcibly detained."

At this hint Mr. Winwood sat down and shut himself up once more.

"We will now," pursued Thorndyke with unmoved serenity, "consider the significance of these relics and we will begin with this pair of spectacles. They belonged to a person who was near-sighted and astigmatic in the left eye and almost certainly blind in the right. Such a description agrees entirely with Dr. Jervis's account of the sick man."

He paused for a moment, and then, as no one made any comment, proceeded:

"We next come to this little bamboo stick. It is part of a Japanese brush, such as is used for writing in Chinese ink or for making small drawings."

Again he paused as though expecting some remark from his listeners; but no one spoke, and he continued:

"Then there is this bottle with the theatrical wig-maker's label on it, which once contained cement. Its presence suggests some person who was accustomed to 'make up' with a false mustache or beard. You have heard Dr. Jervis's account of Mr. Morgan and his coachman, and will agree with me that the circumstances bear out this suggestion."

He paused once more and looked round expectantly at his audience, none of whom, however, volunteered any remark.

"Do none of these objects that I have described seem to have any suggestion for us?" he asked in a tone of some surprise.

"They convey nothing to me," said Mr. Marchmont, glancing at his partner, who shook his head like a restive horse.

"Nor to you, Mr. Blackmore?"

"No," replied Stephen, "unless you mean to suggest that the sick man was my Uncle Jeffrey."

"That is precisely what I do mean to suggest," rejoined Thorndyke. "I had formed that opinion, indeed, before I saw them and I need not say how much they strengthened it."

"My uncle was certainly blind in the right eye," said Blackmore.

"And," interrupted Thorndyke, "from the same cause— dislocation of the crystalline lens."

"Possibly. And he probably used such a brush as you found, since I know that he corresponded in Japanese with his native friends in Tokyo. But this is surely very slender evidence."

"It is no evidence at all," replied Thorndyke. "It is merely a suggestion."

"Moreover," said Marchmont, "there is the insuperable objection that Mr. Jeffrey was living at New Inn at this time."

"What evidence is there of that?" asked Thorndyke.

"Evidence!" exclaimed Marchmont impatiently. "Why, my dear sir—" he paused suddenly and, leaning forward, regarded Thorndyke with a new and rather startled expression,—you mean to suggest—" he began.

"I suggest to you what that inverted inscription suggested to me—that the person who occupied those chambers in New Inn was not Jeffrey Blackmore!"
THE lawyer appeared thunderstruck. "This is an amazing proposition!" he exclaimed. "Yet the thing is certainly not impossible, for now that you recall the fact, no one who had known him previously ever saw him at the Inn! The question of identity was never raised!"

"Excepting," said Mr. Winwood, "in regard to the body; which was certainly that of Jeffrey Blackmore."

"Yes, of course," said Marchmont; "I had forgotten that for the moment. The body was identified beyond doubt. You don't dispute the identity of the body, do you?"

"Certainly not," replied Thorndyke.

"Then for heaven's sake, tell us what you do mean, for I must confess that I am completely bewildered in this tangle of mysteries and contradictions!"

"It is certainly an intricate case," said Thorndyke, "but I think that you will find it comes together very completely. I have described to you my preliminary observations in the order in which I made them and have given you a hint of the nature of my inferences. Now I will lay before you the hypothesis that I have formed as to what were the actual occurrences in this mysterious case.

"It appeared to me probable that John Blackmore must have come to know, in some way, of the will that Mrs. Wilson had made in his brother's favor and that he kept himself informed as to the state of her health. When it became known to him that she was suffering from cancer, and that her death was likely to take place within a certain number of months, I think that he conceived the scheme that he subsequently carried out with such remarkable success.

"In September of 1899, Jeffrey Blackmore returned from Nice, and I think that John must have met him and either drugged him then and there and carried him to Kennington Lane, or induced him to go voluntarily. Once in the house and shut up in that dungeon-like bedroom, it would be easy to administer morphia—in small quantities at first and in larger doses afterward, as toleration of the drug became established."

"But could this be done against the victim's will?" asked Marchmont.

"Certainly. Small doses could be conveyed in food and drink, or administered during sleep, and then, you know, the morphia habit is quickly formed and, once it was established, the unfortunate man would probably take the drug voluntarily. Moreover this drug-habit weakens the will and paralyzes the mental faculties to an extraordinary degree—which was probably the principal object in using it.

"John Blackmore's intention, on this hypothesis, would be to keep his brother in a state of continual torpor and mental enfeeblement as long as Mrs. Wilson remained alive, so that the woman, his accomplice, could manage the prisoner, leaving him, John, free to play his part elsewhere.

"As soon he had thus secured his unfortunate brother, I suggest that this ingenious villain engaged the chambers at New Inn. In order to personate his brother, he must have shaved off his mustache and beard and worn spectacles; and these spectacles introduce a very curious and interesting feature into the case.

"To the majority of people the wearing of spectacles, for the purpose of disguise or personation, seems a perfectly simple and easy proceeding. But to a person of normal eyesight it is nothing of the kind; for if he wears spectacles suited for long sight, he is unable to see distinctly through them at all, while if he wears even weak concave or near-sight glasses, the effort to see through them soon produces such strain and fatigue that his eyes become disabled altogether. On the stage, of course, the difficulty is got over quite simply by using spectacles of plain window-glass, but in ordinary life this would hardly do; the 'property' spectacles would probably be noticed and give rise to suspicion.

"The personator would, therefore, be in this dilemma: if he wore actual spectacles he would not be able to see through them, while if he wore sham spectacles of plain glass his disguise might be detected. There is only one way out of the difficulty, and that not a very satisfactory one, but Mr. J. Morgan seems to have adopted it in lieu of a better.

"We have learned from Dr. Jervis that this gentleman wore spectacles and that these spectacles seemed to have had very peculiar optical properties; for while the image of the candle-flame reflected in them was inverted, showing that one surface at least was concave, my colleague observed that objects seen through them appeared quite free from distortion or change of size, as if seen through plain glass. But there is only one kind of glass which could possess these optical properties, and that is a plain glass with curved surfaces like an ordinary watch-glass."

I started when Thorndyke reached this point, and thought of the contents of the cardboard box, which I now saw was among the objects on the table.

"Do you follow the argument?" my colleague inquired.

"Yes," replied Mr. Marchmont, "I think I follow you, though I do not see the application of all this."

"That will appear presently. For the present we may take it that Mr. J. Morgan wore spectacles of this peculiar character, presumably for the purposes of disguise; and I am assuming, for the purposes of the argument, that Mr. J. Morgan and Mr. John Blackmore are one and the same."
"It is assuming a great deal," grunted Mr. Winwood.

"And now," continued Thorndyke, disregarding the last remark, "to return from this digression to John Blackmore's proceedings. I imagine that he spent very little time at the Inn—for the porter saw him only occasionally and believed him to be frequently absent—and when he was at Kennington Lane or at his office in the city, or elsewhere, he would replace his beard with a false one of the same appearance, which would require to be fixed on securely and finished round the edges with short hairs cemented to the skin—for an ordinary theatrical beard would be detected instantly in daylight.

"He would now commence experiments in forging his brother's handwriting, which he must have practised previously to have obtained Jeffrey's furniture from the repository where it was stored. The difference was observed at the bank, as Mr. Marchmont has told us, but the imitation was close enough not to arouse suspicion.

"The next thing was to make the fresh will and get it witnessed; and this was managed with such adroitness that, although neither of the witnesses had ever seen Jeffrey Blackmore, their identification has been accepted without question. It is evident that, when shaved, John Blackmore must have resembled his brother pretty closely or he would never have attempted to carry out this scheme, and he will have calculated, with much acuteness, that the porter, when called in to identify the body, would observe only the resemblance and would disregard any apparent difference in appearance.

"The position in which John Blackmore was now placed was one of extraordinary difficulty. His brother was immured in Kennington Lane, but, owing to the insecurity of his prison and the frequent absence of his jailer, this confinement could be maintained with safety only by keeping the imprisoned man continuously under the influence of full doses of morphia.

"This constant drugging must have been highly injurious to the health of a delicate man like Jeffrey and, as time went on, there must have loomed up the ever-increasing danger that he might die before the appointed time; in which event John would be involved in a double catastrophe, for, on the one hand, the will would now be useless, and, on the other, the crime would be almost inevitably discovered.

"It was, no doubt, with this danger in view that John called in Dr. Jervis—making, as it turned out, a very unsuitable choice. My colleague's assistance was invoked, no doubt, partly to keep the victim alive and partly in the hope that if that were impossible, he might be prepared to cover the crime with a death-certificate.

"We are now approaching the end of the tragedy. Mrs. Wilson died on the twenty-fourth of March. Circumstances point to the conclusion that the murder took place on the evening of the twenty-sixth. Now on that day, about half-past six in the evening, the supposed Jeffrey Blackmore entered New Inn in a four-wheeled cab, as you are aware, his face being seen at the window by the porter as the vehicle passed the lodge under the archway. There was a dense fog at the time, so the cab would be lost to sight as soon as it entered the Square. At this time the offices at No. 31 would be empty and not a soul present in the house to witness the arrival.

"From the first time that my suspicions took definite shape that cab seemed to me to hold the key to the mystery. There can be no doubt that it contained two people—one of them was John Blackmore, whose face was seen at the window, and the other, his victim, the unfortunate Jeffrey.

"As to what happened in that silent house there is no need to speculate. The peculiar vertical manner in which the needle of the syringe was introduced is naturally explained by the fact of its being thrust through the clothing, and we can not but admire the cool calculation with which the appliances of murder were left to give color to the idea of suicide.

"Having committed the crime, the murderer presently walked out and showed himself at the lodge, under the pretext of paying the rent, thus furnishing proof of survival in respect to Mrs. Wilson. After this he returned to the Inn, but not to the chambers, for there is a postern-gate, as you know, opening into Houghton Street. Through this, no doubt, the murderer left the Inn, and vanished, to reappear at the inquest unrecognizable in his beard, his padded clothing and eyes uncovered by spectacles.

"With regard to the identification of the body by the porter there is, as I have said, no mystery. There must have been a considerable resemblance between the two brothers, and the porter, taking it for granted that the body was that of his tenant, would naturally recognize it as such, for even if he had noticed any departure from the usual appearance, he would attribute the difference to changes produced by death.

"Such, gentlemen, is my theory of the circumstances that surrounded the death of Jeffrey Blackmore, and I shall be glad to hear any comments that you may have to make."
XIX. — STEP BY STEP

THERE was an interval of silence after Thorndyke had finished which was at last broken by Mr. Winwood.

"I must admit, sir," said he, "that you have displayed extraordinary ingenuity in the construction of the astonishing story you have told us, and that this story, if it were true, would dispose satisfactorily of every difficulty and obscure point in the case. But is it true? It seems to me to be a matter of pure conjecture, woven most ingeniously around a few slightly suggestive facts. And, seeing that it involves a charge of murder of a most diabolical character against Mr. John Blackmore, nothing but the most conclusive proof would justify us in entertaining it."

"It is not conjecture," said Thorndyke, "although it was so at first. But when I had formed a hypothesis which fitted the facts known to me, I proceeded to test it and have now no doubt that it is correct."

"Would you mind laying before us any new facts that you have discovered which tend to confirm your theory?" said Mr. Marchmont.

"I will place the entire mass of evidence before you," said Thorndyke, "and then I think you will have no more doubts than I have.

"You will observe that there are four points which require to be proved: The first is the identity of Jeffrey with the sick man of Kennington Lane; the second is the identity of Mr. J. Morgan with John Blackmore; the third is the identity of John Blackmore with the tenant of 31 New Inn, and the fourth is the presence together of John and Jeffrey Blackmore at the chambers on the night of the latter gentleman's death.

"We will take the first point. Here are the spectacles I found in the empty house. I tested them optically with great care and measured them minutely and wrote down on this piece of paper then-description. I will read it to you:"

"Spectacles for distance, curl sides, steel frames, Stopford's pattern, with gold plate under bridge. Distance between centers, 6.2 cm. Right eye plain glass. Left eye—3D spherical—2D cylindrical, axis 35°.

"I will write the description of this pattern are, I believe, made only by Cuxton & Parry of New Bond Street. I therefore wrote to Mr. Cuxton, who knows me, and asked if he had supplied spectacles to the late Jeffrey Blackmore, Esq., and, if so, whether he would send me a description of them, together with the name of the oculist who prescribed them.

"He replied, in this letter here, that he had supplied spectacles to the late Jeffrey Blackmore and described them thus:

"The spectacles were for distance and steel frames of Stopford's pattern, with curl sides and a gold plate under the bridge. The formula, which was from Mr. Hindley's prescription, was R.E. plain glass. L.E.—3D sph.—2D cyl., axis 35°.

"You see the descriptions are identical. I then wrote to Mr. Hindley, asking certain questions, to which he replied thus:

"You are quite right; Mr. Jeffrey Blackmore had a tremulous iris in his right eye (which was practically blind) due to dislocation of the lens. The pupils were rather large, certainly not contracted.

"You see the descriptions are identical. I then wrote to Mr. Hindley, asking certain questions, to which he replied thus:

"You are quite right; Mr. Jeffrey Blackmore had a tremulous iris in his right eye (which was practically blind) due to dislocation of the lens. The pupils were rather large, certainly not contracted.

"Thus, you see, the description of the deceased tallies with that of the sick man as given by Dr. Jervis, excepting that there was then no sign of his being addicted to taking morphia. One more item of evidence I have on this point, and it is one that will appeal to the legal mind.

"A few days ago, I wrote to Mr. Stephen, asking him whether he possessed a recent photograph of his Uncle Jeffrey. He had one and sent it to me by return. This portrait I showed to Dr. Jervis, asking him if he recognised the person. After examining it attentively, without any hint from me, he identified it as a portrait of the sick man of Kennington Lane."

"Indeed!" exclaimed Mr. Marchmont. "This is most important. Are you prepared to swear to the resemblance, Dr. Jervis?"

"Perfectly, I have not the slightest doubt," I replied.

"Excellent!" said Mr. Marchmont. "Pray go on, Dr. Thorndyke."

"Well, that is all the evidence I have on the first point," said Thorndyke, "but, to my mind, it constitutes practically conclusive proof of identity."

"It is undoubtedly very weighty evidence," Mr. Marchmont agreed.

"Now, as to the second point—the identity of John Blackmore with Mr. J. Morgan of Kennington Lane. To begin with the prima facie probabilities, in relation to certain assumed data. If we assume:

"1. That the sick man was Jeffrey Blackmore;

"2. That his symptoms were due to the administration of a slow poison;

"3. That the poison was being administered by J. Morgan, as suggested by his manifest disguise and the strange secrecy of his conduct;

"And if we then ask ourselves who could have a motive for causing the death of Mr. Jeffrey in this manner and at this time, the answer is John Blackmore, the principal beneficiary under the very unstable second will. The most obvious hypothesis, then, is that Mr. J. Morgan and John Blackmore were one and the same person."
"But this is mere surmise," objected Mr. Marchmont.

"Exactly; as every hypothesis must be until it has been tested and verified. And now for the facts that tend to support this hypothesis. The first item—a very small one—I picked up when I called on the doctor who had attended Mrs. Wilson. My object was to obtain particulars as to her illness and death, but, incidentally, I discovered that he was well acquainted with John Blackmore and had treated him—without operation and, therefore, without cure—for a nasal polypus. You will remember that Mr. J. Morgan appeared to have a nasal polypus. I may mention, by the way, that John Blackmore had been aware of Mrs. Wilson's state of health from the onset of her symptoms and kept himself informed as to her progress. Moreover, at his request a telegram was sent to his office in Cophall Avenue, announcing her death.

"The next item of evidence is more important. I made a second visit to the house-agent at Kennington for the purpose of obtaining, if possible, the names and addresses of the persons who had been mentioned as references when Mr. Morgan took the house. I ascertained that only one reference had been given—the intending tenant's stockbroker; and the name of that stockbroker was John Blackmore of Cophall Avenue."

"That is a significant fact," remarked Mr. Marchmont.

"Yes," answered Thorndyke, "and it would be interesting to confront John Blackmore with this house-agent, who would have seen him with his beard on. Well, that is all the evidence that I have on this point. It is far from conclusive by itself, but, such as it is, it tends to support the hypothesis that J. Morgan and John Blackmore were one and the same."

"I will now pass on to the evidence of the third point—the identity of John Blackmore with the tenant of New Inn."

"With reference to the inverted inscription, that furnishes indirect evidence only. It suggests that the tenant was not Jeffrey. But, if not Jeffrey, it was some one who was personating him; and that some one must have resembled him closely enough for the personation to remain undetected even on the production of Jeffrey's body. But the only person known to us who answers this description is John Blackmore."

"Again, the individual who personated Jeffrey must have had some strong motive for doing so. But the only person known to us who could have had any such motive is John Blackmore."

"The next item of evidence on this point is also merely suggestive and indirect, though to me it was of the greatest value, since it furnished the first link in the chain of evidence connecting Jeffrey Blackmore with the sick man of Kennington. On the floor of the bedroom in New Inn I found the shattered remains of a small glass object which had been trodden on. Here are some of the fragments in this box, and you will see that we have joined a few of them together to help us in our investigations."

"My assistant, who was formerly a watch-maker, judged them to be fragments of the thin crystal glass of a lady's watch, and that, I think, was also Dr. Jervis's opinion. But the small part which remains of the original edge furnishes proof in two respects that this was not a watch-glass. In the first place, on taking a careful tracing of this piece of the edge, I found that its curve was part of an ellipse; but watch-glasses, nowadays, are invariably circular. In the second place, watch-glasses are ground on the edge to a single bevel to snap into the bezel or frame; but the edge of this is ground to a double bevel, like the edge of a spectacle-glass which fits into a groove and is held in position by a screw."

"The unavoidable inference is that this was a spectacle-glass, but, since it had the optical properties of plain glass, it could not have been used to assist vision and was therefore presumably intended for the purpose of disguise. Now you will remember that Mr. J. Morgan wore spectacles having precisely the optical properties of a crystal watch-glass, and it was this fact that first suggested to me a possible connection between New Inn and Kennington Lane."

"By the way," said Stephen Blackmore, "you said that my uncle had plain glass in one side of his spectacles?"

"Yes," replied Thorndyke; "over his blind eye. But that was actually plain glass with flat surfaces, not curved like this one. I should like to observe, with reference to this spectacle-glass, that its importance as a clue is much greater than might, at first sight, appear. The spectacles worn by Mr. Morgan were not merely peculiar or remarkable; they were probably unique. It is exceedingly likely that there is not, in the whole world, another similar pair of spectacles. Hence, the finding of this broken glass does really establish a considerable probability that J. Morgan was, at some time, in the chambers in New Inn. But we have seen that it is highly probable that J. Morgan was, in fact, John Blackmore, wherefore the presence of this glass is evidence suggesting that John Blackmore is the man who personated Jeffrey at New Inn."

"You will have observed, no doubt, that the evidence on the second and third points is by no means conclusive when taken separately, but I think you will agree that the whole body of circumstantial evidence is very strong and might easily be strengthened by further investigation."

"Yes," said Marchmont, "I think we may admit that there is enough evidence to make your theory a possible and even a probable one; and if you can show that there are any good grounds for believing that John and Jeffrey Blackmore were together in the chambers on the evening of the twenty-sixth of March, I should say that you had made out a prima facie case. What say you, Winwood?"

"Let us hear the evidence," replied Mr. Winwood gruffly.

"Very well," said Thorndyke, "you shall. And, what is more, you shall have it first-hand."
XX. — THE ENEMY DECIDES

HE pressed the button of the electric bell three times and, after a short interval, Polton let himself in with his latch-key and beckoned to some one on the landing.

"Here is Walker, sir," said he, and he then retired, shutting the oak after him and leaving a seedy-looking stranger standing near the door and gazing at the assembled company with a mixture of embarrassment and defiance.

"Sit down, Walker," said Thorndyke, placing a chair for him. "I want you to answer a few questions for the information of these gentlemen."

"I know," said Walker with an oracular nod. "You can ask me anything you like."

"Your name, I believe, is James Walker?"

"That's me, sir." "And your occupation?"

"My occupation, sir, don't agree with my name at all, because I drives a cab—a four-wheeled cab is what I drives—and an uncommon dry job it is, let me tell you."

Acting on this delicate hint, Thorndyke mixed a stiff whisky and soda and passed it across to the cabman, who consumed half at a single gulp and then peered thoughtfully into the tumbler.

"Rum stuff, this soda-water," he remarked. "Makes it taste as if there wasn't no whisky in it."

This hint Thorndyke ventured to ignore and continued his inquiries:

"Do you remember a very foggy day about three weeks ago?"

"Rather. It was the twenty-sixth of March. I remember it because my benefit society came down on me for arrears that morning."

"Will you tell us now what happened to you between six and seven in the evening of that day?"

"I will," replied the cabman, emptying his tumbler by way of bracing himself up for the effort. "I drove a fare to Vauxhall Station and got there a little before six. As I didn't pick up no one there, I drove away and was just turning down Upper Kennington Lane when I see two gentlemen standing at the corner by Harleyford Road, and one of 'em hails me, so I pulls up by the curb. One of 'em seemed to be drunk, for the other one was holding him up, but he might have been feeling queer—it wasn't no affair of mine.

"But the rum thing about 'em was that they was as like as two peas. Their faces was alike, their clothes was alike, they wore the same kind of hats and they both had spectacles. 'Wot O!' says I to myself, 'ere's the Siamese Twins out on the jamboree!' Well, the gent what wasn't drunk he opens the door and shoves in the other one what was, and he says to me, he says: 'Do you know New Inn?' he says. Now there was a—silly question to ask a man what was born and brought up in White Horse Alley, Drury Lane. 'Do I know my grandmother?' says I.

"'Well,' says he, 'you drive in through the gate in Wych Street,' he says."

"'Of course I shall,' I says. 'Did you think I was going to drive in the back way down the steps?' I says.

"'And then,' he says, 'you drive down the Square nearly to the end and you'll see a house with a large brass plate at the corner of the doorway. That's where we want to be set down,' he says. With that he nips in and pulls up the windows and off we goes.

"It took us nigh upon half an hour to get to New Inn through the fog, and as I drove in under the archway I saw it was half-past six by the clock in the porter's lodge. I drove down nearly to the end of the square and drew up opposite a house where there was a large brass plate by the doorway. Then the gent what was sober jumps out and begins hauling out the other one. I was just getting down off the box to help him when he says, rather short-like:

"'All right, cabman,' he says, 'I can manage,' and he hands me five bob.

"The other gent seemed to have gone to sleep, and a rare job he had hauling him across the pavement. I see them, by the gas-lamps on the staircase, going up-stairs—regular Pilgrim's Progress it was, I tell you—but they got up at last, for I saw 'em light the gas in a room on the second floor. Then I drove off."

"Could you identify the house?" asked Thorndyke.

"I done it, this morning, You saw me. It was No. 31."

"How was it," said Marchmont, "that you did not come forward at the inquest?"

"What inquest?" inquired the cabman. "I don't know nothing about any inquest. The first I heard of the business was when one of our men told me yesterday about a notice what was stuck up in a shelter offering a reward for information concerning a four-wheel cab what drove to New Inn at six-thirty on the day of the fog at the end of last month. Then I came here and left a message, and this morning this gentleman came to me on the rank and paid up like a gentleman."

The latter ceremony was now repeated, and the cabman, having remarked that his services were at the disposal of the
present company to an unlimited extent on the same terms, departed, beaming with satisfaction.

When he had gone, our three visitors sat for awhile looking at one another in silence. At length Stephen Blackmore rose with a stern expression on his pale face and said to Thorndyke:

"The police must be informed of this at once. I shall never be able to rest until I know that justice has been dealt out to this cold-hearted, merciless villain!"

"The police have already been informed," said Thorndyke. "I completed the case this morning and at once communicated with Superintendent Miller of Scotland Yard. A warrant was obtained immediately and I had expected to hear that the arrest had been made long before this, for Mr. Miller is usually most punctilious in keeping me informed of the progress of cases which I introduce to him. We shall hear to-morrow, no doubt."

"And for the present the case seems to have passed out of our hands," observed Mr. Marchmont.

"I shall enter a caveat, all the same," said Mr. Winwood.

"Why, that doesn't seem very necessary," said Marchmont. "The evidence that we have heard is enough to secure a conviction, and there will be plenty more when the police go into the case. And a conviction would, of course, put an end to the second will."

"I shall enter a caveat, all the same," said Mr. Winwood.

As the two partners showed a disposition to become heated over this question, Thorndyke suggested that they might discuss it at leisure by the light of subsequent events.

Taking this as a hint, for it was now close upon midnight, our visitors prepared to depart and were, in fact, making their way towards the door, when the bell rang.

Thorndyke hastily dugg open the door and, as he recognized his visitor, uttered an exclamation of satisfaction.

"Ha! Mr. Miller, we were just speaking' of you. This is Mr. Stephen Blackmore, and these gentlemen are Messrs. Marchmont and Winwood, his solicitors, and my colleague, Dr. Jervis."

"Well, Doctor, I have just dropped in to give you the news, which will interest these gentlemen as well as yourself."

"Have you arrested the man?"

"No; he has arrested himself. He is dead!"

"Dead!" we all exclaimed together.

"Yes. It happened this way. We went down to his place at Surbiton early this morning, but it seemed he had just left for town, so we took the next train and went straight to his office. But they must have smoked us and sent him a wire, for, just as we were approaching the office, a man answering the description ran out, jumped into a hansom and drove off like the devil.

"We chanced its being the right man and followed at a run, hailing the first hansom that we met; but he had a good start and his cabby had a good horse, so that we had all our work cut out to keep him in sight. We followed him over Blackfriars Bridge and down Stamford Street to Waterloo; but as we drove up the slope to the station we met a cab coming down and, as the cabby kissed his hand and smiled at us, we concluded it was the one we had been following.

"I remembered that the Southampton Express was due to start about this time, so we made for the platform and, just as the guard was about to blow his whistle, we saw a man bolt through the barrier and run up the platform. We dashed through a few seconds later and just managed to get on the train as it was moving off. But he had seen us, for his head was out of the window when we jumped in, and we kept a sharp lookout on both sides in case he should hop out again before the train got up speed.

"However, he didn't, and nothing more happened until we stopped at Southampton. You may be sure we lost no time in getting out and we ran up the platform, expecting to see him make a rush for the barrier. But there was no sign of him anywhere, and we began to think that he had given us the slip.

"Then, while my inspector watched the barrier, I went down the train until I came to the compartment that I had seen him enter. And there he was, lying back in the off corner, apparently fast asleep. But he wasn't asleep. He was dead. I found this on the floor of the carriage."

He held up a tiny glass tube, labeled "Aconitin Nitrate gr. 1-640."

"Ha!" exclaimed Thorndyke. "This fellow was well up in poisons, it seems! This tube contained twenty tabloids, a thirty-second of a grain altogether, so if he swallowed them all he took about twelve times the medical dose. Well, perhaps he has done the best thing, after all."

"The best thing for you, gentlemen," said Mr. Miller, "for there is no need to raise any questions in detail at the inquest; and publicity would be very unpleasant for Mr. Blackmore. It is a thousand pities that you or Dr. Jervis hadn't put us on the scent in time to prevent the crime—though, of course, we couldn't have entered the premises without a warrant. But it is easy to be wise after the event. Well, good-night, gentlemen; I suppose this accident disposes of your business as far as the will is concerned?"

"I suppose it does," said Mr. Winwood; "but I shall enter a caveat, all the same."
THE MYSTERY OF 31 NEW INN

I. — THE MYSTERIOUS PATIENT

As I look back through the years of my association with John Thorndyke, I am able to recall a wealth of adventures and strange experiences such as falls to the lot of very few men who pass their lives within hearing of Big Ben. Many of these experiences I have already placed on record; but it now occurs to me that I have hitherto left unrecorded one that is, perhaps, the most astonishing and incredible of the whole series; an adventure, too, that has for me the added interest that it inaugurated my permanent association with my learned and talented friend, and marked the close of a rather unhappy and unprosperous period of my life.

Memory, retracing the journey through the passing years to the starting-point of those strange events, lands me in a shabby little ground-floor room in a house near the Walworth end of Lower Kennington Lane. A couple of framed diplomas on the wall, a card of Snellen’s test-types and a stethoscope lying on the writing-table, proclaim it a doctor’s consulting-room; and my own position in the round-backed chair at the said table, proclaims me the practitioner in charge.

It was nearly nine o’clock. The noisy little clock on the mantelpiece announced the fact, and, by its frantic ticking,
seemed as anxious as I to get the consultation hours over. I glanced wistfully at my mud-splashed boots and wondered if I might yet venture to assume the slippers that peeped coyly from under the shabby sofa. I even allowed my thoughts to wander to the pipe that reposed in my coat pocket. Another minute and I could turn down the surgery gas and shut the outer door. The fussy little clock gave a sort of preliminary cough or hiccup, as if it should say: “Ahem! ladies and gentlemen, I am about to strike.” And at that moment, the bottle-boy opened the door and, thrusting in his head, uttered the one word: “Gentleman.”

Extreme economy of words is apt to result in ambiguity. But I understood. In Kennington Lane, the race of mere men and women appeared to be extinct. They were all gentlemen—unless they were ladies or children—even as the Liberian army was said to consist entirely of generals. Sweeps, labourers, milkmen, costermongers—all were impartially invested by the democratic bottle-boy with the rank and title of armigeri. The present nobleman appeared to favour the aristocratic recreation of driving a cab or job-master’s carriage, and, as he entered the room, he touched his hat, closed the door somewhat carefully, and then, without remark, handed me a note which bore the superscription “Dr. Stillbury.”

“You understand,” I said, as I prepared to open the envelope, “that I am not Dr. Stillbury. He is away at present and I am looking after his patients.”

“It doesn’t signify,” the man replied. “You’ll do as well.”

On this, I opened the envelope and read the note, which was quite brief, and, at first sight, in no way remarkable.

“DEAR SIR,” it ran, “Would you kindly come and see a friend of mine who is staying with me? The bearer of this will give you further particulars and convey you to the house. Yours truly, H. WEISS.”

There was no address on the paper and no date, and the writer was unknown to me.

“This note,” I said, “refers to some further particulars. What are they?”

The messenger passed his hand over his hair with a gesture of embarrassment. “It’s a ridiclus affair,” he said, with a contemptuous laugh. “If I had been Mr. Weiss, I wouldn’t have had nothing to do with it. The sick gentleman, Mr. Graves, is one of them people what can’t abear doctors. He’s been ailing now for a week or two, but nothing would induce him to see a doctor. Mr. Weiss did everything he could to persuade him, but it was no go. He wouldn’t. However, it seems Mr. Weiss threatened to send for a medical man on his own account, because, you see, he was getting a bit nervous; and then Mr. Graves gave way. But only on one condition. He said the doctor was to come from a distance and was not to be told who he was or where he lived or anything about him; and he made Mr. Weiss promise to keep to that condition before he’d let him send. So Mr. Weiss promised, and, of course, he’s got to keep his word.”

“But,” I said, with a smile, “you’ve just told me his name—if his name really is Graves.”

“You can form your own opinion on that,” said the coachman.

“And,” I added, “as to not being told where he lives, I can see that for myself. I’m not blind, you know.”

“We’ll take the risk of what you see,” the man replied. “The question is, will you take the job on?”

Yes; that was the question, and I considered it for some time before replying. We medical men are pretty familiar with the kind of person who “can’t abear doctors,” and we like to have as little to do with him as possible. He is a thankless and unsatisfactory patient. Intercourse with him is unpleasant, he gives a great deal of trouble and responds badly to treatment. If this had been my own practice, I should have declined the case off-hand. But it was not my practice. I was only a deputy. I could not lightly refuse work which would yield a profit to my principal, unpleasant though it might be.

As I turned the matter over in my mind, I half unconsciously scrutinized my visitor—somewhat to his embarrassment—and I liked his appearance as little as I liked his mission. He kept his station near the door, where the light was dim—for the illumination was concentrated on the table and the patient’s chair—but I could see that he had a somewhat sly, unprepossessing face and a greasy, red moustache that seemed out of character with his rather perfunctory livery; though this was mere prejudice. He wore a wig, too—not that there was anything discreditable in that—and the thumb-nail of the hand that held his hat bore disfiguring traces of some injury—which, again, though unsightly, in no wise reflected on his moral character. Lastly, he watched me keenly with a mixture of anxiety and sly complacency that I found distinctly unpleasant. In a general way, he impressed me disagreeably. I did not like the look of him at all; but nevertheless I decided to undertake the case.

“I suppose,” I answered, at length, “it is no affair of mine who the patient is or where he lives. But how do you propose to manage the business? Am I to be led to the house blindfolded, like the visitor to the bandit’s cave?”

The man grinned slightly and looked very decidedly relieved.

“No, sir,” he answered; “we ain’t going to blindfold you. I’ve got a carriage outside. I don’t think you’ll see much out of that.”

“Very well,” I rejoined, opening the door to let him out, “I’ll be with you in a minute. I suppose you can’t give me any idea as to what is the matter with the patient?”

“No, sir, I can’t,” he replied; and he went out to see the carriage.

I slipped into a bag an assortment of emergency drugs and a few diagnostic instruments, turned down the gas and
passed out through the surgery. The carriage was standing at the kerb, guarded by the coachman and watched with deep interest by the bottle-boy. I viewed it with mingled curiosity and disfavour. It was a kind of large brougham, such as is used by some commercial travellers, the usual glass windows being replaced by wooden shutters intended to conceal the piles of sample-boxes, and the doors capable of being locked from outside with a railway key.

As I emerged from the house, the coachman unlocked the door and held it open.

“How long will the journey take?” I asked, pausing with my foot on the step.

The coachman considered a moment or two and replied:

“It took me, I should say, nigh upon half an hour to get here.”

This was pleasant hearing. A half an hour each way and a half an hour at the patient’s house. At that rate it would be half-past ten before I was home again, and then it was quite probable that I should find some other untimely messenger waiting on the doorstep. With a muttered anathema on the unknown Mr. Graves and the unrestful life of a locum tenens, I stepped into the inviting vehicle. Instantly the coachman slammed the door and turned the key, leaving me in total darkness.

One comfort was left to me; my pipe was in my pocket. I made shift to load it in the dark, and, having lit it with a wax match, took the opportunity to inspect the interior of my prison. It was a shabby affair. The moth-eaten state of the blue cloth cushions seemed to suggest that it had been long out of regular use; the oil-cloth floor-covering was worn into holes; ordinary internal fittings there were none. But the appearances suggested that the crazy vehicle had been prepared with considerable forethought for its present use. The inside handles of the doors had apparently been removed; the wooden shutters were permanently fixed in their places; and a paper label, stuck on the transom below each window, had a suspicious appearance of having been put there to cover the painted name and address of the job-master or livery-stable keeper who had originally owned the carriage.

These observations gave me abundant food for reflection. This Mr. Weiss must be an excessively conscientious man if he had considered that his promise to Mr. Graves committed him to such extraordinary precautions. Evidently no mere following of the letter of the law was enough to satisfy his sensitive conscience. Unless he had reasons for sharing Mr. Graves’s unreasonable desire for secrecy—for one could not suppose that these measures of concealment had been taken by the patient himself.

The further suggestions that evolved themselves from this consideration were a little disquieting. Whither was I being carried and for what purpose? The idea that I was bound for some den of thieves where I might be robbed and possibly murdered, I dismissed with a smile. Thieves do not make elaborately concerted plans to rob poor devils like me. Poverty has its compensations in that respect. But there were other possibilities. Imagination backed by experience had no difficulty in conjuring up a number of situations in which a medical man might be called upon, with or without coercion, either to witness or actively to participate in the commission of some unlawful act.

Reflections of this kind occupied me pretty actively if not very agreeably during this strange journey. And the monotony was relieved, too, by other distractions. I was, for example, greatly interested to notice how, when one sense is in abeyance, the other senses rouse into a compensating intensity of perception. I sat smoking my pipe in darkness which was absolute save for the dim glow from the smouldering tobacco in the bowl, and seemed to be cut off from all knowledge of the world without. But yet I was not. The vibrations of the carriage, with its hard springs and iron-tired wheels, registered accurately and plainly the character of the roadway. The harsh rattle of granite setts, the soft bumpiness of macadam, the smooth rumble of wood-pavement, the jarring and swerving of crossed tram-lines; all were easily recognizable and together sketched the general features of the neighbourhood through which I was passing. And the sense of hearing filled in the details. Now the hoot of a tug’s whistle told of proximity to the river. A sudden and brief hollow reverberation announced the passage under a railway arch (which, by the way, happened several times during the journey); and, when I heard the familiar whistle of a railway-guard followed by the quick snorts of a skidding locomotive, I had as clear a picture of a heavy passenger-train moving out of a station as if I had seen it in broad daylight.

I had just finished my pipe and knocked out the ashes on the heel of my boot, when the carriage slowed down and entered a covered way—as I could tell by the hollow echoes. Then I distinguished the clang of heavy wooden gates closed behind me, and a moment or two later the carriage door was unlocked and opened. I stepped out blinking into a covered passage paved with cobbles and apparently leading down to a mews; but it was all in darkness, and I had no time to make any detailed observations, as the carriage had drawn up opposite a side door which was open and in which stood a woman holding a lighted candle.

“Is that the doctor?” she asked, speaking with a rather pronounced German accent and shading the candle with her hand as she peered at me.

I answered in the affirmative, and she then exclaimed:

“I am glad you have come. Mr. Weiss will be so relieved. Come in, please.”

I followed her across a dark passage into a dark room, where she set the candle down on a chest of drawers and turned to depart. At the door, however, she paused and looked back.

“It is not a very nice room to ask you into,” she said. “We are very untidy just now, but you must excuse us. We have had so much anxiety about poor Mr. Graves.”
He has been ill some time, then?"

"Yes. Some little time. At intervals, you know. Sometimes better, sometimes not so well."

As she spoke, she gradually backed out into the passage but did not go away at once. I accordingly pursued my inquiries.

"He has not been seen by any doctor, has he?"

"No," she answered, "he has always refused to see a doctor. That has been a great trouble to us. Mr. Weiss has been very anxious about him. He will be so glad to hear that you have come. I had better go and tell him. Perhaps you will kindly sit down until he is able to come to you," and with this she departed on her mission.

It struck me as a little odd that, considering his anxiety and the apparent urgency of the case, Mr. Weiss should not have been waiting to receive me. And when several minutes elapsed without his appearing, the oddness of the circumstance impressed me still more. Having no desire, after the journey in the carriage, to sit down, I whiled away the time by an inspection of the room. And a very curious room it was; bare, dirty, neglected and, apparently, unused. A faded carpet had been flung untidily on the floor. A small, shabby table stood in the middle of the room; and beyond this, three horsehair-covered chairs and a chest of drawers formed the entire set of furniture. No pictures hung on the mouldy walls, no curtains covered the shuttered windows, and the dark drapery of cobwebs that hung from the ceiling to commemorate a long and illustrious dynasty of spiders hinted at months of neglect and disuse.

The chest of drawers—an incongruous article of furniture for what seemed to be a dining-room—as being the nearest and best lighted object received most of my attention. It was a fine old chest of nearly black mahogany, very battered and in the last stage of decay, but originally a piece of some pretensions. Regretful of its fallen estate, I looked it over with some interest and had just observed on its lower corner a little label bearing the printed inscription "Lot 201" when I heard footsteps descending the stairs. A moment later the door opened and a shadowy figure appeared standing close by the threshold.

"Good evening, doctor," said the stranger, in a deep, quiet voice and with a distinct, though not strong, German accent. "I must apologize for keeping you waiting."

I acknowledged the apology somewhat stiffly and asked: "You are Mr. Weiss, I presume?"

"Yes, I am Mr. Weiss. It is very good of you to come so far and so late at night and to make no objection to the absurd conditions that my poor friend has imposed."

"Not at all," I replied. "It is my business to go when and where I am wanted, and it is not my business to inquire into the private affairs of my patients."

"That is very true, sir," he agreed cordially, "and I am much obliged to you for taking that very proper view of the case. I pointed that out to my friend, but he is not a very reasonable man. He is very secretive and rather suspicious by nature."

"So I inferred. And as to his condition; is he seriously ill?"

"Ah," said Mr. Weiss, "that is what I want you to tell me. I am very much puzzled about him."

"But what is the nature of his illness? What does he complain of?"

"He makes very few complaints of any kind although he is obviously ill. But the fact is that he is hardly ever more than half awake. He lies in a kind of dreamy stupor from morning to night."

This struck me as excessively strange and by no means in agreement with the patient's energetic refusal to see a doctor.

"But," I asked, "does he never rouse completely?"

"Oh, yes," Mr. Weiss answered quickly; "he rouses from time to time and is then quite rational, and, as you may have gathered, rather obstinate. That is the peculiar and puzzling feature in the case; this alternation between a state of stupor and an almost normal and healthy condition. But perhaps you had better see him and judge for yourself. He had a rather severe attack just now. Follow me, please. The stairs are rather dark."

The stairs were very dark, and I noticed that they were without any covering of carpet, or even oil-cloth, so that our footsteps resounded dizzingly as if we were in an empty house. I stumbled up after my guide, feeling my way by the hand-rail, and on the first floor followed him into a room similar in size to the one below and very barely furnished, though less squalid than the other. A single candle at the farther end threw its feeble light on a figure in the bed, leaving the rest of the room in a dim twilight.

As Mr. Weiss tiptoed into the chamber, a woman—the one who had spoken to me below—rose from a chair by the bedside and quietly left the room by a second door. My conductor halted, and looking fixedly at the figure in the bed, called out:

"Philip! Philip! Here is the doctor come to see you."

He paused for a moment or two, and, receiving no answer, said: "He seems to be dozing as usual. Will you go and see what you can make of him?"

I stepped forward to the bedside, leaving Mr. Weiss at the end of the room near the door by which we had entered, where he remained, slowly and noiselessly pacing backwards and forwards in the semi-obscurity. By the light of the candle I saw
an elderly man with good features and a refined, intelligent and even attractive face, but dreadfully emaciated, bloodless and sallow. He lay quite motionless except for the scarcely perceptible rise and fall of his chest; his eyes were nearly closed, his features relaxed, and, though he was not actually asleep, he seemed to be in a dreamy, somnolent, lethargic state, as if under the influence of some narcotic.

I watched him for a minute or so, timing his slow breathing by my watch, and then suddenly and sharply addressed him by name; but the only response was a slight lifting of the eyelids, which, after a brief, drowsy glance at me, slowly subsided to their former position.

I now proceeded to make a physical examination. First, I felt his pulse, grasping his wrist with intentional brusqueness in the hope of rousing him from his stupor. The beats were slow, feeble and slightly irregular, giving clear evidence, if any were needed, of his generally lowered vitality. I listened carefully to his heart, the sounds of which were very distinct through the thin walls of his emaciated chest, but found nothing abnormal beyond the feebleness and uncertainty of its action. Then I turned my attention to his eyes, which I examined closely with the aid of the candle and my opthalmoscope, raising the lids somewhat roughly so as to expose the whole of the irides. He submitted without resistance to my rather ungentle handling of these sensitive structures, and showed no signs of discomfort even when I brought the candle-flame to within a couple of inches of his eyes.

But this extraordinary tolerance of light was easily explained by closer examination; for the pupils were contracted to such an extreme degree that only the very minutest point of black was visible at the centre of the grey iris. Nor was this the only abnormal peculiarity of the sick man's eyes. As he lay on his back, the right iris sagged down slightly towards its centre, showing a distinctly concave surface; and, when I contrived to produce a slight but quick movement of the eyeball, a perceptible undulatory movement could be detected. The patient had, in fact, what is known as a tremulous iris, a condition that is seen in cases where the crystalline lens has been extracted for the cure of cataract, or where it has become accidentally displaced, leaving the iris unsupported. In the present case, the complete condition of the iris made it clear that the ordinary extraction operation had not been performed, nor was I able, on the closest inspection with the aid of my lens, to find any trace of the less common "needle operation." The inference was that the patient had suffered from the accident known as "dislocation of the lens"; and this led to the further inference that he was almost or completely blind in the right eye.

This conclusion was, indeed, to some extent negatived by a deep indentation on the bridge of the nose, evidently produced by spectacles, and by marks which I looked for and found behind the ears, corresponding to the hooks or "curl sides" of the glasses. For those spectacles which are fitted with curl sides to hook over the ears are usually intended to be worn habitually, and this agreed with the indentation on the nose; which was deeper than would have been accounted for by the merely occasional use of spectacles for reading. But if only one eye was useful, a single eye-glass would have answered the purpose; not that there was any weight in this objection, for a single eye-glass worn constantly would be much less convenient than a pair of hook-sided spectacles.

As to the nature of the patient's illness, only one opinion seemed possible. It was a clear and typical case of opium or morphine poisoning. To this conclusion all his symptoms seemed to point with absolute certainty. The coated tongue, which he protruded slowly and tremulously in response to a command bawled in his ear; his yellow skin and ghastly expression; his contracted pupils and the stupor from which he could hardly be roused by the roughest handling and which yet did not amount to actual insensibility; all these formed a distinct and coherent group of symptoms, not only pointing plainly to the nature of the drug, but also suggesting a very formidable dose.

But this conclusion in its turn raised a very awkward and difficult question. If a large—a poisonous—dose of the drug had been taken, how, and by whom had that dose been administered? The closest scrutiny of the patient's arms and legs failed to reveal a single mark such as would be made by a hypodermic needle. This man was clearly no common morphinomaniac; and in the absence of the usual sprinkling of needle-marks, there was nothing to show or suggest whether the drug had been taken voluntarily by the patient himself or administered by someone else.

And then there remained the possibility that I might, after all, be mistaken in my diagnosis. I felt pretty confident. But the wise man always holds a doubt in reserve. And, in the present case, having regard to the obviously serious condition of the patient, such a doubt was eminently disturbing. Indeed, as I pocketed my stethoscope and took a last look at the motionless, silent figure, I realized that my position was one of extraordinary difficulty and perplexity. On the one hand my suspicions—aroused, naturally enough, by the very unusual circumstances that surrounded my visit—inclined me to extreme reticence; while, on the other, it was evidently my duty to give any information that might prove serviceable to the patient.

As I turned away from the bed Mr. Weiss stopped his slow pacing to and fro and faced me. The feeble light of the candle now fell on him, and I saw him distinctly for the first time. He did not impress me favourably. He was a thick-set, round-shouldered man, a typical fair German with tow-coloured hair, greased and brushed down smoothly, a large, ragged, sandy beard and coarse, sketchy features. His nose was large and thick with a bulbous end, and inclined to a reddish purple, a tint which extended to the adjacent parts of his face as if the colour had run. His eyebrows were large and beetling, overhanging deep-set eyes, and he wore a pair of spectacles which gave him a somewhat owlish expression. His exterior was unprepossessing, and I was in a state of mind that rendered me easily receptive of an unfavourable impression.

"Well," he said, "what do you make of him?" I hesitated, still perplexed by the conflicting necessities of caution and frankness, but at length replied:
"I think rather badly of him, Mr. Weiss. He is in a very low state."

"Yes, I can see that. But have you come to any decision as to the nature of his illness?"

There was a tone of anxiety and suppressed eagerness in the question which, while it was natural enough in the circumstances, by no means allayed my suspicions, but rather influenced me on the side of caution.

"I cannot give a very definite opinion at present," I replied guardedly. "The symptoms are rather obscure and might very well indicate several different conditions. They might be due to congestion of the brain, and, if no other explanation were possible, I should incline to that view. The alternative is some narcotic poison, such as opium or morphia."

"But that is quite impossible. There is no such drug in the house, and as he never leaves his room now, he could not get any from outside."

"What about the servants?" I asked.

"There are no servants excepting my housekeeper, and she is absolutely trustworthy."

"He might have some store of the drug that you are not aware of. Is he left alone much?"

"Very seldom indeed. I spend as much time with him as I can, and when I am not able to be in the room, Mrs Schallibaum, my housekeeper, sits with him."

"Is he often as drowsy as he is now?"

"Oh, very often; in fact, I should say that is his usual condition. He rouses up now and again, and then he is quite lucid and natural for, perhaps, an hour or so; but presently he becomes drowsy again and doeses off, and remains asleep, or half asleep, for hours on end. Do you know of any disease that takes people in that way?"

"No," I answered. "The symptoms are not exactly like those of any disease that is known to me. But they are much very like those of opium poisoning."

"But, my dear sir," Mr. Weiss retorted impatiently, "since it is clearly impossible that it can be opium poisoning, it must be something else. Now, what else can it be? You were speaking of congestion of the brain."

"Yes. But the objection to that is the very complete recovery that seems to take place in the intervals."

"I would not say very complete," said Mr. Weiss. "The recovery is rather comparative. He is lucid and fairly natural in his manner, but he is still dull and lethargic. He does not, for instance, show any desire to go out, or even to leave his room."

I pondered uncomfortably on these rather contradictory statements. Clearly Mr. Weiss did not mean to entertain the theory of opium poisoning; which was natural enough if he had no knowledge of the drug having been used. But still—

"I suppose," said Mr. Weiss, "you have experience of sleeping sickness?"

The suggestion startled me. I had not. Very few people had. At that time practically nothing was known about the disease. It was a mere pathological curiosity, almost unheard of excepting by a few practitioners in remote parts of Africa, and hardly referred to in the text-books. Its connection with the trypanosome-bearing insects was as yet unsuspected, and, to me, its symptoms were absolutely unknown.

"No, I have not," I replied. "The disease is nothing more than a name to me. But why do you ask? Has Mr. Graves been abroad?"

"Yes. He has been travelling for the last three or four years, and I know that he spent some time recently in West Africa, where this disease occurs. In fact, it was from him that I first heard about it."

This was a new fact. It shook my confidence in my diagnosis very considerably, and inclined me to reconsider my suspicions. If Mr. Weiss was lying to me, he now had me at a decided disadvantage.

"What do you think?" he asked. "Is it possible that this can be sleeping sickness?"

"I should not like to say that it is impossible," I replied. "The disease is practically unknown to me. I have never practised out of England and have had no occasion to study it. Until I have looked the subject up, I should not be in a position to give an opinion. Of course, if I could see Mr. Graves in one of what we may call his 'lucid intervals' I should be able to form a better idea. Do you think that could be managed?"

"It might. I see the importance of it and will certainly do my best; but he is a difficult man; a very difficult man. I sincerely hope it is not sleeping sickness."

"Why?"

"Because—as I understood from him—that disease is invariably fatal, sooner or later. There seem to be no cure. Do you think you will be able to decide when you see him again?"

"I hope so," I replied. "I shall look up the authorities and see exactly what the symptoms are—that is, so far as they are known; but my impression is that there is very little information available."

"And in the meantime?"

"We will give him some medicine and attend to his general condition, and you had better let me see him again as soon as
possible.” I was about to say that the effect of the medicine itself might throw some light on the patient’s condition, but, as I proposed to treat him for morphine poisoning, I thought it wiser to keep this item of information to myself. Accordingly, I confined myself to a few general directions as to the care of the patient, to which Mr. Weiss listened attentively. “And,” I concluded, “we must not lose sight of the opium question. You had better search the room carefully and keep a close watch on the patient, especially during his intervals of wakefulness.”

“Very well, doctor,” Mr. Weiss replied, “I will do all that you tell me and I will send for you again as soon as possible, if you do not object to poor Graves’s ridiculous conditions. And now, if you will allow me to pay your fee, I will go and order the carriage while you are writing the prescription.”

“There is no need for a prescription,” I said. “I will make up some medicine and give it to the coachman.”

Mr. Weiss seemed inclined to demur to this arrangement, but I had my own reasons for insisting on it. Modern prescriptions are not difficult to read, and I did not wish Mr. Weiss to know what treatment the patient was having.

As soon as I was left alone, I returned to the bedside and once more looked down at the impassive figure. And as I looked, my suspicions revived. It was very like morphine poisoning; and, if it was morphine, it was no common, medicinal dose that had been given. I opened my bag and took out my hypodermic case from which I extracted a little tube of atropine tabloids. Shaking out into my hand a couple of the tiny discs, I drew down the patient’s under-lip and slipped the little tablets under his tongue. Then I quickly replaced the tube and dropped the case into my bag; and I had hardly done so when the door opened softly and the housekeeper entered the room.

“How do you find Mr. Graves?” she asked in what I thought a very unnecessarily low tone, considering the patient’s lethargic state.

“He seems to be very ill,” I answered.

“So!” she rejoined, and added: “I am sorry to hear that. We have been anxious about him.”

She seated herself on the chair by the bedside, and, shading the candle from the patient’s face—and her own, too—produced from a bag that hung from her waist a half-finished stocking and began to knit silently and with the skill characteristic of the German housewife. I looked at her attentively (though she was so much in the shadow that I could see her but indistinctly) and somehow her appearance prepossessed me as little as did that of the other members of the household. Yet she was not an ill-looking woman. She had an excellent figure, and the air of a person of good social position; her features were good enough and her colouring, although a little unusual, was not unpleasant. Like Mr. Weiss, she had very fair hair, greased, parted in the middle and brushed down as smoothly as the painted hair of a Dutch doll. She appeared to have no eyebrows at all—owing, no doubt, to the light colour of the hair—and the doll-like character was emphasized by her eyes, which were either brown or dark grey, I could not see which. A further peculiarity consisted in a “habit spasm,” such as one often sees in nervous children; a periodical quick jerk of the head, as if a cap-string or dangling lock were being shaken off the cheek. Her age I judged to be about thirty-five.

The carriage, which one might have expected to be waiting, seemed to take some time in getting ready. I sat, with growing impatience, listening to the sick man’s soft breathing and the click of the housekeeper’s knitting-needles. I wanted to get home, not only for my own sake; the patient’s condition made it highly desirable that the remedies should be given as quickly as possible. But the minutes dragged on, and I was on the point of expostulating when a bell rang on the landing.

“The carriage is ready,” said Mrs. Schallibaum. “Let me light you down the stairs.”

She rose, and, taking the candle, preceded me to the head of the stairs, where she stood holding the light over the baluster-rail as I descended and crossed the passage to the open side door. The carriage was drawn up in the covered way as I could see by the faint glimmer of the distant candle; which also enabled me dimly to discern the coachman standing close by in the shadow. I looked round, rather expecting to see Mr. Weiss, but, as he made no appearance, I entered the carriage. The door was immediately banged to and locked, and I then heard the heavy bolts of the gates withdrawn and the loud creaking of hinges. The carriage moved out slowly and stopped; the gates slammed to behind me; I felt the lurch as the coachman climbed to his seat and we started forward.

My reflections during the return journey were the reverse of agreeable. I could not rid myself of the conviction that I was being involved in some very suspicious proceedings. It was possible, of course, that this feeling was due to the strange secrecy that surrounded my connection with this case; that, had I made my visit under ordinary conditions, I might have found in the patient’s symptoms nothing to excite suspicion or alarm. It might be so, but that consideration did not comfort me.

Then, my diagnosis might be wrong. It might be that this was, in reality, a case of some brain affection accompanied by compression, such as slow haemorrhage, abscess, tumour or simple congestion. These cases were very difficult at times. But the appearances in this one did not consistently agree with the symptoms accompanying any of these conditions. As to sleeping sickness, it was, perhaps a more hopeful suggestion, but I could not decide for or against it until I had more knowledge; and against this view was the weighty fact that the symptoms did exactly agree with the theory of morphine poisoning.

But even so, there was no conclusive evidence of any criminal act. The patient might be a confirmed opium-eater, and the symptoms heightened by deliberate deception. The cunning of these unfortunate is proverbial and is only equalled by their secretiveness and mendacity. It would be quite possible for this man to feign profound stupor so long as he was
watched, and then, when left alone for a few minutes, to nip out of bed and help himself from some secret store of the drug. This would be quite in character with his objection to seeing a doctor and his desire for secrecy. But still, I did not believe it to be the true explanation. In spite of all the various alternative possibilities, my suspicions came back to Mr. Weiss and the strange, taciturn woman, and refused to budge.

For all the circumstances of the case were suspicious. The elaborate preparations implied by the state of the carriage in which I was travelling; the make-shift appearance of the house; the absence of ordinary domestic servants, although a coachman was kept; the evident desire of Mr. Weiss and the woman to avoid thorough inspection of their persons; and, above all, the fact that the former had told me a deliberate lie. For he had lied, beyond all doubt. His statement as to the almost continuous stupor was absolutely irreconcilable with his other statement as to the patient’s wilfulness and obstinacy and even more irreconcilable with the deep and comparatively fresh marks of the spectacles on the patient’s nose. That man had certainly worn spectacles within twenty-four hours, which he would hardly have done if he had been in a state bordering on coma.

My reflections were interrupted by the stopping of the carriage. The door was unlocked and thrown open, and I emerged from my dark and stuffy prison opposite my own house.

“I will let you have the medicine in a minute or two,” I said to the coachman; and, as I let myself in with my latch-key, my mind came back swiftly from the general circumstances of the case to the very critical condition of the patient. Already I was regretting that I had not taken more energetic measures to rouse him and restore his flagging vitality; for it would be a terrible thing if he should take a turn for the worse and die before the coachman returned with the remedies. Spurred on by this alarming thought, I made up the medicines quickly and carried the hastily wrapped bottles out to the man, whom I found standing by the horse’s head.

"Get back as quickly as you can,” I said, “and tell Mr. Weiss to lose no time in giving the patient the draught in the small bottle. The directions are on the labels.”

The coachman took the packages from me without reply, climbed to his seat, touched the horse with his whip and drove off at a rapid pace towards Newington Butts.

The little clock in the consulting-room showed that it was close on eleven; time for a tired G.P. to be thinking of bed. But I was not sleepy. Over my frugal supper I found myself taking up anew the thread of my meditations, and afterwards, as I smoked my last pipe by the expiring surgery fire, the strange and sinister features of the case continued to obtrude themselves on my notice. I looked up Stillbury’s little reference library for information on the subject of sleeping sickness, but learned no more than that it was “a rare and obscure disease of which very little was known at present.” I read up morphine poisoning and was only further confirmed in the belief that my diagnosis was correct; which would have been more satisfactory if the circumstances had been different.

For the interest of the case was not merely academic. I was in a position of great difficulty and responsibility and had to decide on a course of action. What ought I to do? Should I maintain the professional secrecy to which I was tacitly committed, or ought I to convey a hint to the police?

Suddenly, and with a singular feeling of relief, I bethought myself of my old friend and fellow-student, John Thorndyke, now an eminent authority on Medical Jurisprudence. I had been associated with him temporarily in one case as his assistant, and had then been deeply impressed by his versatile learning, his acuteness and his marvellous resourcefulness. Thorndyke was a barrister in extensive practice, and so would be able to tell me at once what was my duty from a legal point of view; and, as he was also a doctor of medicine, he would understand the exigencies of medical practice. If I could find time to call at the Temple and lay the case before him, all my doubts and difficulties would be resolved.

Anxiously, I opened my visiting-list to see what kind of day’s work was in store for me on the morrow. It was not a heavy day, even allowing for one or two extra calls in the morning, but yet I was doubtful whether it would allow of my going so far from my district, until my eye caught, near the foot of the page, the name of Burton. Now Mr. Burton lived in one of the old houses on the east side of Bouverie Street, less than five minutes’ walk from Thorndyke’s chambers in King’s Bench Walk; and he was, moreover, a “chronic” who could safely be left for the last. When I had done with Mr. Burton I could look in on my friend with a very good chance of catching him on his return from the hospital. I could allow myself time for quite a long chat with him, and, by taking a hansom, still get back in good time for the evening’s work.

This was a great comfort. At the prospect of sharing my responsibilities with a friend on whose judgment I could so entirely rely, my embarrassments seemed to drop from me in a moment. Having entered the engagement in my visiting-list, I rose, in greatly improved spirits, and knocked out my pipe just as the little clock banged out impatiently the hour of midnight.

II. — THORNDYKE DEVISES A SCHEME
